Semi-Annual Index of

THE IRON AGE

July—December, 1928

VOL. CXXII

THE IRON AGE PUBLISHING CO.

239 West 39th Street

NEW YORK

INDEX

Illustrated articles indicated by *

A

- Abbott, Charles F.:**
New Forces in Business, Nov 29 p 1364
Selling Code Is Prime Need, Nov 8 p 1180

Accidents:

- Eye and Industrial Eye Strain, Dec 27 p 1634
In Non - Ferrous Metallurgical Works 1926, Aug 16 p 412
Safety Contests Reduce, Aug 16 p 416

Acetylene Association:

- (See International Acetylene Association)

Acheson, Dr. Edward G.:

- Establishes Prize Fund for Electrochemical Society*, Sept 27 p 775

Acme Steel Co.:

- Top-Fired Annealing Furnace Installation*, July 26 p 211

Advertising:

- Industrial, Bok Award Announcement, Sept 27 p 774

Aeronautics:

- Meeting of American Society of Mechanical Engineers, Oct 4 p 837; Oct 11 p 893

Aetna-Standard Engineering Co.:

- Acquires Tin Plate Pickling Process, Dec 13 p 1531

Agnew Electric Welder Co.:

- Multiple Spot Welder*, July 19 p 145

Air Compressors:

- Pontiac Self-Propelled*, Sept 6 p 582

Aircraft:

- Conquest of the Air (Editorial), Oct 25 p 1046
Exports, July 19 p 165; (Editorial) Sept 6 p 586
Goodyear-Zeppelin Corporation to Build Hangar, Oct 11 p 921
Industry Near Philadelphia*, Nov 15 p 1211
Joints, Department of Commerce to Test, Nov 22 p 1336
Manufacture by Butler Mfg. Co., Nov 22 p 1335
Mass Production of Airplanes Planned, Oct 11 p 893
Metal Fuselage in European, Sept 27 p 764
Stainless Iron for Naval*, Sept 13 p 627
Steel Failures, Oct 18 p 958
Steel Requirements for Industry, Nov 8 p 1161

Airplane Industry (Editorial), Dec 20 p 1594

Air Reduction Sales Co.:

- Blowpipes*, Aug 2 p 288
General Purpose Cutting Torch*, Oct 4 p 830

Ajax Electrothermic Corporation:

- High-Frequency Electric Induction Furnace*, Nov 22 p 1303

Alexander, Magnus W.:

- Better Planning of Production Crux of Distribution Problem, July 12 p 83

Alford and Hannum:

- "Kilo-Man-Hour" Production, Dec 13 p 1501

Allderdice, Taylor:

- Resigns Presidency National Tube Co., Dec 27 p 1677

Allegheny Steel Co.:

- Increases Group Insurance, Sept 20 p 710

Allen, Alonzo F.:

- Secretary-Treasurer American Steel & Wire Co., Sept 27 p 801

Allen, Henry E.:

- Tool Steels, Sept 20 p 688

Allis-Chalmers Mfg. Co.:

- Inclosed Fan-Cooled Motor*, Dec 27 p 1645

Alloy Steel:

- Bridge 60 Years Old*, Sept 20 p 633, (Editorial) p 702
Chrome Nickel, American Companies to Use Krupp Patent, Nov 8 p 1167
Chrome-Tungsten at High Temperatures, Dec 20 p 1556
Developments, Review*, Sept 27 p 741
Experiments with Manganese*, Dec 13 p 1499
For Rails, Oct 4 p 826
High Price Prevents Wide Use, Sept 13 p 633
Machining Manganese (Editorial), Dec 13 p 1521
Mushet First Maker of Alloy Tools, Nov 15 p 1213
Nickel, Making Large Plates of*, Dec 13 p 1492
Requirements for Aircraft Industry, Nov 8 p 1161
Rust, Acid and Heat Resisting, Nov 8 p 1164
Used by Automotive Industry, Nov 1 p 1092

Alloys:

- Aluminum, Replaces Steel Castings on Field Gun Mounts*, Sept 6 p 574
As Substitutes for Diamond Dies, Aug 16 p 392
Heat-Resisting, Sept 27 p 743
High Temperature Resistance, Oct 11 p 882
Hyb-lum, New Aluminum, Aug 16 p 433
Ni-Chrom-Al, Sept 27 p 743
Nickel-Chromium Resistance Wires, Dec 13 p 1491
Tool, Containing No Carbon*, Dec 20 p 1572
Tungsten Carbide, Oct 18 p 959, (Editorial) p 972; Nov 29 p 1380
Widia, Nov 29 p 1380

Aluminum:

- European Cartel Continued, Nov 8 p 1172
World Productive Capacity, Oct 4 p 817, (Editorial) p 817

Aluminum Plate:

- Has Tin Plate a New Competitor? Dec 20 p 1555

American Broach & Machine Co.:

- Hydraulic Broaching Press*, Nov 22 p 1307

American Brown Boveri Electric Corporation:

- Blast Furnace Turbo-Blower*, Aug 16 p 395

American Electrochemical Society:

- Convention Proceedings, Sept 27 p 775
Establishes \$100 Prize, Aug 23 p 474

American Engineering Standards Committee:

- Activities, Aug 9 p 342
Succeeded by American Standards Association, July 12 p 84

American Foundrymen's Association:

- (See Foundrymen's Associations)

American Gas Association:

- Testing Laboratory*, Sept 27 p 776

American Gear Manufacturers' Association:

- Convention Proceedings, Oct 18 p 948

American Heat Economy Bureau, Inc.:

- Automatic Control Equipment, Dec 6 p 1441

American Institute of Steel Construction:

- Convention Proceedings, Nov 15 p 1235; Nov 22 p 1288
Specifications Adopted by Municipalities, Dec 6 p 1445

American Institute of Weights and Measures:

- Nominations, Nov 8 p 1173

American Iron and Steel Institute:

- 1927 Annual Statistical Report, Aug 2 p 303
Fall Meeting Proceedings, Nov 1 p 1085
Pig Iron Production First Half, Aug 16 pp 406, 407

- Steel Ingot Production by Months*, June, p 95; July, p 376; August, p 641; September, p 907; October, p 1239; November, p 1516

- Trackwork Output, June, p 166; July, p 429; August, p 671; September, p 987; October, p 1257

- Weir, E. T., Director*, July 5 p 60

American LaFrance & Foamite Corporation:

- New Gas for Protection Against Fire, Nov 1 p 1114

American Management Association:

- Convention Proceedings, Nov 22 p 1291

American Manganese Producers' Association:

- Convention Proceedings, Sept 13 p 649

American Manganese Steel Co.:

- Pumping Units*, Aug 16 p 402
Transforms Iron Foundry Into Electric Manganese Steel Castings Plant*, July 12 p 79

American Mining Congress:

- Convention Program, Nov 22 p 1319

American Pulley Co.:

- Rack for Hand Trucks*, Nov 15 p 1230

- American Radiator Co.:**
To Merge with Standard Sanitary Mfg. Co., Dec 20 p 1579
- American Railway Association:**
Railroad Expenditures Nine Months, Nov 29 p 1378
- American Tin Trade Association:**
Officers, Nov 29 p 1406
- American Refractories Institute:**
Fall Meeting Proceedings, Nov 1 p 1112
- American Rolling Mill Co.:**
Cash Discount on Sheets, Aug 2 p 315, (Editorial) p 301
Purchases Ashland Steel Co., July 26 p 224
Use of Oil-Electric Locomotives*, Oct 11 p 895
- American Sheet & Tin Plate Co.:**
Sheet Discount, Aug 23 p 479
Simplified Brands for Sheet Steel, Oct 25 p 1052
- American Society for Steel Treating:**
Convention Proceedings, Oct 18 p 953
Exhibitors at National Metal Show, Sept 27 p 752
Indianapolis Chapter Officers, Aug 2 p 288
Products at National Metal Exhibition*, Sept 27 p 741
Program for Western Metal Congress, Dec 6 p 1458; Dec 13 p 1515
- American Society for Testing Materials:**
Convention Proceedings, July 5 p 28
Forms Non-Ferrous Ingot Committee, Dec 13 p 1542
- American Society of Mechanical Engineers:**
Aeronautic Meeting, Oct 4 p 837; Oct 11 p 893
Committee on Heavy-Duty Anti-Friction Bearings, Nov 15 p 1234
Iron and Steel Division Convention Proceedings, Nov 22 p 1301
Machine Shop Practice Meeting, Sept 27 p 774; Oct 4 p 822
National Fuels Meeting, Sept 27 p 769
New England Industries Convention Proceedings, Oct 11 p 898
Plans Research on Wire Rope, Oct 25 p 1041
Progress in Iron and Steel Work, Dec 27 p 1626
Research on Strength of Jacketed Vessels, Sept 27 p 800
Summer Convention Proceedings, Aug 30 p 533; Sept 6 p 589
- American Standards Association:**
To Succeed American Engineering Standards Committee, July 12 p 84
- American Steel & Wire Co.:**
Acoustic Laboratory for Testing Music and Other Steel Wires*, Nov 1 p 1087
Allen, Alonzo F., Secretary-Treasurer*, Sept 27 p 801
- American Steel Engineering Co.:**
Fabricating Plant*, Dec 6 p 1433
- American Steel Foundries:**
Locomotive Frames Cast on Edge*, Nov 22 p 1286
Steel Foundry Laboratory*, Aug 2 p 280
- American Telephone & Telegraph Co.:**
Business Forecasts*, Dec 13 p 1437
- American Welding Society:**
Convention Proceedings, Oct 25 p 1025
Milwaukee Branch Formed, Dec 20 p 1616
- Ames, B. C., Co.:**
Amplifying Comparator*, Nov 22 p 1305
- Anderson Die Machine Co.:**
Horizontal Drilling and Tapping Machine*, Aug 2 p 287
- Anglo-Oriental Mining Corporation:**
Merger of Malayan Tin Companies, Sept 27 p 775
- Annealing:**
(See Heat Treatment)
- Annealing Pots:**
Chicago Stainless Iron*, Dec 6 p 1438
Mossberg Welded, Dec 6 p 1438
- Anti-Trust Law:**
Repeal Unnecessary, Nov 22 p 1282
- Apollo Metal Works.:**
Manufactures Bonded Chrome Sheet, Sept 20 p 729
- Apprentices:**
Ford School*, Sept 13 p 631
Foundry, Leaves from a Diary, Aug 23 p 464
Milwaukee Metal Trades Dinner, Oct 11 p 902
More, Fewer Unemployed, July 5 p 24
Profits from Training*, Oct 11 p 879
Training at Lynn Plant of General Electric Co., Oct 11 p 898
- Anthony Co.:**
Fuel Oil Strainers*, July 12 p 92
- Armco Distributors' Association of America:**
Annual Meeting, Dec 27 p 1656
- Armstrong, H. C.:**
Fuel Control in Forge and Rolling Mill Practice, Dec 20 p 1585
- Ashland Steel Co.:**
Purchased by American Rolling Mill Co., July 26 p 224
- Association of Consulting Chemists and Chemical Engineers.:**
Organized, Nov 22 p 1319
- Association of Iron and Steel Electrical Engineers:**
Convention Proceedings, July 5 p 31
Convention Program Combustion Engineering Division, Dec 27 p 1678
- Association of Manufacturers of Wood Working Machinery:**
Adopts Trade Practice Rules, Dec 20 p 1587
- Aston Process:**
Byers Company to Build Plant for Use of, Nov 1 p 1115
- Austenite:**
New Determination of Boundaries*, Sept 6 p 570
- Austin Co.:**
Building with Welded Frame*, Nov 15 p 1224
- Australia:**
Iron and Steel Industry, July 19 p 162
- Automobiles:**
Industry Prosperous (Editorial), Nov 29 p 1384
Lake Transportation of*, Sept 20 p 689
Manufacture of Frames in Midland Plant*, July 5 p 19
Output, Light Gains (Editorial), Aug 30 p 532
Production by Months, June, p 226; July, p 442, 502, 533; August, p 772; September, p 905, 1116; October p 1195
Single Stamping for Sedan Side*, Sept 13 p 623
Taking More Steel (Editorial), Nov 1 p 1119
- Automotive Engineers:**
(See Society of Automotive Engineers)
- Automotive Gear Works, Inc.:**
Automatic Furnace Control for Hardening*, Sept 6 p 579
- Automotive Industry:**
Steels Used by, Nov 1 p 1093
- Aviation Beacons:**
Steel Tower Supports*, Dec 27 p 1674
- Axles:**
Ford Method of Making Front*, Aug 23 p 457
- Ayres, Col. Leonard P.:**
Business Prospect, Nov 22 p 1299

B

- Baker Brothers, Inc.:**
Hydraulic-Feed Horizontal Boring Machines*, Dec 6 p 1439
- Baker, David:**
Blast Furnace Metal for Castings, Dec 13 p 1501
- Baker Iron Works:**
Merged with Llewellyn and Union Iron Works, Dec 20 p 1590
- Baker-Raulang Co.:**
Articulating Truck*, Dec 6 p 1439
- Balzola, José:**
Iron Ore Mining in Vizcaya, Oct 18 p 951
- Band Saw:**
De Walt for 7-in. Material*, Sept 6 p 580
- Baron, L. A.:**
Profits by Close Material Control*, Oct 25 p 1009
Stutz Motor Co. Budget Plan*, Aug. 9 p 333
- Bars:**
Cold Finished Steel, Bliss & Laughlin to Make, Aug 23 p 496
Concrete, Lower Duty Upheld, Nov 29 p 1379
Hollow Rolled Staybolt, Burden Iron Co., Acquires Right to Manufacture, Dec 27 p 1678
Scully Boring and Turning*, Aug 23 p 469
- Bausch & Lomb Optical Co.:**
75th Anniversary, Aug 23 p 479
- Beacons, Aviation:**
On Steel Towers*, Dec 27 p 1674
- Bearing Bronzes:**
Wear Testing, July 19 p 142
- Bearings:**
Anti-Friction for Electric Motors, July 5 p 31
Anti-Friction, for Roll Necks, July 5 p 31
Anti-Friction, Heavy-Duty, Dec 20 p 1563
Roller, in Four-High Mill, July 12 p 101
- Beaumont Iron Works:**
Vs. Duron—Factory Held an "Attractive Nuisance*", Sept 27 p 767
- Belgium:**
Industry and Finance Sound, Oct 4 p 868, (Editorial) p 842
- Bemis & Call Hardware & Tool Co.:**
Purchases Coes Wrench Co., Dec 27 p 1674
- Bend Tests:**
Extensometer for*, Sept 6 p 575
- Bending Roll:**
Buffalo, No. 0*, Nov 8 p 1170
- Bentley, J. Lloyd:**
Fuel Control in Open-Hearth Furnaces, Dec 20 p 1585

Berg, Cris:

Output Increased by Systematic Scheduling of Shop Work*, July 5 p 1

Bertram, E.:

Blowing Materials Into Blast Furnace, Aug 2 p 276

Bessemer Process:

Will It Drop*? July 5 p 8, (Editorial) p 96

Bethlehem Shipbuilding Corporation:

Buys Atlantic Works, July 12 p 93

Bethlehem Steel Co.:

Mass Production of Bolts and Nuts*, Oct 25 p 1015; Nov 8 p 1157

Opposes Rail and Water Freight Rates, Sept 27 p 793

Ore Unloader for Lackawanna Plant, Sept 13 p 647

Rolling 36-In. Wide Flange Beams, July 19 p 190

Stainless Clad Steel Castings*, Dec 6 p 1472

Bethlehem Steel Corporation:

Quarterly Report, Aug 2 p 324

Sues Steel Corporation on Grey Beam Patents, Dec 13 p 1540

Biggert, F. C., Jr.:

Alloyed Cast Iron Rolls, Nov 29 p 1349

Keeping Busy the Continuing Need, July 12 p 93

Roller Bearings in Four-High Mills, July 12 p 101

Billets:

Tracing Through Marks on Ingots, July 19 p 170

Billings & Spencer Co.:

To Be Reorganized, Oct 25 p 1039

Black & Decker Co.:

Buys Domestic Electric Co., Oct 18 p 992

Blacker Engineering Co.:

Blacksmith Hammer*, Aug 23 p 468

Blake, J. M.:

Wearing Tests of Various Steels, July 19 p 141

Blanchard Machine Co.:

Segment Wheel*, Sept 27 p 769

Blaw-Knox Co.:

Acquires Rights to Manufacture German Steel Lattice Roof*, Nov 1 p 1107

Denies Merger with Universal Pipe & Radiator Co., Oct 11 p 928

Steel Roof Sheathing*, Dec 20 p 1579

Bliss & Laughlin, Inc.:

To Make Cold-Finished Steel Bars, Aug 23 p 496

Bloomfield and Blum:

Chromium Platers Subject to Nose-bleed and Ulcers, Oct 11 p 888

Blow Gun:

Schutte & Koerting*, July 19 p 157

Blowpipes:

Air Reduction*, Aug 2 p 288; Oct 4 p 830

Effect on Steel, Nov 29 p 1358

Machine Cutting*, Nov 8 p 1171

Blueprint:

Order by Telephotograph*, Sept-13 p 630

Blum, Dr. William:

Mechanical Applications of Chromium Plating, Dec 13 p 1505

Boats, Flying:

Duralumin Construction*, Sept 27 p 766

Bodwell, H. L.:

Sheet Rolling, Nov 22 p 1302

Boilers:

For Burning Blast Furnace Gas or Pulverized Coal, Sept 20 p 688

High-Pressure Steam, July 12 p 80

Orders, June, p 256; July, p 612; August, p 872; September, p 1116

Bolt, Nut and Rivet Manufacturers:

Conference on Distribution Costs, July 5 p 16

Bolton, J. W.:

Gray Iron—An Engineering Material, Nov 1 p 1084

Bolts and Nuts:

Made from Billets*, Aug 30 p 517

Mass Production in Bethlehem Plant*, Oct 25 p 1015; Nov 8 p 1157

Book Reviews:

Abrasive Handbook, July 19 p 152

American Foreign Trade in 1928, Aug 16 p 401

American Iron and Steel Institute's 1927 Statistical Report, Aug 2 p 303

Automobile Steels, Cyclopaedic Account (Autostaehle des Welthandels), Dec 6 p 1436

Blue Book on Scrap Industry, Aug 16 p 401

Cartels in Germany and Elsewhere, Dec 6 p 1435

Directory of French Steel Manufacturers, Aug 23 p 465

Economies of Consumption, Dec 27 p 1639

Electric Heating, Aug 16 p 400

Employee Representation, Dec 6 p 1435

Foreign Trade Bibliography, Dec 27 p 1641

Handbook Encyclopedia of Engineering, Dec 27 p 1639

Handbook of Labor Statistics, July 19 p 153

Industrial Safety Organization for Executive and Engineers, Dec 27 p 1640

Management in the Factory, July 19 p 152

Manual of Industrial Safety, July 19 p 151

Metallurgical Handbooks, Dec 27 p 1640

Patent Essentials, July 19 p 152

Patent Office Practice, Dec 6 p 1435

Personal and Business Efficiency, Aug 16 p 401

Postponing Strikes—Study of Canadian Industrial Disputes Act, Aug 16 p 400

Relation of Education and Income, Dec 27 p 1641

Relation of Safety and Production, July 19 p 151

Standard and Tentatively Adopted Methods of Testing and Grading Foundry Sands, Dec 6 p 1436

Statistical Abstract of the United States, Nov 22 p 1318

Work of International Labor Organization, Dec 27 p 1641

Books Received, July 19 p 153; Aug 16 p 401; Dec 6 p 1436; Dec 27 p 1641

Bonuses:

For Department Heads, July 19 p 164

Borg-Warner Corporation:

To Merge with Galesburg Coulter-Disc Co., Dec 20 p 1603

Boring Machines:

Baker Brothers Hydraulic-Feed Horizontal*, Dec 6 p 1439

Giddings & Lewis Horizontal, Drilling, Milling and*, Nov 8 p 1169

Morton Locomotive Cylinder Planing and*, Nov 29 p 1369

Niles Two-Spindle Rod*, July 26 p 217

Ryerson Combination Drilling, Milling and*, Aug 2 p 288

Shaw Crane-Putnam Machine Co.*, Nov 22 p 1304

Boylston, H. M.:

Comment on Metallurgical Book Review, Oct 11 p 912

Bradford Machine Tool Co.:

"Lowdrive" All-Geared Lathes*, Dec 6 p 1437

Brass Companies Merge, Dec 6 p 1474; Dec 20 p 1586

Brauer, F. M.:

Aluminum Alloy Replaces Steel Castings on Field Gun Mounts*, Sept 6 p 574

Brazil:

Imports of Iron and Steel 1927, July 12 p 125

Itabira Iron Ore Co., Ltd., to Build Steel Plant, Nov 22 p 1312

Brewster, M. W.:

Automatic Welding Economies*, Aug 2 p 277

Brick:

Cause of Spalling in Oil-Fired Furnaces, Oct 11 p 913

Bridgeport Chain Co.:

Purchased by Round Interests, Aug 30 p 538

Bridgeport Safety Emery Wheel Co.:

Hydraulic Face Grinder*, Nov 29 p 1370

Bridges:

Alloy Steel 60 Years Old*, Sept 20 p 633, (Editorial) p 702

Detroit-Windsor Ambassador Near Completion, Dec 6 p 1444

Over Grand Canyon*, July 12 p 90

British Engineering Standards Association:

Drill Specifications, Aug 23 p 469

"Brittleness, Blue":

Nature of in Steel, Dec 27 p 1638

Broaching Machine:

Oilgear Improved Hydraulic*, Aug 9 p 349

Broderick Firesafe Homes Association:

Steel Frame Houses at Boston and Pittsburgh, Sept 13 p 648

Broken Hill Proprietary Co.:

To Build By-Product Coke Plant, Oct 18 p 1001

Bronzes:

Railroad Bearing, Wear Tests, July 19 p 142; Nov 8 p 1172

Brooks, Frank:

Sunday Operation of Blast Furnaces, Dec 6 p 1432

Brown, John, & Co.:

Forging Large Seamless Drums, Sept 27 p 760

Brown & Sharpe Mfg. Co.:

Height Gage Attachment for Squares*, Sept 13 p 639

High-Speed Milling Attachments*, Nov 29 p 1372

Micrometers for Measuring Forming Tools*, Oct 25 p 1034

Milling Machines, Nos. 1A Universal and 1B Plain*, Aug 30 p 522

Tubular Inside Micrometers and Micrometer Calipers*, July 12 p 92

Vertical Spindle Miller*, Sept 6 p 580

Brosius, Edgar E., Inc.:

Monrail Trolley Hoist with Bucket*, July 26 p 219

Brown-Fayro Co.:

Buys Mine Pump Line of Dravo-Doyle Co., Aug 23 p 474

Brown Instrument Co.:

Die Castings for Instrument Cases, Aug 2 p 281

Brown-Lipe Gear Co.:

Acquired by Unit Corporation of America, Dec 27 p 1674

Buckingham, Prof. Earle:

Automatic and Optical Measurements, Oct 25 p 1031

Buckingham Memorial Fountain:
Tinting Metal Fence, Sept 6 p 579

Buda Co.:
Diesel Generating Set*, July 12 p 91

Budd, Edward G., Mfg. Co.:
Mass Welding Operations*, Nov 8 p 1154
Single Stamping for Sedan Side*, Sept 13 p 623

Budgen, N. F.:
Performance Records of Stainless Steel, Aug 23 p 454

Budgets:
Control in Manufacturing*, Dec 20 p 1567
Stutz Motor Co., Plan*, Aug 9 p 333

Buffalo Bolt Co.:
Making Nuts and Bolts from Billets*, Aug 30 p 517

Buffalo Forge Co.:
50th Anniversary, Oct 18 p 965
Small Bending Roll*, Nov 8 p 1170

Building:
Contracts, June, p 94; July, p 406, 440, 502; August, p 729; September, p 942; October, p 1271, 1328; November, p 1518

Bullard Machine Tool Co.:
Mult-Au-Matic Center Lathe*, Sept 27 p 771

Bulle, G.:
Coke Oven Gas for Steel Plants, Dec 27 p 1638

Bullis, Harry A.:
Survey of Profit Trends*, Sept 20 p 687, (Editorial) p 703

Bundling Equipment:
Consolidated Steel Strapping for Sheets*, Dec 6 p 1441

Bunnell, Sterling H.:
Building Industrial Stock Values, July 19 p 143

Burden Iron Co.:
Acquires Right to Manufacture Hollow Rolled Bars, Dec 27 p 1678

Burden, W. W.:
Lake Transportation of Automobiles*, Sept 20 p 689

Bureau of Standards:
Consolidates Publications, Aug 9 p 376
Review of Metallurgical Division*, Aug 30 p 509, (Editorial) p 530

Business:
Big or Little? (Editorial), Dec 6 p 1450
Federal Trade Commission and (Editorial), Nov 29 p 1386
Forecaster for 1929*, Nov 8 p 1153
Forecaster, Short-Time*, Aug 23 p 465
New Forces in, Nov 29 p 1364
Quest for Stability (Editorial), Dec 6 p 1449
Research, Nov 22 p 1291
Self-Government in (Editorial), Aug 2 p 300
Self-Regulation, Nov 29 p 1373
Stock Market Loans and (Editorial), Aug 23 p 477
Survey by National Association of Manufacturers, Oct 25 p 1064; Nov 1 p 1112
Trends, Study Urged, Oct 25 p 1028
Using Statistics to Improve, Aug 30 p 519

Business Press:
Agent of Progress, Dec 20 p 1562

Butler Mfg. Co.:
Begins Aircraft Production, Nov 22 p 1335

Butterworth, A. C.:
Electric Power in Iron Mining, Sept 13 p 634

Butterworth, William:
Business Press an Agent of Progress, Dec 20 p 1562

Buying:
And Selling, Code Suggested, Oct 11 p 899
Changed in Steel (Editorial), Dec 27 p 1654
Hand to Mouth, Institute of Economics Studying, Oct 18 p 998
Instalment, and the Retailer (Editorial), Oct 11 p 911
Ruthless Uneconomic, Oct 11 p 892
What of the Cost of? July 5 p 11

Byers, A. M., Co.:
To Build Plant for Utilization of Aston Process, Nov 1 p 1115

Byrd Expedition:
Manufacturers' Contributions, Aug 16 p 412

C

Cable Clip:
Eureka with Grooved Jaws*, Sept 13 p 638

Cabinets, Steel:
For Oil Circuit Breakers*, July 26 p 215

Cadillac Motor Co.:
Conveyor System*, Oct 11 p 889

Cadmium Plating:
Automatic, in Ford Plant*, Aug 9 p 341

Caldwell Foundry & Machine Co.:
16-Ft. Vertical Casting*, Nov 29 p 1375

Calipers:
Brown & Sharpe Micrometer*, July 12 p 92

Cameron, C. L.:
Motor Application and Control on Lathes, Dec 13 p 1505

Canada:
And American Steel (Editorial), July 12 p 97
Automobile Production, June, p 257; July, p 731
Copper Production 1927, Dec 27 p 1648
Machinery Output 1927, Nov 15 p 1238
Pig Iron and Steel Production Ten Months, pp 1314, 1475; November, p 1582
Steel Tariff Agitation, Oct 4 p 843; Oct 11 p 900; Nov 8 p 1172

Capacity:
Blast Furnace 1927, Aug 9 p 344
Over, Some is Normal (Editorial), Aug 23 p 476
Rolling Mill by Districts, and Products*, Aug 2 p 272

Carboloy:
New Tungsten Carbide Tool Material, Nov 29 p 1380; Dec 13 p 1494

Carboloy Co., Inc.:
To Build Plant to Manufacture Metal and Carbide Alloys, Oct 25 p 1039

Carburization:
Due to Diffusion of Solid Carbon, Dec 27 p 1634

Car Dumper:

THE IRON AGE

New York, July 5, 1928

ESTABLISHED 1855

VOL. 122, No. 1

Output Increased by the Systematic Scheduling of Shop Work

BY CRIS BERG*

IT is frequently asserted that modern management and production methods used in large manufacturing plants cannot be adapted economically to shops which employ only a few hundred men. Argument is based on the increased overhead when as a matter of fact it is often possible that the increase in overhead need be only a fraction of the savings which accrue from a more efficient use of man and machine hours.

It is logical that the plant owner should first turn to means of making the best use of the capital which already has been expended, and to a greater flexibility of his working force. When these combinations have been improved to their practical limit then, if conditions warrant, he should turn to additional capital expenditure. It is obviously unfair to equipment builders to install time and labor saving devices under conditions in which they cannot perform, or even are not allowed to perform, work in the manner and in the quantity for which they were designed.

Frequently shop capacity is reduced because the foreman is swamped with a flood of details which prevent him from performing his duty as a true supervisor. Routing and scheduling work through the shop and giving detail work to clerks is often well worth its cost.

A striking example of the results brought about by planning is afforded by the present practice of a small shop in which contractors' equipment is manufactured. Production is for the most part of a standard line of equipment, but due to making of extra parts and of repair parts for obsolete models, a fair share of the shop capacity is engaged on what is not unlike jobbing work. This plant, which is valued at about \$800,000, comprises a machine shop, structural shop, an electric steel foundry and an erection or assembly department. About 175 people are employed.

*Consulting engineer, Chicago.

¶ Faced with the necessity of larger output and lower costs, a comparatively small manufacturer of contractors' equipment took under consideration a shop expansion program estimated at \$250,000.

¶ But by investigating the possibility of more effective use of equipment on hand and of labor time, a 50 per cent increase in productive capacity was obtained at an expenditure of approximately \$30,000.

¶ To the systematic routing and scheduling of work through the shop, described in detail by Mr. Berg, is attributed the marked increase in output with the minimum of additional investment.

The owner realized that costs were high and he was in urgent need of increased production. He first gave thought to expanding his shop and obtained an estimate of \$250,000 for the work. A new foundry was to cost \$150,000 and \$100,000 was provided for new equipment to increase the productive capacity of the shop by 50 per cent. In the final analysis a more effective use of the equipment at hand and labor time resulted in the 50 per cent increase in productive capacity and not more than \$30,000 was expended. Included in this figure was one item of \$15,000 for a new electric furnace.

The capacity of the plant was increased so that it was necessary to take on new lines in order to keep operating at capacity. A 10-in. turret lathe

and a three-spindle drill press only were installed to replace old equipment. Several machines were turned around to rearrange production groups, and a few machine drives were altered to obtain more suitable feeds and speeds, this often entailing not more than the change of a single pulley. No change was made from the use of hand trucks and wheelbarrows for transporting parts in the shop.

The old plan of scheduling work through the shop had grown up with the plant. As orders became more numerous it was necessary to get out more work, but the only effort put forth was that of brute force. Foremen were so entangled in a mass of details, such as hunting jobs for the men, hunting drawings, etc., that they had little time to properly supervise either the quality or quantity of output. They were almost entirely without records, depending upon memory, although it was not uncommon to have 30,000 pieces or more in the shop at one time.

By far the most important change made in the methods of this plant was brought about by systematic scheduling of orders and machines. This change permitted foremen to function in their proper capacity as supervisors and, by

providing checks on material in process and in the storehouse, eliminated much of the previous delay.

Shop Order Forms Prepared by Production Department

In the present practice of this plant all manufacturing orders originate in the manager's office. Standard bills of material and all drawings needed in the production of the various models of machines manufactured are furnished by the engineering department. Files of blueprints on standard machines are kept in each shop department, and it is the duty of the engineering department to keep these files complete and up-to-date. Blueprints for special jobs are attached to the manufacturing order by the engineering de-

The make-up of these cards and tags may be noted from Fig. 4.

The shop order sheet is then put through a duplicating machine and a number of copies, one of which is shown in Fig. 3, obtained. At the same time a complete set of the castings issue and other cards shown in Fig. 4 is hectographed from the original shop order sheet. The cards are then checked and clipped together, forming a package for each part or lot to be manufactured, so that as they are handled in the shop they will not accidentally become separated or disarranged. The card on top is always the one to be removed for the next shop operation. The writing of the one order form, Fig. 1, from which all other instruc-

Fig. 1.—The Combination Shop Order and Route Sheet (the upper form) Is Prepared in the Production Order Department. It is printed and filled in with hectograph ink and becomes the standard form from which all other instruction cards and forms are impressed

Fig. 3.—Hectograph Copies of the Shop Order Are Made As Shown in the Insert. The hectographing eliminates the possibility of errors in retyping

partment, the order, prints and bill of material then being sent to the production department. The latter department does all the paper work, including preparation of the shop order sheets, route tags, time cards and other forms used in connection with the various regular and special production orders.

Shop orders, in the form of the combination shop order and route sheet shown in Fig. 1, are prepared in the production department from standard bills of material, stock requisitions and sales orders. Department numbers, symbols and other routing information is then added by the route clerk from the master route card shown in Fig. 2. There is also indicated, at the extreme right-hand side of the shop order sheet, in the "number of forms required" columns, the casting issue cards, route tags, transfer slips, time cards and other forms required for the particular part on order.

tions are hectographed, eliminates the possibility of errors in copying.

Before leaving the production department, a copy of the shop order, with its package of cards, is sent to the rate setter, who writes the piece rates and other related information on the time cards. The shop order is then ready for scheduling.

Dispatch Racks Used in Shop Departments

Departmental control of order of work and other steps in the production processes is facilitated by a "material-not-in" file and a route board, or dispatch rack, in each shop department. When the shop is ready for additional work, the order sheet and package of cards are sent to the time-keeper of the department in which the parts covered by the order first go into production. Until work on the order is

actually started, the order and cards are kept in the department's "material-not-in" file. When the work is to be started, the time, stores issue, transfer slips and route tags are removed from the package and sent to the stockroom for the material. The material is then delivered by the stockroom to the machine or bench at which the first operation is to be performed, the exact place of delivery being indicated on the route tag, which remains with the material or part in process until the part reaches its final destination in the plant. Transfer slips are made out in duplicate so that both the sender and receiver have a receipt for the movement of the material. These slips also serve as notification to the timekeeper of the department that the material is on hand ready for the first operation.

Upon arrival of the material in his department the timekeeper removes the package of cards from his "material-not-in" file and places it in the third or back pocket of the route board or dispatch rack, which has a section of three pockets for each machine or bench in the department. When ready to begin operations on a part on order, the foreman takes the package of cards from the third or back pocket assigned to the particular machine, bench or man performing the first operation and places it in the next, or middle, pocket of the same section of the route board. The packages of cards in the middle pocket are arranged in the order in which they are to be used, thus constituting an order-of-work file for a given machine, bench or man.

Blueprints Issued with Operation Time Cards

When work on a given order is to be started, the timekeeper takes the front package of cards from the second pocket of the route board, removes the first operation time card and stamps it for "start." The remainder of the package of cards is then put in the first pocket of the board, which shows that this machine is working on the job covered by the card. The first pocket, it should be noted, contains only the time cards and transfer slips for the part being worked on by the machine or bench to which the pocket is assigned.

With the time card, the blueprint of the part to be machined is issued, the blueprint being returned to the timekeeper at the completion of the job, at the time of stamping "out" the time on that particular operation. The timekeeper then takes the front package of cards from the second pocket of the same section of the route board, removes the top time card and stamps the starting time on it; in this manner each machine in the department is kept supplied with work.

The first operation having been completed, the timekeeper advances the package of cards to the third or rear pocket of the section of the route board assigned to the machine which is to do the second operation on the piece. Thus as each operation on a given part is completed the remainder of the cards on the production order are moved to another section of the route board, according to the sequence of operations.

For special orders that go through the shop in a single or job lot number, route tags similar in form to that shown in Fig. 4 are issued by the production order department. These tags are printed in eight colors. A white tag signi-

fies that the material going through the shop is to replenish stock. Dark red tags indicate that the parts to which they are attached are on a rush or a special order. Various other colors are used to designate the parts of certain models of standard machines.

Costs Compiled in Main Office

Timekeeping, in so far as shop costs are concerned, is done in the shop office. The main office cost department figures and compiles each day the cost of all completed jobs. On the following day a sheet showing total time and money for each operation performed on the various jobs, is prepared and sent to the foreman, who has at his

desk a file of former costs on similar jobs. This affords him the opportunity of comparing present with past performances. At the same time the main office gets a copy of the report as to detail and total cost. Two days after a lot of machines has been completed the general manager has all the cost data before him.

Savings made by the adoption of systematic routing and scheduling, and by other changes noted above, are shown on the chart on page 3. In November, 1926, machine shop hours on the model "A" machine were 3640 and by September, 1927, they had dropped to 1950. In the same year structural shop hours had been cut from 2150 to 1625 and erecting shop hours had been reduced from 1950 to

The top curve shows the combined hours in the machine shop, structural shop and in the erecting department required on the model "A" machine. It is to be noted that total hours in September, 1926, were 7424, while in 1927 the figure had dropped to 4597. The dotted curve, marked model "B" machine, represents a total for departments previously listed and indicates that similar economies are being effected regardless of the type of machine that is on regular

2. Drawings are kept up to date and they are in the hands of workmen only as long as the various jobs are on the machines.

4. Machines are kept in good repair and they are operated at capacity. Foremen and the time study man train operators to work to the best advantage of all.

Working of System Requires Small Increase in Payroll

5. Continuous compilation of time and cost data is in effect.

To keep this system working there are required on the payroll five additional people whose salaries total about \$500 a month. They are a typist, a time study man, a cost girl, an extra timekeeper and a boy who operates the hectograph machine.

DISCUSSING how the growth of plants and questions of costs have put engineering in the purchase of mechanical supplies and equipment, Carleton Reynell, McClellan & Junkersfeld, New York, told of the position in industry of the purchasing engineer in a paper presented at the recent Kansas City convention of the National Association of Purchasing Agents.

"In short, he acts as the preliminary commercial research man always on the lookout for something new. He brings to the attention of the operating engineer only the ideas which would be ultimately economical, and while of

"That purchasing has long been a function of engineering is evidenced by some of the ideas borrowed from the engineering profession by purchasing and other commercial departments. All the curves picturing business conditions, and now used to illustrate nearly every phase of business, base their origin on the analytical geometry and graphic statics developed years ago for engineering use. The purchasing engineering departments of some of our largest companies have, as you know, gone far in the development of these curves, combining market prices, production costs, freight overhead, profit and all other factors which enter into the ultimate cost.

"To approach more nearly a perfect balance of ideas on mechanical purchases many large corporations have wisely decided that it is best to consider each purchase separately from two angles, the commercial and the technical, and then agree on a final decision, after which the commercial man with technical knowledge can best handle the business end of the problem."

MR. LINCOLN, the author of this article, is vice-president of the Lincoln Electric Co., Cleveland. He joined the Lincoln organization in 1907, upon leaving Ohio State University, and took over the management of the company in 1914. He has been active in the applications of electric welding for several years and is prominently identified with the industry.

SOME of the developments of the Lincoln company since Mr. Lincoln's connection with it are: Variable voltage welder; use of arc welding in place of cast and riveted parts, including buildings and bridges; development of the automatic carbon arc welder and of the "electronic tornado" automatic welder described in THE IRON AGE of June 28.

"We Expect a Minimum Cost Reduction of 10 Per Cent Per Year," says J. F. LINCOLN

WE are not sure that setting this standard at a definite figure is a good or a bad thing. Indications are that the tendency always is not to go beyond the mark set, in spite of the fact that it may be possible to do so, and therefore this 10 per cent may be acting as a limit rather than a goal.

Cost reduction has been so rapid in the past few years in nearly all lines that a reduction of 10 per cent now seems under, rather than over, the proper standard. I think it is safe to say that when value, wage rates, and cost of raw materials are taken into consideration, that the automobile industry has reduced its cost by more than 10 per cent per year for the last ten years.

Three Fundamental Principles In Cost Reduction

In getting this reduction we have adopted, at our plant, three fundamental principles which we believe are essential in accomplishing the result:

The first of these is accurate knowledge of costs.

The second is an attitude of mind which regards all processes and methods as only temporary makeshifts and holds that there is always a better method of doing any job if one only had the vision and ingenuity to find it.

The third essential is the adoption of one or more manufacturing development principles.

These three principles are actually applied as follows: No one at our plant can tell from the total cost of a finished product whether or not it is too high; all of us can tell fairly accurately whether or not a single operation is too high. The only way we know of appreciating these differences is by determining all costs to their last detail so that we are dealing with individual operations on individual parts. After this has been done it is comparatively simple to deal with each operation and with each individual piece of raw material and see whether a new method of doing that particular operation can be devised. Very few cost systems give this information in the detail, accuracy and

recency which is necessary to make the picture plain enough so that the management can, from the picture, see what the next step should be.

The accompanying chart shows the cost of a certain line of equipment over a period of years. The broken line is the normal cost referred to a standard rate of overhead; the red line is the actual cost including the actual rate of overhead. Data of this kind are interesting and are undoubtedly valuable as an indication of what the entire organization is doing, and from a curve of this kind the management can see whether progress is being made or not. But it is of no value whatever in pointing out what management should do in order to correct the situation and to reduce the cost. It is only the detail cost on each operation and on each piece that would be of any value in indicating the actual steps that should be taken.

Every Process or Method Is Temporary

The second fundamental principle is the definite belief that every process, every manufacturing method, is always a temporary makeshift. The only reason that a better method is not used is because the management and engineers have not the vision and ingenuity to see what that new method is. As long as that attitude of mind is maintained management is on the continual lookout for different methods, different machines for manufacture, and different designs which will better the product and reduce its cost. To illustrate how this point of view works out I will cite the following recent occurrence at our plant: The superintendent came to the chief engineer with a rotor spider, saying that he was sure the manufacturing method was wrong because the records showed we had been manufacturing this part in exactly the same way for five years. The fact that everyone else was making these spiders in the same way did not make any difference. Investigation of this particular part showed that by a change in design and construction a very much better spider could be made at

less than one-third of the previous cost and without many of the handicaps which the old part had.

It may perhaps seem a rather radical point of view to take that all processes and methods are wrong. A glance back at the history of manufacturing, however, would prove this conclusively. There is no doubt that history will prove that any process on an average is antiquated within five years. If it is going to be antiquated within five years, why wait the five years? If we only had the vision we could antique it immediately and not wait for development. The organization that can beat obsolescence and arrive at the new method before its competition does is the successful organization.

The locomotive of 1823 was thought at that time to be a marvel of efficiency, power and speed. Economically it is absolutely useless today, and was absolutely useless within a very short time after it was built. The same development is antiquating nearly every mechanical device. This is what we call progress. Since history shows that nearly every device which mankind has ever used has been discarded for a better and cheaper device within a short time, is there any reason why we should think that the

nished satisfactory equipment or even furnished at a previous time the best equipment obtainable, is, to say the least, dangerous.

It seems to me that the very foundation of intelligent buying must be the idea that conditions are continuously changing and that because of this it is essential that all types of any product be continually investigated and bought on the results of that investigation. Blind buying of nameplates and buying from friends are two of the most insidious wastes that industry now supports.

In general the raw material, supplies and machinery are from three to ten times the cost of labor in the cost of any product, hence the chance for saving in buying is very great if approached by the same "show me" attitude of mind that is adopted in judging manufacturing methods.

This is the gospel on which the manufacturing methods, designs, and points of view of our whole organization are based.

Modern Manufacturing Principles Must Be Adopted

The third fundamental principle which we have adopted is the application of modern manufacturing methods.

present methods, machinery, designs, construction, have any more worth than those which we have been discarding continuously throughout our lives? Is there any proof at all that we have arrived at the millennium, or are even approaching it?

The big manufacturing job, then, becomes the forecasting of development and doing it before anyone else. Any concern that can do this will be enormously successful; the concerns who are not successful are those who do not do it.

"Show Me" Attitude Needed In Buying

Very closely connected with this matter of forecasting manufacturing methods, is intelligent buying. The Shaw Publishing Co., Chicago, investigated the buying habits of a large number of representative manufacturing companies and found that in purchasing machinery at least half the companies bought after making inquiry only to one supplier of the type of machine wanted. It may be, of course, that a thorough investigation had been made beforehand, but from my own experience this is doubtful.

Since manufacturing methods and designs are scrapped at least once every five years, it is probable that no manufacturer remains in the lead in his product continuously. To buy without investigation of what the market affords from a concern because on a previous occasion it has fur-

In our own case one of these principles, which our company has originated and developed, consists in the substitution of welded steel for cast iron, and we have been able within the last 15 years to make almost a clean sweep of the iron casting used previously. Since steel is five times as strong, two and one-half times as stiff, and one-third as costly per pound as a casting, the marked advantage made possible by this substitution is self-evident. That we have in practically all cases been able to accomplish this purpose, making the saving in raw material of the purchased steel more than compensate for the additional labor and overhead cost of fabrication and welding, is evidenced by the fact that throughout the entire line where this substitution has been made we have been able to reduce our cost by more than 20 per cent of the previous cast iron cost. This is entirely aside from any cost reduction which has been made by more efficient manufacturing operations.

From this substitution other advantages flow. The first is that it eliminates patterns, pattern manufacture, pattern storage, and pattern repair; the second is that it greatly reduces inventories.

This steady decrease of costs and the consequent steady decrease of selling prices has been looked at askance by

(Concluded on page 62)

Will Bessemer Production Drop?

Not If Inherent Advantages of Process and Properties of Steel Are Exploited

BY G. B. WATERHOUSE*

THIS short discussion takes up acid Bessemer steel, because it is the only Bessemer process carried out on the American continent. The process is most spectacular, beautiful in the simplicity of its conception and capable of turning out large tonnages of steel. In tonnage, it is the second steel-making process in our country, coming next to the basic open-hearth.

The process of making ordinary Bessemer steel may be briefly described. It is carried out in a refractory-lined vessel or converter, ranging in capacity up to 30 tons. Such a vessel lies on its side to receive its charge of molten pig iron. In most steel plants the molten iron is used as it comes from the blast furnaces, being stored in mixers or mixer-ladles. In some foundries making steel castings in small converters, cold iron is melted in cupolas. The proper amount of iron is brought to the converter in a ladle and poured in. This operation of charging is shown in the photograph at the head of this page, taken at the Illinois Steel Co. The blast is then turned on and the vessel turned up, the air generally passing through a hollow trunnion to the blast box under the converter, through a large number of small tuyeres and then through the metal. The blow or heat lasts for from 12 to 20 min. The silicon and manganese of the pig iron are oxidized and pass into the slag, although some manganese is volatilized. Considerable iron is also oxidized, mostly entering the slag. Carbon burns, giving rise to the large carbon flame. Such a flame is strikingly shown in a photograph of a converter in blow taken in the Lackawanna plant of the Bethlehem Steel Co. and reproduced in the full page engraving. Toward the end of the blow the flame drops, showing that the carbon has almost all been removed, the vessel is again turned on its side and the blast shut off. This operation is also spectacular and is well shown in the view at the bottom of this page, also taken at the Illinois Steel Co. The vessel now holds "blown metal," which contains very low percentages of carbon, manganese and silicon, but all the phosphorus of the original iron and almost all the

sulphur. It also contains fairly large amounts of dissolved oxide of iron.

In order to be made into steel, certain final additions are needed to deoxidize the metal and give the composition required for the desired physical properties. These final additions vary; they may be added either in the converter or the ladle, or both, but the usual addition is ferromanganese added with the stream of metal while it is being poured from the converter into the ladle. (A pile of ferromanganese is shown on the platform near the converter being charged with molten pig iron.) The ladle is then usually

*Professor of metallurgy, Massachusetts Institute of Technology, and consulting engineer and metallurgist, Cambridge, Mass.

brought into position at the pouring platform, the metal is poured into ingots and the ingots of Bessemer steel are taken to the rolling mills for subsequent treatment.

A large tonnage of material is handled through the Bessemer converter and then transferred liquid to basic open-hearth furnaces for further refining. The product is usually called duplex steel and, in statistics, is included in the open-hearth total.

The statistical position of acid Bessemer steel production is shown by Table I, most of the figures of which are taken from the bulletins of the American Iron and Steel Institute.

Without going into an exhaustive analysis of these figures it may be pointed out that the Bessemer is a very important steel-making process, but, with a slowly declining trend, the percentage of the total tonnage has been decreasing until today it accounts for about 14 per cent of the total tonnage, or 19 per cent if the duplex steel is included. Duplex tonnage also appears to be slowly going down. This should really be placed in a different category, because it does not handle low-phosphorus pig iron nor make Bessemer steel, but treats higher phosphorus metal which is then sent to the basic open-hearth. The tonnage made of duplex steel depends closely upon economic conditions, principally the amount of scrap available for the open-hearth, its price and the tonnage requirements of the individual open-hearth plants.

Confining attention to straight Bessemer steel, it is a material that offers advantages over other steels for certain purposes. This is particularly true when it comes to free-machining and welding properties. For high-speed automatic screw stock Bessemer steel has never been surpassed. The very large tonnage of steel used for automatic screw machine products seems therefore preempted by this process. The demand for such material is increasing, the steel being either hot rolled or, more usually, cold rolled or drawn. A comparatively new development is the use of such material for case-hardened products, with splendid results. Its free-machining, together with its good welding properties, makes Bessemer steel valuable for butt-welded and lap-welded pipe, particularly the smaller sizes which are frequently cut, threaded and fitted in the field. A short, but rather general, questionnaire would indicate that Bessemer steel is holding its own in the field of skelp, particularly for making the smaller sizes of pipe. On the other hand, a demand for seamless steel pipe in certain sizes is causing the use of open-hearth steel; the specifications of many of the oil companies for open-hearth steel are also lessening the demand for Bessemer steel in tubular goods for the petroleum industry.

A large tonnage of Bessemer steel is being used for wire products, including wire nails, fencing, and the finer sizes of wire, and a great deal is rolled into sheet bars for

making sheets, tin bars and tin plate. Its inherent stiffness is often an advantage in wire or sheets, but for deep-drawing stock the dead soft open-hearth steel seems to be preferred. A considerable tonnage of Bessemer steel is still used in the form of bars, small structural shapes and for railroad purposes, such as spikes, bolts and nuts. The addition of copper in the usual amount of 0.20 to 0.30 per cent is fairly general for material exposed to atmospheric corrosion, such as certain wire products, sheets, railroad material and other special shapes.

In concluding this brief survey of the Bessemer steel situation it may be pointed out that the future promises that this method of steel manufacture will not only hold

Table I—Production and Percentage of Steel Ingots and Castings by Processes

its own but improve its position. The reserves of Bessemer ores are larger than was recently supposed. As a method of steel making it is capable of good control, and for many purposes, as indicated, the steel offers advantages.

While considerable research is being carried out in order to improve the quality and extend the usefulness of Bessemer steel, there is need for still more work along these lines. Some of the methods used in making high-quality steels by the open-hearth and electric furnace can be applied to the Bessemer process, particularly in obtaining sound steel ingots and steel more free from non-metallic impurities than is usual at present. It is believed that, if proper attention is paid to having the right kind of pig iron, if proper and in some cases improved Bessemer plant and equipment is provided, and if increased care is given to the finishing of the steel, to ladle practice and pouring practice, the Bessemer converter will produce metal superior to the ordinary run of tonnage steels made today and increased uses can be found for such qualities. This, as mentioned before, will enable this method not only to hold its own in the fields now occupied, but will increase the tonnage made and the steel used in other lines now closed to it.

What of the Cost of Buying?

Who knows today which costs the most—to shop among 50 vendors or to establish a close cooperative relationship with 12? asked Earl Whitehorne, commercial editor of the *Electrical World*, New York, at the recent Kansas City convention of the National Association of Purchasing Agents. “How much more does it cost to interview 50 salesmen than to give the same time to representatives of six selected suppliers who qualify completely in all the other factors of value?

“There are four things to be done:

“1. If the purchaser would demand firm bids, then general price cutting would soon cease. For a firm bid is like a signed order. It’s the word of the house. It puts industry on the one-price basis just as solidly as the modern department store. It means that a price made is the best and final price and the buyer is expected to place the business

by selecting the firm bid that offers the best value—not price alone but value.

“2. While this practice of firm bids is crystallizing into a custom, whenever bidders are called back by a purchasing agent and asked for a better price, let the bidder demand that the other bids be shown to him, so that he will know that he is not being lied to, and that his price is indeed high for equal value.

“3. And while the trickery of baiting bidders still continues in the world of business, let bidders hold post mortem comparisons of bids, by submitting their bids on closed business to their trade associations for comparison and report.

“4. And let the buyer frankly and publicly proclaim that he will thereafter shun the man who cuts his price, because the first price is supposed to represent the honest value of the goods, and the man who cuts stands self-convicted either by trickery or weakness.”

TREATING FORD MODEL "A" PARTS

Heat - Treatment Schedule for
Shafts, Axles and Gears—Con-
tinuous Gas and Electric Fur-
naces Handle Production

BY FAY LEONE FAUROTÉ*

SPEAKING generally, the Ford Motor Co. uses some ten different types of steel in the new Model A. These include chromium-vanadium steels, chromium steels with extra manganese, high manganese steels, nickel steels, Bessemer stock, carbon key stock, low-carbon basic open-hearth steels, special electrical alloys for starters and generators, and pure iron for pole pieces. Taking into consideration all grades and classes used for production and non-production jobs, the list may be extended to over 50 varieties.

It is Ford's practice to designate steels by colors painted on one end of the stock. If on the low side of an analysis the steel is also painted white, or if on the high side, white with a green stripe. Men in charge of inventory may thus see at a glance what stock is available and what its chemical composition is.

Furnaces Put Wherever Needed in Production Line

Since the physical characteristics of steel are largely determined by the succeeding working and heat treatments, it is not surprising to find heat-treatment furnaces and operations forming no inconsiderable part of the process lines. Indeed, it is in these departments that some of the most interesting automatic machinery, conveyors, electric and gas furnaces are found. In such a large production there is a need for handling a vast quantity at one time and maintaining a constant procession of parts so that in no minor assembly will there be a shortage. This has forced the installation in many of the bays of conveyor furnaces, some continuous, others intermittent, with mechanical methods of quenching, tumbling or cleaning.

Tempering or drawing is also often performed in furnaces automatically controlled and mechanically fed. Where annealing is necessary interesting forms of apparatus have been devised whereby this slow cooling may occur under conditions of travel or over baths which, while chilling one part of the piece, may allow the other to gradually drop in temperature, thus producing in a single part those variations of structure and physical characteristics best suited to its use.

A good example of this may be seen in Fig. 1, showing

the heat-treatment operations on the outer end of the rear axle housing. In the background is the discharge end of an electric furnace. Stock moves through by an automatic pusher which feeds in five parts at a time, one in each groove. Reaching the required temperature (which, incidentally, is controlled by an automatic recording device), the parts are removed one by one and placed in a quenching device which cools only the lower portion, the upper half remaining at the higher temperature. This quenching frame holds four parts and as fast as the workman in the center can remove them to the conveyor alongside, the workman in the background puts others in their place. The device is so timed that the forging remains in the quenching frame only long enough to harden the lower section, after which the upper is allowed to anneal in the air while the lower travels along the surface of the water to the end of the bath. Then complete immersion cools the entire piece to handling temperature, and it is removed by a third workman.

Double-Deck Furnace Saves Space

It is sometimes necessary to complete the entire heat-treatment cycle in a very small space in the process line. Thus the crankshaft is heated, quenched and drawn in a very limited area. Fig. 2 shows two electric furnaces, one above the other, economical in both heat and space. Adjoining them is a special quenching machine.

The crankshaft is made of hot-rolled steel of the following composition: carbon, 0.35 to 0.40; manganese, 0.70 to 0.90; silicon, 0.07 to 0.15; phosphorus, 0.03 maximum; sulphur, 0.05 per cent maximum. After forging, it is normalized at 1560 deg. Fahr., air cooled, and then machined. The parts are fed from the far end through the lower, or hardening, furnace shown in the view by an automatic pusher device. The workmen remove each crankshaft as it appears, heated to 1500 deg. Fahr., and place it between the jaws of a rotating quenching machine at the right, which immerses the part in caustic solution. After the proper quenching time has elapsed, the machine presents the part at the opening again ready for tempering. The workman then drops it into the projecting hooks of a chain conveyor

*Mechanical engineer, New York.

which carries it through the upper furnace. There it is drawn at 650 deg. Fahr. to meet a Brinell hardness of 402 to 444. The front end is then redrawn to meet a Brinell hardness of 302 to 364, and the flange is drawn higher still to give a hardness of 228.

A similar unique electric furnace and quenching device makes the heat treatment of the Ford Model A camshaft worthy of notice. The furnace is round like a turret and consists of a rotating hearth or table, upon which the camshafts are laid one at a time as the table revolves past the door. The speed of the hearth is so timed that when the revolution has been made the shaft is at heat. After each end is given a preliminary quench, the shaft is hung in a vertical position in a rotating quenching bath of caustic soda, which automatically completes this portion of the heat treatment without further attention.

Differential heat treatments—that is to say, methods whereby one portion of a part receives one treatment and another a second treatment so adjusted to produce correct properties for the required duties of the various portions—are fairly common. The Model A rear axle shaft, for instance, is made of a piece of hot-rolled steel of the same chemical composition as the crankshaft. It is heated to 1480 deg. Fahr., and withdrawn when it has reached a temperature of about 350 to 400 deg. Fahr. It is then placed in a combination gas-electric furnace having longitudinal baffles dividing the hearth into three heat zones. The gear end is thus held at about 300 deg. Fahr. to preserve full hardness for gear wear, the central portion is heated to 500 deg. to meet a Brinell hardness of 477 to 512 and the wheel end to 800 deg. Fahr., thus giving the latter portion a Brinell hardness of 302 to 340, suitable for cutting a key-way and threading.

Uniform Temperatures in Gas Furnaces

Gas furnaces are largely used at the Highland Park plant. A continuous annealing or normalizing furnace of typical design is detailed in Fig. 3. Fig. 4 shows such a unit, from the discharge end, placed in line with a tumbling barrel for cleaning scale from normalized gear blanks before cutting the teeth. (These rings for differential gears, by the way, were originally a flat bar, but have been curled edgewise and butt welded into a com-

plete circle.) As shown in Fig. 3, the incoming end of the furnace is heated by Surface Combustion burners with 1¼-in. nozzles, ranged three on a side, staggered or alternate spacings being 3 ft. 4 in. apart. The combustion zone is separated from the work by a false arch, perforated with about 170 holes, 2 in. in diameter. After playing upon work sliding through on the rails, the hot gases go down into the checkerwork below the hearth, and are withdrawn through a central slot into a series of 13 vertical flues 4½ in. square, built in the side walls and connecting with a breeching built above the furnace, or into longitudinal flues below the floor level. Passing through this heated portion of the hearth, the work enters an unheated extension, with a descending roof. The hearth of this latter portion is built on three arches, principally to economize on brick work, and to provide ventilation through doors in the steel buildings up through wide slots at each side of the hearth.

Such a furnace has a hearth area of 43 sq. ft., can heat approximately 2500 lb. of steel per hour to 1550 deg. Fahr., and consumes 4530 cu. ft. of 530-B.t.u. gas per hour. The total flue area is 490 sq. ft.

At Fordson there is a growing tendency to use electricity for heating and heat-treatment operations. Many of the new installations use a ribbon heating element. Results are justified by the more accurate control of heat, general cleanliness, quietness of operation and simplicity of control. There is little outside radiation, so the workman can stand close to the mouth of the furnace without discomfort.

The ability of various parts to stand up under road con-

Fig. 1.—Machine for Quenching Flange Only of Rear Axle Housing Forging (Above)

Fig. 2.—Hot Crankshafts Emerge from Lower Furnace, Are Quenched in Special Device at Left, and Are Drawn in Upper Deck

ditions depends very largely upon the heat treatment. Ford parts are light but unusually strong. Therefore a few exact heat-treatment specifications will be of interest to production and metal-working executives.

Many parts, among them the following, are made of a medium-hard carbon steel with the following chemical composition: carbon, 0.35 to 0.40; manganese, 0.70 to 0.90; silicon, 0.07 to 0.15; phosphorus, less than 0.03; sulphur, less than 0.05 per cent.

The differential gear case is heated to 1470 deg. Fahr., quenched in water, and drawn at 1000 deg. Fahr. to a Brinell hardness 228 to 286.

The valve push rod is made of 0.6-in. cold heading wire, upset, counterbored and finished all over. Heat treatment: Heated to 1470 deg. Fahr., quenched in water, removed from quench at 350 to 400 deg. Fahr. to meet specification of Rockwell hardness C-50 to C-58.

The starter drive pinion is made of 1.44-in. cold-drawn steel, selected. Its surface is practically covered with gear and ratchet teeth, and the reamed counterbore must be maintained smooth and straight for 1½-in. length between the limits of 0.788 and 0.792 in. Heat treatment: 1470 deg. Fahr. in cyanide 10 min., quenched in oil. Surface must be file-hard.

The front brake operating wedge is made of hot-rolled steel. Heat treatment: Heated to 1470 deg. Fahr., quenched

in water, annealed at 450 deg. Fahr. to Rockwell hardness C-48 to 52.

The rear spring perch is an intricate forging made of hot-rolled steel. Heat treatment: Normalized after forging to meet a Brinell hardness of 143 to 196, then machined. A ball-shaped projection only is heated in cyanide at 1500 deg. Fahr. for 2 min. and quenched in water to file hardness.

The clutch disk is forged from 2 3/16-in. hot-rolled rounds. The drum is 3.66 in. in inside diameter, 2 9/32 in. long, and has gear teeth cut on its outer surface. Splines in the hub bore are broached, and the whole piece is held to within two or three-thousandths for eccentricity and flatness. Heat treatment after forging: Heated to 1470 deg. Fahr., quenched in water and drawn to 1000 deg. Fahr. to produce Brinell hardness of 255 to 302. After machining all over, it is heated to 1350 deg. Fahr. in cyanide and quenched in oil for a file-hard surface.

Treatment of 1 Per Cent Chromium Steel

A number of important transmission parts are cut or forged from a low-chromium steel of the following chemical composition: carbon, 0.35 to 0.38; manganese, 0.65 to 0.80; chromium, 0.90 to 1.10; silicon, 0.10 to 0.20; phosphorus, 0.03 maximum; sulphur, 0.04 per cent maximum.

The transmission main shaft is first annealed at 1650 deg. Fahr., held 1 hr., cooled in furnace to 1150 deg. Fahr.

Fig. 3.—Construction Details of Typical Gas-Fired Annealing or Normalizing Furnace

Fig. 4—Normalizing Furnace and Tumbling Barrel for Handling Welded Blanks for Differential Ring Gears

and finally cooled in air to produce a Brinell hardness of 187 to 217. It is then machined. Final heat treatment is: Heated to 1500 deg. Fahr. in cyanide, quenched in oil, drawn in oil at 400 deg. Fahr. 1 hr. to a Brinell hardness of 477 to 532 or a Rockwell C scale-hardness of 48 to 53.

The various transmission gears are taken from the low side of this chemical specification, and previous to machining they are annealed as above to a Brinell hardness of 170 to 196. After machining, they are heated to 1500 deg. Fahr. in cyanide, quenched in oil, and drawn in oil at 400 deg. Fahr. for 1 hr. to a Brinell hardness of 477 to 532 (Rockwell hardness of C-48 to 53).

Rear axle driving gears are held in cyanide somewhat longer and, after quenching and drawing, must be file-hard.

The differential driving gear is a steel forging. After forging, it is brought to 1650 deg. Fahr., taking 1 hr. to reach heat, and is soaked 15 min. and cooled slowly to a Brinell hardness of 170 to 207. Then, after machining, it is heated in cyanide at 1500 deg. Fahr., soaked 7 min., quenched in oil at 400 deg. Fahr. and left in oil 1 hr. Hardness specification: file-hard—Rockwell C-50 to 55.

Spindle arms and connecting rods are of lower carbon and chromium (carbon, 0.26 to 0.30 per cent; chromium, 0.80 to 1 per cent). The spindle arm is normalized at 1650 deg. Fahr. before machining, and then is given this heat treatment: Heated to 1500 deg. Fahr., quenched in caustic solution, removed from solution at 400 to 600 deg. Fahr., and drawn at 980 deg. Fahr. to a Brinell hardness of 286 to 321.

Piston pins are of still milder steel. The chemical composition is carbon, 0.10 to 0.15; manganese, 0.25 to 0.40; chromium, 0.25 to 0.35; silicon, 0.10 to 0.20; phosphorus, 0.03 per cent maximum; sulphur, 0.04 per cent maximum. Heat treatment is as follows: Carbonized at 1700 to 1750 deg. Fahr. (0.025 to 0.035 in. from finish size), normalized at 1650 deg. Fahr., cooled slowly, cleaned if necessary, taper-reamed, reheated at 1600 deg. Fahr., quenched in caustic soda solution to a hardness of C-58 minimum.

Case-Hardened Chromium-Vanadium Steel

Cyanide hardening of a chromium-vanadium steel makes a durable spindle bolt. It is forged from the following

steel: carbon, 0.17 to 0.22; manganese, 0.60 to 0.75; chromium, 0.65 to 0.80; vanadium, 0.12 to 0.15; silicon, 0.10 to 0.20; phosphorus, 0.03 per cent maximum; sulphur, 0.04 per cent maximum. After cleaning, machining and grinding, it is heated in cyanide to 1650 deg. Fahr. for 15 min., quenched in oil, to test file hard and have a cyanide case with a 0.007-in. minimum thickness.

The driving pinion is forged of the same steel and then annealed at 1650 deg. Fahr. to a Brinell hardness of 163 to 207. It is machined all over and copper plated. The gear teeth are then cut, and one boss (which must also be hard) is turned down slightly. A carbonized surface of 1/32 to 3/64 in. deep is given by carbonizing at 1750 deg. Fahr. for 6 hr. Pinions are cooled in the boxes, removed, heated to 1650 deg. Fahr. 10 min. in cyanide and quenched in oil. After drawing at 400 deg. Fahr. in oil, the hardened face of the gear must have a Rockwell hardness of C-58 to 65.

Stretching of Hot Steel Studied

The high temperatures and pressures associated with developments in power plant equipment, oil cracking processes, and the chemical industries generally, have shown the need for added information on the behavior of metals at high temperatures. This applies to a variety of properties but in particular to the elongation with time, or so-called creep of metals, when subjected to fixed loads for long periods.

In Technologic Paper No. 362 just issued by the United States Bureau of Standards are given the results of so-called "creep tests" in which the elongation of metal specimens was observed when subjected to fixed loads for long periods extending in some cases for more than a year.

Tests were made on a low-carbon structural steel, a high-chromium "stain-resisting" steel, a chromium-molybdenum structural steel, high-speed tool steel, and one of the high-chromium high-nickel "heat and corrosion resisting" steels at temperatures between 70 and 1350 deg. Fahr. So-called "creep charts" are given, so that the allowable stresses, if the steel is to last for some approximate length of time and with a certain amount of deformation, may be determined.

Unite to Cut Distribution Costs

Manufacturers and Jobbers Plan Cooperative

Program at New York Conference—

Committees Appointed

TO develop a plan for distributing steel and heavy hardware products that will bring a fair profit to both manufacturers and jobbers, a conference of producers and distributors was held at the Waldorf-Astoria, New York, May 28 and 29, under the auspices of the bolt, nut and rivet industry. There was an attendance of 300 manufacturers and jobbers from all parts of the United States.

A sequel of the conference will be another general meeting of manufacturers and distributors in Washington to work out plans for cooperation in greater detail. Committees named in the New York conference will convene in Washington within two months to organize permanently and to ask the Federal Trade Commission to approve their program.

Producing Costs Declining, Distributing Costs Rising

“ALMOST all lines of industry, in their study of cost reduction, have confined their effort to lower manufacturing costs,” said Charles J. Graham, president of the Bolt, Nut and Rivet Manufacturers Association, in an address opening the conference. “Millions have been spent in this, until today we have come close to perfection on this side of the picture. But the millions that have been saved by this method have been more than squandered by unsound selling policies, so our executives must now turn to the selling and distributing side, to stop the waste and to secure as great efficiency from this angle of their business as they are from the manufacturing side.

“The manufacturing industries of this country are not equipped to do a retail business. They do not need such equipment, for they already have set up for them in every important community in the country warehouse facilities for the proper distribution of their merchandise.

“Every jobber has his corps of salesmen who are fitted for the solicitation of general business. Their overhead expense is distributed over thousands of items, whereas the manufacturers’ must be borne by one, or in any event, by a very few.

“If all of the manufacturing industries of the country, particularly in the heavier lines, would analyze their selling costs, they would find that about 80 per cent of their sales expense is producing less than 20 per cent of their volume, and this 20 per cent of the volume, were it charged with its proper portion of sales expense, plus the fact that it is also the highest cost from an operating standpoint, would be shown to be largely responsible for the total lack of profit, and in many cases entirely responsible for the losses incurred. The losses of this 20 per cent must, in the operation of their business, be absorbed out of the profits of the 80 per cent low cost volume.

“The best example I can show of the truth of this statement was published in the *New York Times* on June 17, showing where a study has been made by one of our Government departments of the sales of a very large unnamed company. An analysis was made of nearly 800,000 orders, which was 60 per cent of the total number of orders received. It was found that these orders represented only about 10 per cent of the total volume, and averaged less than \$10 each. The significant part is that they showed an average loss of \$1.60 per order, or about 16 per cent.

“We have at this conference not only the distributors, but representatives from almost 50 manufacturing lines. The distributors are ready and willing to perform a service

for which they are adequately equipped. Their committees are organized and functioning in cooperation with the bolt, nut and rivet industry, and are in position to take on any additional duties that any of the other manufacturing lines might inflict upon them.”

What Has Been Done in Bolts and Nuts

Mr. Graham briefly outlined the demoralized condition of the bolt, nut and rivet industry in 1924, when losses totaling \$12,000,000 were incurred on a gross business of \$75,000,000, and the subsequent improvement after organized efforts were made to solve the distribution problem.

“We organized our present association in April, 1925, and an executive committee was appointed, which made a complete study of the causes which had brought us into the demoralized condition in which we had found ourselves in 1924,” said Mr. Graham. “The first study made was on cost accounting, and after a year of intensive work on the part of a special committee, headed by the assistant controller and chief cost accountant in the bolt and nut department of one of our leading companies, a cost system was devised, and made available to every plant in the industry.

Consumers Persuaded to Stop Making Bolts

“We found that many railroads and large industrials were manufacturing bolts and nuts, having been forced into it when they were unable to secure material during the war period, and also in the 1920 boom. We organized a department, with an ex-railroad man at its head, to go to these various companies with the idea of showing them they could purchase their material cheaper than they could manufacture it, and we have been successful in persuading many large roads to cease the manufacture of this product.

“In the industrial field, several large railroad car builders are now our customers, rather than our competitors. We hope eventually by this method to get back into our industry somewhere between 100,000 and 200,000 tons of product yearly, which will increase our operations and decrease our costs.

Scientific Base List of Prices Prepared

“Working in conjunction with the division of simplified practice of the Department of Commerce, we standardized our methods of packing, reducing the number of package sizes from 168 to 18. Each manufacturer now puts up his

product in standard containers, so that regardless of from whom a customer purchases, he gets the same quantity of bolts and nuts per case or keg. Another committee, working with a committee appointed by act of Congress, has been active in promoting the standardization of our product in sizes and styles. We have already reached the point where head sizes, nut sizes and thread fits are standard. However, we have only scratched the surface on this part of our program. Our basic list, from which discounts apply, was prepared as the result of a scientific study by a committee consisting of a number of the operating heads of various companies, the sales departments having nothing to do with it, so that today we have a completely scientific basic list, based on actual manufacturing costs. By using this list, every company with modern equipment should be able to make a fair return on each unit of equipment operated. The list was compiled on a machine-hour rate basis, so that the operation of a 1/4-in. machine will return the same proportionate profit as the operation of a 2-in. machine, the cost of equipment, floor space occupied, cost of tools and dies, cost of maintenance and percentage of overhead all being taken into consideration.

Advantages Gained by Cooperating with Jobbers

"Our market during the progress of this work had become more stable, proving to a degree the idea we had at the start that if we would carry on what we termed a constructive campaign, our selling prices would readjust themselves and eventually the price situation would more or less take care of itself. However, we found the greatest antagonism to our fairly well stabilized market came from the distributors.

"Our investigation as to the causes of the distributors' attitude showed that we were entirely responsible for it. In our struggle to secure enough orders to run our plants to capacity, we had practically lost sight of the distributor. We had become his most aggressive competitor and were soliciting trade which, by virtue of his facilities and location, he could handle in a much more satisfactory and economical way than we could, and we were not only disrupting his trade, but our own as well.

"In consultation with a Pittsburgh jobber we suggested he appoint a committee of distributors and we would appoint a committee of the local manufacturers to discuss a possible method of bettering the condition. To

determine who the large buyers of our product in that territory were, we requested the jobbers to furnish a list of all of their customers in all lines. The list contained 29,000 names. Our committee studied this list and found there were 11,000 bolt and nut buyers in the district, taking in a territory within a radius of 200 miles of Pittsburgh. Our committee studied this list of 11,000 accounts and finally selected 275 names on the list on which we made the start of our experiment.

Do Not Solicit Small-Lot Business

"The basis of our arrangement with the distributor is this: We say to him that, owing to the fact that the soliciting and handling of what might be termed the smaller run of orders is too expensive for us, we as manufacturers will only solicit business from the 275 accounts in this territory and will do everything in our power to have the balance of the trade flow through its proper channel—in other words, through the distributor. While we will not solicit trade, other than from the companies listed, we cannot legally and do not refuse to sell to the trade not appearing on this list. However, should we receive inquiries or orders from such trade, we will sell or quote them whatever prices we see fit. But we give the jobber the assurance that, on such inquiries or orders, we will each determine for ourselves as to what the average jobber's resale price out of warehouse stocks is in the territory, and will have regard for that situation.

Jobbers' Committees Organized

"The plan worked so satisfactorily to both parties in the Pittsburgh district that we determined to make it nation-wide, and carried it to every important distribution center in the United States. Our plan of operation, other than in Pittsburgh, was to secure a list of distributors in a given territory, send out an invitation for a conference, and then with a selected committee of the leading executives of a number of companies, visit this territory, explain our plan and request the jobbers to appoint a chairman, who in turn was to appoint a committee of distributors representing the territory of which this particular city was the center. We then appointed a committee of manufacturers, who subsequently met with the jobbers' committee to determine who the large buyers were in that particular territory, and to follow the same pro-

Seventeen Industries Represented on Manufacturers' Committee

AT the distribution conference a committee representing manufacturers was established. A joint meeting of this committee and the jobbers' representatives arranged for each manufacturer to call a conference of the leaders of his industry to consider a distribution plan which would best fit the needs of that industry. At these conferences delegates will be chosen to represent the different industries at a trade conference to be held in Washington later in the year, which conference will include both jobbers' and manufacturers' representatives. The committee of manufacturers follows:

Bolt, Nut and Rivet Manufacturers
CHARLES J. GRAHAM, Graham Bolt & Nut Co., Pittsburgh.

Wire Fence Industry
WILLIAM G. HUME, vice-president and general sales manager Keystone Steel & Wire Co., Peoria, Ill.

Wire and Nail Manufacturers
GEORGE W. JONES, general sales manager Pittsburgh Steel Co., Pittsburgh.

Wire Cloth Makers
GEORGE E. WATSON, vice-president in charge of sales Wickwire-Spencer Steel Co., Inc., New York.

Wheelbarrows
H. E. HAYMAN, General Wheelbarrow Co., Cleveland.

Valve and Packing Industry
JAMES R. WHITE, secretary Jenkins Brothers, New York.

Cap and Set Screw Industry
H. E. PENFIELD, Chicago Screw Co., Chicago.

Cordage Industry
J. S. McDANIEL, secretary Cordage Institute, New York.

Abrasive Industry
WILLIAM MCGREGOR, Carborundum Co., Niagara Falls, N. Y.

Welded Chain Manufacturers
FRANK A. BOND, vice-president United States Chain & Forging Co., Pittsburgh.

Makers of Fire Fighting Equipment
CHARLES H. MEIGS, commissioner Fire Equipment Manufacturers' Institute, New York.

Cold Finished Steel Bar Industry
EDWARD L. PARKER, president Columbia Steel & Shafting Co. and Edgar T. Ward's Sons Co., Pittsburgh.

Shovel Manufacturers
C. L. BUTTS, manager of sales Wood Shovel & Tool Co., Piqua, Ohio.

Horseshoe and Calk Manufacturers
ROSS R. HARRISON, general manager Bryden Neverslip Co., New Brunswick, N. J.

Electrical Goods Industry
W. E. SPRACKLING, president Tubular Woven Fabric Co., Pawtucket, R. I.

Hack Saw Makers
WILLIAM E. CROSS, Clemson Brothers, Middletown, N. Y.

Hand Tool Industry
F. R. PLUMB, president F. R. Plumb, Inc., Philadelphia.
S. HORACE DISSTON, Henry Disston & Sons, Inc., Philadelphia.

cedure after the list was created that we followed in Pittsburgh. We now have 34 such committees organized and in operation.

"The bolt, nut and rivet industry is now actively soliciting only 2690 accounts in the entire country, including the distributors, and every bolt and nut manufacturer in the United States has a copy of this list, whether he is a member of our association or not. Naturally our competition is much more active on the desirable business than ever before. We do not have any price agreements. We meet almost every two weeks. We have worked under advice of counsel ever since our organization started, and prices are never discussed, even on past transactions. We do not dictate or even suggest resale prices to the distributors, that being entirely within their province. The result has been that the distributors' attitude has changed from one of antagonism to one of a willingness to support a stable market. They are willing and anxious to pay a stable market price, realizing fully that a stable market for them is just as important as it is for the manufacturer.

"The benefit to the manufacturer extends beyond the removal of pressure from the distributor for lower prices. The plan has developed into an important factor in cost reduction and has brought about a reduction in that portion of our expense which had been mounting higher and higher every year. Our machines are able to operate to better advantage on quantity production. Our packing expense has been greatly reduced, as the bulk of our material, at least 95 per cent of it, goes out in standard container quantities. Shipping expenses are greatly reduced, as orders now come in heavy tonnages rather than in large number with little tonnage per order. It reduces clerical help, accounting expense, stenographic expense; in fact, every item that goes into overhead."

Schwab Indorses Plan

CONSIDERABLE impetus was given the movement toward better distribution by Charles M. Schwab, chairman Bethlehem Steel Corporation, New York, who, as president of the American Iron and Steel Institute, brought

to the conference the hearty support and indorsement of the iron and steel industry. "It will have the backing of everybody in the American Iron and Steel Institute," said Mr. Schwab, "as far as we are able to persuade them to carry it out, and I believe we will be. I hope the association that you have here outlined will reach such a development of perfection that we may use it as a model and adopt it for the whole iron and steel industry, because I believe in it and it is right."

Criticizing the weakness of the industry in the distribution of its products, Mr. Schwab said: "The whole talent has been devoted to seeing what we can do to reduce cost. Why didn't we give and why don't we give equal talent, equal energy and cooperation to devise a method of economically distributing our product? If the executives of the steel industry can't devise better ways of legally distributing their product, I am in favor of giving some of the men in the ranks a chance to see what they can do. Let those who built up the works see what they can do in the distribution of products. You know the distribution question is a difficult one. If it weren't, the best talent in the country would not be sought after to do it. The engineer and the works manager have done their jobs in the last 25 or 30 years. But those at the head, the executives in the selling and distribution departments, have their jobs ahead of them."

Opposes Preferential Prices

Discussing prices, Mr. Schwab stated that he was not in sympathy with the plan by which preferential customers by reason of their volume of business are regarded as entitled to better prices. "It is the little fellow," he continued, "that is entitled to better prices if anyone is, because the large buyer has chances which the small one has not. Let us have the same price for your product for everybody. I find that the great majority of our customers are happiest if they know they are paying the same prices as any competitors for steel. They don't want a better price and don't care whether it is \$2 or \$5 a ton. They

(Concluded on page 62)

Chairmen of Jobbers' Committees Cooperating in National Distribution Conference

From those listed below the Messrs. Welton, Hansen, Sargent, Smith, Riddle, Puchta, French, Peden, Helm, Waterman, Morris and H. L. Gray, Simmons Hardware Co., St. Louis, and H. W. Caldwell, Hibbard, Spencer & Bartlett, Chicago, were named as a committee to meet with the committee of manufacturers' chairmen to confer on distribution problems

1. BOSTON, R. H. Welton, Chase, Parker & Co., Boston.
2. NEW YORK, W. E. Hansen, Hansen & Yorke, New York.
3. SYRACUSE, N. Y., A. B. Paull, Beals, McCarthy & Rodgers, Buffalo.
4. ALLENTOWN, PA., W. E. Bittenbender, Bittenbender Co., Scranton, Pa.
5. PHILADELPHIA, Fitzwilliam Sargent, Standard Supply & Equipment Co., Philadelphia.
6. BALTIMORE, Louis Moller, Anderson & Ireland, Baltimore.
7. RICHMOND, VA., Alvin M. Smith, Smith-Courtney Co., Richmond.
8. CHARLOTTE, N. C., Charles Nuchols, American Hardware & Equipment Co., Charlotte.
9. ATLANTA, George Winship, Fulton Supply Co., Atlanta.
10. JACKSONVILLE, FLA., L. J. Larzelere, Farquhar Machinery Co., Jacksonville.
11. PITTSBURGH, W. L. Rodgers, Pittsburgh Gage & Supply Co., Pittsburgh.
12. CLEVELAND, H. H. Riddle, George Worthington Co., Cleveland.
13. DETROIT, W. H. Basse, Joseph T. Ryerson & Son, Inc., Detroit.
14. INDIANAPOLIS, F. T. Holliday, W. J. Holliday & Co., Indianapolis.
15. CINCINNATI, George Puchta, Queen City Supply Co., Cincinnati.
16. NASHVILLE, TENN., Brown Buford, Buford Brothers, Nashville.
17. BIRMINGHAM, W. W. French, Moore-Handley Hardware Co., Birmingham.
18. MEMPHIS, TENN., James Pidgeon, Pidgeon-Thomas Iron Co., Memphis.
19. ST. LOUIS, George K. Conant, Sligo Iron Store, St. Louis.
20. CHICAGO, A. M. Mueller, Joseph T. Ryerson & Son, Inc., Chicago.
21. MILWAUKEE, I. R. Shadbolt, Shadbolt & Boyd Iron Co., Milwaukee.
22. ST. PAUL, MINNEAPOLIS and DULUTH, William J. Dean, Nicols, Dean & Gregg, St. Paul.
23. DES MOINES, IOWA, W. E. Muir, Luthe Hardware Co., Des Moines.
24. KANSAS CITY, Edward O. Faeth, Stowe Supply Co., Kansas City.
25. TULSA, OKLA., S. E. Clarkson, Oklahoma City Hardware Co., Oklahoma City, Okla.
26. DALLAS, TEX., Alfred Weaver, Briggs-Weaver Machine Co., Dallas.
27. HOUSTON, TEX., D. D. Peden, Peden Iron & Steel Co., Houston.
28. NEW ORLEANS, J. B. Simmons, Woodward-Wight Co., New Orleans.
29. PHOENIX, ARIZ., P. R. Helm, Pratt-Gilbert Hardware Co., Phoenix.
30. DENVER, H. V. Waterman, Hendrie & Bolthoff Machine & Supply Co., Denver.
31. SALT LAKE CITY, H. P. Lambrecht, Salt Lake Hardware Co., Salt Lake City.
32. SEATTLE, George W. Boole, A. M. Castle Co., Seattle.
33. SAN FRANCISCO, Henry Morris, 218 Chronicle Building, San Francisco.
34. LOS ANGELES, J. E. Webster, Ducommun Corporation, Los Angeles.

Flexibility in Making Automobile Frames

**Cleveland Plant
Can Quickly
Change from
One Run of
Frames to
Another**

**Has Progressive
Assembly with
Monorail and
Automatic
Conveyors**

THE Midland Steel Products Co. has just finished the complete rearrangement of the automobile frame department of its Cleveland plant. New semi-automatic assembly lines, with conveying equipment for handling work on monorail tracks, and a new automatic unit for cleaning, painting and baking, with automatic conveyors for delivering the finished frames to the car loading platforms, have resulted in marked improvement in the quality of product, it is said, as well as reductions in production costs and a saving of one-third of the floor space previously required.

Special consideration was given to the flexibility required by the ever changing conditions in the automotive industry, and equipment has been installed and lines arranged so that, though called upon today to turn out one automobile manufacturer's frame by the thousands, they may, with equal efficiency, turn out another manufacturer's frame by the hundreds tomorrow, the delay in adjustment being only a matter of a couple of hours.

The general plan used in the progressive assembly lines of the automobile plants has been followed. Everything has been laid out to eliminate useless handling and to make for continuous, progressive operations. Parts are kept moving through successive operations until they reach the point in the assembly line where they are needed to be brought together to form a finished frame. The old method of grouping presses and other equipment according to their types and sizes, with the accompanying handling back and forth, has been eliminated. Equipment is now grouped for a progressive movement of the parts as required by their design, all operations being in sequence and with all handling and movements reduced to the minimum.

Work May Be Shifted from One Frame Line to Another

At the present time the Cleveland plant has three frame lines, two devoted to the manufacturing of a completely assembled frame and the third for the making of complete sets of frame parts, which are shipped unassembled to automotive manufacturers. Each unit is sufficiently flexible to permit the shifting of the jobs from one to another with little expense and delay, thereby insuring a rapid inventory

turnover of automobile frames and eliminating large storage banks with their accompanying handling expense.

Great attention has been paid to a quick turnover of inventory. Steel is generally delivered directly from the freight cars to the pickling department and is on its way through into a finished frame, without delays or many handlings in the plant. The materials used are plates, sheets or hot-rolled strip—whichever is the most economical with a given design.

In pickling, all steel is handled in and out of the tanks in acid-resisting crates holding approximately 7 tons each. The crates are so arranged that each sheet is properly separated to insure complete action of the acid on the entire surface of the steel. After the acid immersion, the steel is rinsed in tanks of water and soda ash. In the final operation, before the steel is removed from the pickle crates, it is dipped in a tank of soluble oil. As the sheets are well separated for pickling, they receive a good coat of oil on both sides, eliminating the labor of lubrication with drawing compounds except in cases of difficult draws. From the pickle house the steel is delivered to the blanking presses in one of the frame lines.

Minimum of Manual Handling in Progressive Assembly

Each of the three lines is equipped with two mechanical presses for making side rails. In the first press, side rails are blanked and pierced in pairs in one operation, all holes being put in that will not distort during the forming operation. An automatic conveyor in the center of the press carries the blanks to the forming press, where they are formed in pairs. A conveyor from this press carries the rails to racks at the head of the side-rail assembly units. There are two side-rail assembly units on each line, one for right and the other for left hand members.

The side rail is set on a cradle suspended from a carrier that moves on a monorail track approximately 250 ft. long. The cradle is spring-suspended, making it flexible for handling the work during riveting operations. Riveting presses are so arranged along the conveyor that as the side rail is pushed along in its cradle to the presses the various spring

ONE of the Side Rail Assembly Lines. The rails, when formed, are hung on a cradle suspended from a monorail and are pushed along a line of presses that rivet on parts

THE Rails Pass from the Rail Assembly Line to the Rack in the Foreground, on Which the Frames Are "Nailed" Together with Rivets Driven in by Hand. Then the frames are suspended on the carrier in the background for the riveting operations

THE Bulldozer Riveting Machine for Driving Top and Bottom Flange Rivets Is Designed So That It Will Tilt to Meet Various Angles; Consequently the Die Head Can Be Placed at the Proper Angle to Assure a Perfect Riveting Condition. The holding fixture on the frame carrier is so designed that one man can easily turn the heaviest frame to any position required in riveting

COMPLETED
Frames on the Inspection Table. From here they are pushed to the entrance of the cleaning department at the right, where an automatic loading device picks them up and hangs them on an endless chain conveyor

ONE of Two Loading Docks, Showing a Section of the Endless Chain Frame Conveyor, and an Unloading Device that Automatically Detaches the Frames from the Conveyor Hooks and Deposits Them on the Table. Railroad cars for loading are spotted at the left. The conveyor, which is 2400 ft. long, is used to carry the frames through the cleaning and painting chambers and the baking oven, and out to the loading docks

FFRAME Parts, After Being Baked, Are Carried by Conveyor to a Loading Station. Here the parts are piled into shop boxes, which are moved by electric truck alongside open-top railroad cars

An Overhead Crane Dumps the Boxes into the Cars. Some of the parts, such as side rails and cross members, are handled in bundles

hangers, motor supports, brackets, etc., are riveted to the rail without removing it from the cradle. On completing this circuit the side rails, with all attachments riveted on, are placed on progressive assembly stands, where the frame is literally nailed together with special rivets in a temporary assembly preparatory to permanent riveting.

Spring Carrier Handles Frame During Riveting Operations

The completely assembled frame, nailed together, is then suspended on a spring carrier so designed that the frame can be quickly attached or detached. The holding fixture is arranged so that the heaviest frame can be turned, rotated or put in any position required for riveting. It is a simple task for one man to handle the heaviest frame. All riveting is done cold, special heat-treated rivets being used for this work. The riveting in the main assembly line is done on a series of specially designed Hanna riveters of the bulldozer type of 20-ton capacity. The design of these machines makes it possible to get in various angles, corners and radii formed by the frame design, making proper allowance for standard mill variations in steel, and drive a rivet which will stand any tests that it may be expected to undergo.

The completely riveted frame, on reaching the end of the conveyor, is delivered to continuous inspection stands, where it is checked for accuracy of dimensions. It is then delivered to a platform for loading into an enamel unit. A special carrier made of steel tubing is quickly attached to the frame, using the spring hanger holes. The frame is then picked up by an automatic loading device, consisting of two endless chains carrying dogs on which the carrier tube rests, and is lifted to a vertical position. When it has reached the proper point, a hook on the main automatic endless chain conveyor grabs the tube carrier between a collar at its center and the frame is automatically transferred to the main conveyor for movement through the washing, enameling and drying unit. The movements of the loader and main conveyor are synchronized and are effected without any man power.

The main conveyor is approximately 2400 ft. long. Frames, which are suspended on this conveyor on 24-in.

centers, pass consecutively through cleaning, rinsing, drying and painting compartments on the first floor up to a baking oven, approximately 650 ft. long, located on the roof of the plant. In the cleaning chamber the frames are washed with hot water containing a cleaning solution, delivered under pressure from above, with live steam discharged through nozzles at the side. In the rinsing compartment hot water flows over the frames, after which they pass into a drying chamber. They then enter the painting chamber, where a special lacquer-resisting primer is applied automatically. From here they move up to the oven, where they are given a 1-hr. drying in a temperature of approximately 400 deg. Fahr. The materials used, the time of drying and the temperature are calculated to deliver a high-class, long-lived weather-resisting finish.

Passing from the oven, the conveyor makes a horse-shoe circuit at the side of the plant over two docks, between which are two spur tracks. This makes it possible to load from either dock, unloading machines being so arranged that selected frames can be removed on one side of the loop with the remainder passing around to the opposite dock.

Automatic Unloading Machines on Each Dock

Automatic unloading machines are provided on each dock. The unloading machines are similar to the loading machines except that the operation is reversed. They are mounted on tracks so that they can be placed opposite the door of the car into which the frames are to be loaded. The unloader is completely automatic and detaches the frame from the main conveyor, allowing it to slide slowly down to a flat table, where the conveyor tube is removed. Frames are stacked on trucks, on which they are run into the box car for loading. The outstanding feature of this conveying equipment is that the entire unit will handle any and all types of frames as they come off the production lines.

A highly efficient production line has been installed for the manufacture of frame parts that are shipped unassembled. This unit starts out with two mechanical presses, one for blanking and piercing and the other for forming the side rails. After they come off the forming press, they are

delivered directly to a continuous rail assembly line, at the end of which they are hung on an endless chain conveyor which carries them automatically through washing, rinsing and drying chambers and then loops downward through a dip painting tank. Moving upward slightly, this conveyor takes the side rails through a baking oven, which is located 10 ft. above the floor, so that working space is available underneath.

The cross members and other small parts are fabricated on specially arranged lines of presses along the side of the baking oven, and a separate conveyor is provided to handle these parts. Each part passes from the blanking, forming and sub-assembly operations in a continuous movement without delays in handling. The workman on the final operation hangs the part directly on a hook of the conveyor, which passes at his side. This conveyor carries the parts along the side of the oven, makes a 180-deg. turn and goes through the same cleaning, rinsing, drying, painting and baking unit that is used for the side rails. The smaller conveyor emerges from the oven near the point at which it was loaded when moving in the opposite direction, and then passes under the oven for unloading.

Some Frame Parts Bundled, Others Shipped Loose

Various parts are removed at predetermined stations. Side rails, cross members and all parts which can be are put in standard bundles. The other small parts are dumped into shop boxes. The bundled parts are picked up with a crane and stacked into gondola cars, from which they are likewise unloaded at the automobile plants. The loose small parts are automatically dumped in partitioned gondola cars, from which they are removed with a magnet at the motor car assembly plants.

The frame parts unit has a capacity of over 2000 completed sets of frame parts in 9 hr. With an average of 46 parts to each frame going through this line, over 92,000 parts are formed from raw steel and are delivered, completely painted, to open-top cars in 9 hr.

In addition to this plant in Cleveland, the Midland Steel Products Co. also has a large plant in Detroit, which will be rearranged in a similar manner, following appropriations just authorized. Through its predecessor, the Parish &

Bingham Co., the company has followed the development of transportation for a third of a century. It was first organized to do a general stamping business, making watch cases. It launched out into the transportation field of the day, by making hardware parts for horse-drawn vehicles, harness, etc. When the bicycle came into vogue the company was a large manufacturer of sprockets, and in 1903, which was the year the first pressed steel channels were developed, it went into the automotive field. The following year marked the company's first production of automobile frames.

The company, with its predecessor, claims to have produced a greater percentage of automobile frames manufactured in the United States than any other single unit. In the past 10 years it has manufactured 12,432,000 automobile frames, which is 44 per cent of the 28,000,000 automobiles manufactured in the United States during that period.

Factory Payrolls Influenced by Speculation

Factory payrolls move inversely with speculation in securities and with money rates, according to Alvan T. Simonds, president Simonds Saw & Steel Co., Fitchburg, Mass., in an article in the July 1 issue of *Looking Ahead*. Five charts, for the years 1919-1921, 1920-1923, 1921-1924, 1923-1925 and 1924-1928, show that factory payrolls increase following decreasing speculation and lowering money rates and that payrolls decrease following increasing speculation and increasing money rates.

"What is going to be the effect upon factory payrolls, upon the amount of manufacturing done in the United States during 1928 and 1929 and possibly 1930 and 1931, of this four years' upward spurt in speculation (1924-1928)? We make no prediction," says Mr. Simonds. "We do not even claim that bull markets will always be followed by decreasing factory payrolls. If this is always the case, it makes little or no difference whether the one that comes first is the cause of the other or not.

"When speculation turns down in the next bear market, it will mean, according to the charts, that some months later factory payrolls will begin to increase and continue to increase for as long as the bear market continues."

PARTS for Frames That Are Shipped Unassembled Are Made on This Row of Presses. They are then suspended on a conveyor directly back of the presses, which carries them through the cleaning departments and baking oven, one side of which is shown in the rear

More Apprentices, Fewer Unemployed

Unskilled Workers Suffer Most in the Displacements Due to
Machines, Yet the Skilled Are Scarce—One-Operation
Men Are No Solution of the Problem

BY C. J. FREUND*

BUSINESS men have paid a great deal of attention in the past half year to the problem of unemployment. In fact, it may be said that they have given more thought of late to that subject than ever before, probably for the reason that the last half year has seen the most serious period of unemployment since industrial leaders learned to appreciate fully the detrimental effect of unemployment upon business conditions. Social workers and social agencies do not ordinarily influence business men directly to any great extent. However, in recent months sociologists have disturbed the American business mind with reports of many men out of work, and hence out of the market to a large extent and an additional burden upon the various communities.

Estimates of the number of persons unemployed in February varied greatly, ranging between one million and four million. Secretary Davis of the Department of Labor considered the number to be about 1,800,000. But the lack of exact figures did not shake the general conviction that unemployment was serious and many committees and commissions undertook a careful study of the question.

Labor-Displacing Influences Steadily at Work

The problem appears to be particularly pressing because economists have pointed out that unemployment is no longer the result of temporary depressions only, but has been brought about by the greater mechanization of manufacturing processes and is a permanent and growing condition which becomes more or less severe, but will not disappear altogether.

The constant invention and installation in manufacturing plants of machines and processes whereby one or two men can turn out more work in a day than a dozen men were able to do in a week ten years ago is bound to have its effect upon the lives of the people in our cities. In the oil industry, for instance, output has increased 85 per cent in the last four years while the number of employees in the industry has decreased 5 per cent in the same time. In the meat packing industry production has increased 20 per cent and employment has decreased 19 per cent since four years ago. Similar conditions obtain in most industries.

Many Material Handlers Lose Places

Unfortunately the unskilled worker suffers first in a period of less employment and suffers most. There is an element of tragedy in the fact that the man who has the smallest income is usually the first to be thrown out of work. Besides having the smallest and most uncertain income, the unskilled laborer, if married, is almost certain to have a larger family than his more fortunate fellow workers in the skilled trades and in clerical positions. However, it is but natural that the untrained man should be most affected in a period of unemployment. The unskilled laborer is the least intelligent of industrial workers, he is least prepared to adjust himself to a change of conditions

in industry. Hence, in the fierce rough and tumble of competition following upon restricted activity in industry, he is the first to be crowded out.

Also, much of the invention of machinery in the last few years has been in the field of material handling, which is the proper field of the unskilled workingman. Formerly, when a car of coal was to be unloaded, a half dozen men were hired to shovel it over the sides and a half dozen more brought it in wheelbarrows to bins or piles where it was stored. Today, the car is lifted above the pile of coal and its bottom drops out, or the car is emptied by turning it upside down. It is not so long since truckers in machine shops brought work from one machine to another. These truckers have been very largely replaced by mechanical conveying systems. Everywhere the common laborer finds less and less demand for the strength which is all he can offer to industry. In 1922 there were 80 applicants for every 100 common labor jobs in the State of New York. Today, every hundred of such jobs attracts 400 applicants.

Yet Skilled Workers Are Scarce

On the other hand, manufacturers everywhere find it impossible to get sufficient skilled mechanics. On account of the laws restricting immigration it is no longer possible to import skilled men from Europe, and until the laws were passed American manufacturers did not realize the extent to which they were dependent upon European skill. In the past, American boys have shown no considerable tendency to go into trades because they have been taught, however indirect and unintentional the teaching may have been, that any kind of manual work, or any occupation involving manual work, was beneath the dignity of an American citizen of the finest type.

As a result, employment agents go out looking for mechanics, even though great numbers of men are waiting in their anterooms and still greater numbers in the public employment offices. Not long since a foundry employment manager was unable to find 20 molders, although thousands of men were said to be out of work in the city. He made efforts to import them from other centers but failed. Less than five months ago a prominent machinery manufacturer expanded his business and sought 65 high-class machinists. To this day he has not got those 65 machinists together, although there were, and may still be, many hundreds of men waiting at the various local public employment offices. Everywhere one hears the same story: great numbers of men who call themselves mechanics in various lines but very few who are really capable of doing first class work.

Unskilled Men Must Be Trained

This shortage of skilled mechanics when large numbers of unskilled men are out of work suggests the obvious wish that a portion of the unskilled men for whom there is no work were trained mechanics for whom there is a distinct demand. But this wish need not be a wish merely. It suggests the possibility of partial relief and solution of the

*Apprentice supervisor, Falk Corporation, Milwaukee.

problem. Of course, it is impossible to transfer the best men in the unskilled class to the rank of mechanics as easily as marching them from one side of the street to the other. *Nevertheless, it can be done; it can be done by means of industrial training.*

Only the will of the manufacturer is necessary; the material is already there. Every superintendent and works manager knows that the unskilled men in his plant include a number who are energetic, ambitious and responsible, who have a natural gift for mechanical work but who have been denied by circumstances the opportunity to learn a trade. Men of this kind are anxious to improve themselves and if the employer will only provide facilities for learning, these men will soon promote themselves above the laboring class. Is there anything more ridiculous than the attitude of the employer who complains of the lack of skilled mechanics, wonders what to do when laborers are out of work because of material handling equipment which has been installed, admits freely that a number of his laborers have much natural ability, and does nothing about it? He would display much ingenuity in the solution of some problem in finance or production but the training of some of his laborers for better work never occurs to him.

Of course, industrial training will not completely solve the problem of unemployment nor can it be expected to influence the situation to any extent unless it becomes general throughout the country.

Also, since every modern undertaking must be well organized to be successful, apprenticeship suggests itself as the type of industrial training which will be most effective because apprenticeship is the most highly organized industrial training.

One-Operation Men Certainly Not the Answer

There is much more room for trained men in industry than most people realize. One sometimes hears it said that there is no place for the skilled mechanic in modern production industries. The very managers of automobile plants have been known to say that they want nothing except men who can be taught a mechanical operation and are willing to stay at it indefinitely.

But where do such managers find their superintendents, their foremen and inspectors? Who is there to show these same mechanical operators what to do and how they are to do it? Mechanics are necessary in production industries to take care of the maintenance of machinery and to set it up in the first place. Skilled men of the highest class are required to plan and to make the tools and fixtures which make production work possible. Only highly trained men can plan the routing of work, the placing of machines and the proper arrangement and correlation of various departments. Although every machine operator in production industry need not be a trained mechanic, still our production industries offer the skilled workman more opportunities than were ever dreamed of before quantity manufacture came into being.

Mass Production Industries Not All the Story

Besides that, who has said that all American manufacturing is going on a production basis? It will be a long time before locomotives, for instance, will be built by the thousands from one design and assembled and taken out of the shops on a moving production line. Neither is it likely that freight cars will be manufactured in this manner, although the building of locomotives and freight cars, and passenger cars, too, is an industry of no mean importance. The public utilities have grown tremendously in recent years. In a typical American city the consumption of electric power was 106,000,000 kw. hr. in 1916. The power consumption in 1926 was 610,452,000 kw. hr., an increase of nearly 500 per cent in ten years.

Undoubtedly there has been a similar development of electric service in every American city. In order to supply this increased demand for electric power, boilers and gener-

ators must be built together with auxiliary machinery of different kinds. Still, it is unlikely that high production methods will be applied to the manufacture of 60,000-kw. turbo-generators. Furnaces, cars, cranes and rolling machinery must be built for the gigantic steel industry; mining machinery, engines and boilers for ships; printing presses, paper-making machines, equipment for food industries and for chemical industries, machine tools for the use of the varied production industries which depend upon them. All these are branches of manufacturing which do not lend themselves to mass production and in which the trained mechanic is more essential and can find more opportunity than at any previous time in history.

More Trained Men Needed in Sales

Moreover, the manufacture of standardized equipment of different kinds in quantity has created a great demand for highly trained men to do sales and service work. Men are now needed in the field to point out to the customer how standardized machinery and equipment may be adapted to his needs where in years past the customer's engineers designed special machinery to do the work.

Also, the saying is still true that there is always room at the top. A capable superintendent is extremely rare. A first-class foreman is not easily found. In a manufacturing organization of 3000 men, how many could qualify for president? The high salaries paid to industrial executives, even when they are not heavy stockholders, frequently not stockholders at all, is the best evidence of the scarcity of real leadership in industry.

The entire industrial world beckons to the trained man. On all sides, in every department of manufacturing and commercial activity, everywhere there are positions waiting for the man who has a certain skill. Regardless of the number of intelligent and resourceful laboring men who might be given trade training, all could find work to do. Thousands of them would release more experienced mechanics for positions of greater importance and responsibility. The surplus of unskilled men could be reduced indefinitely by transfer to the skilled class without building up a surplus of mechanics, without even satisfying the demand.

Apprenticeship Is Eminently the Solution

Apprenticeship will be particularly effective in relieving the pressure of unemployment among the unskilled because it reaches directly into the heart of the problem. Apprenticeship is the particular course of industrial training whereby the unskilled man becomes skilled, hence apprenticeship will accomplish the transfer of men from the unskilled to the skilled more readily and more efficiently than any other method of education.

Modern apprenticeship will attract large numbers. Fortunately American young men have learned to be suspicious of the old-fashioned, haphazard training programs which were largely promises and exploitation. Experience has shown that when real apprentice training is provided with a contract arrangement, proper supervision, well-thought schedules of work and pay, school work, and careful shop instruction, it is not difficult to attract sufficient boys and young men. In fact, the well established corporations which have been training apprentices for a number of years all have a waiting list for every trade.

Apprenticeship is an institution which produces results, not only for the present but more particularly for the future. The young men who are saved from swelling the unskilled labor class remain good mechanics for years to come and do their share in the training of other young men of a new generation. Again, apprenticeship affects exactly the right type of boys and young men. Regular trade apprentices ordinarily are boys who have not been able to complete their education. The very fact that they become apprentices marks them as being capable and energetic beyond the average, and the type of young men who should be transferred from the unskilled class to the skilled.

Business Analysis and Forecast

Expects Better Business by Fall

Recession Meanwhile of Greater Than Seasonal Proportions
—Renewed Boom Not Looked For

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

CONDITIONS unfavorable to business expansion appear to be predominant and to indicate a period of moderate liquidation and recession during the early summer months. The recession is likely to be of greater than seasonal proportions. Higher money rates and political uncertainties are tending to restrict buying, and the sagging trend of commodity prices—partly a result of the foregoing—reacts to the same effect. Needless to say, however, deflation in the stock market no more forecasts a sharp recession in business than the inflation of last year forecast expansion.

AT present the chief interest centers in finance. The outstanding development in June was the reversal of the stock market's inflationary trend. The large gold supply and accumulation of funds in the hands of corporations, together with the Reserve Bank policy of last year, has led to tremendous inflation in stocks, and the more recent gold exports together with the change in reserve policy finally checked this inflation and brought about a very sharp reaction. Money had come to cost about 6.28 per cent, bonds to yield about 4.4 per cent, and common stocks, after rising to a point where the yield was only 3.95 per cent, even at this writing yield but 4.33 per cent. The return on invested capital and the yield on securities were much lower than interest rates, even commercial

paper rates being higher than the yield on bonds and stocks. The readjustment was bound to come.

Probably this adjustment is not yet complete. Brokers' loans are still abnormally high (we estimate that they should be reduced to about \$3,100,000,000 to be normal), and there is no reason to believe that the Reserve Banks are satisfied. Security yields continue much below interest rates. Under the circumstances, further liquidation is to be expected. But the time will come when, as speculative requirements are reduced and high money rates tend to attract funds from abroad, while yields on securities increase, forces making for easier money will gain the ascendancy and equilibrium will be restored.

Nothing in prospect for industrial earnings now seems

Factors in the General Business Outlook

Favorable

1. Increase in building contracts and permits, and a large volume of structural steel bookings in May
2. Recovery of retail and wholesale trade in May
3. Farm purchasing power improved
4. Large automobile production
5. Increased merchandise exports in May
6. Considerable liquidation in securities without any severe financial disturbance
7. Strong financial position of leading companies
8. Light mercantile inventories

Unfavorable

1. A further decline in the P-V Line
2. Declining commodity prices
3. Declining unfilled orders for steel and other basic commodities
4. Severe competition and narrow profits
5. Increased business failures
6. Unfavorable conditions, with increases in physical inventories, in a number of industries (e.g., textiles, shoes, tires, lard, zinc, paper, sugar, bituminous coal, and some branches of iron and steel)
7. Money rather tight, due to large gold exports and brokers' loans and accumulation of bonds on dealers' shelves
8. The severe setback in the stock market
9. Continued unseasonable weather
10. Political uncertainties

to give reason for expecting a renewed boom in business, nor is there any reason to expect that any considerable proportion of the gold that we have shipped abroad will return. It does seem, however, that by fall the readjustment will be fairly well along and that, with easier money, a sounder valuation of securities, and greater political certainty, the constructive forces may take the lead.

Commodity prices, except in cases of threatened crop shortage, are for the most part sagging. Certainly curtailment is desirable in a number of industries, as stocks of goods are accumulating, notably in the case of zinc, cotton and silk textiles, shoes, leather, and lard. Even in the case of copper, production has recently been gaining on shipments. The decline in the P-V Line is moderate and

DOWNWARD Movement of the P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Appears to be Rounding Off for a Rise. Steel production (adjusted) after rising for five months has turned downward again

UNFILLED Orders Have Declined Further; Stock Prices, Though at a High Level, Are Irregular and Scrap Prices Are Weak. All three indexes point to lower operating conditions

BOTH Building Activity and Automobile Output Showed an Advance in May. They are higher than at the same season in any of the past five years

The P-V Line (a ratio between commodity prices and the physical volume of trade) continued its moderate downward trend in May and, along with other unfavorable indications and the prevalence of uncertainty in several important respects, this trend forecasts a period of moderate recession in general business. As in recent months, this barometer continues to indicate that the activity of industry is somewhat in excess of the demand for industrial products at current prices.

gradual, however, showing no serious maladjustments, though it indicates that demand is relatively weak in comparison with supplies.

The May decline in the adjusted curve of steel ingot production is in accord with the forecast given by the P-V Line early this year, and reflects the decline in unfilled steel orders that began in April. Apparently the influence

(Concluded on page 62)

Metal Studies by Testing Society

Extensive Investigations Under Way on Corrosion-Resistance of Sheets, and Properties of Steel Castings and Die Castings

AT Atlantic City last week, the American Society for Testing Materials held a series of meetings which broke all records for attendance. Growth of this society has been constant since its organization in 1898, but the meeting last year, held at French Lick Springs, somewhat off the main travel routes, was not up to its predecessors. Up to Wednesday evening of last week 808 members had registered (already a record); counting the later arrivals of those who attended discussions on non-metallic materials on Thursday and Friday, the total doubtless approached 1000. Total membership of the society, as of June 1, was 4193. The volume of the society's publication for the last calendar year also sets a record at 3975 pages. Newly elected officers are:

President: G. W. Thompson, chief chemist National Lead Co., Brooklyn.

Vice-President: K. G. Mackenzie, consulting chemist, Texas Co., New York.

Members of Executive Committee: T. R. Lawson, head, department of civil engineering, Rensselaer Polytechnic Institute, Troy, N. Y.; H. S. Mattimore, engineer of materials Pennsylvania State Highway Department, Harrisburg, Pa.; P. D. Merica, director of research International Nickel Co., New York, and Samuel Tobias Wagner, consulting engineer Reading Co., Philadelphia.

Notable Special Addresses

A GRATIFYING innovation was due to the retiring president, Prof. H. F. Moore of the University of Illinois. The audience, gathered to listen to his address, "Hooke's Law of Stress and Strain—an Address Commemorative of the 250th Anniversary of Its Announcement," was wholly unprepared for the brilliant biographical sketch which reached back into a forgotten time and revived the dour experimenter and inventor, and his contemporaries, Robert Boyle, Isaac Newton and other founders of the Royal Society.

Dr. Frank B. Jewett, in the Edgar Marburg lecture, also departed from the custom of discussing some phase of materials testing. He described in broad outlines the 15-year research which preceded the establishment of

transoceanic telephony. A moving picture then showed the special apparatus and personnel required to complete a call from America to Great Britain by means of long distance land lines and a wireless stretch across the north Atlantic. Such powerful sending stations require vacuum tubes

H. F. MOORE
Retiring President

with capacities measured in horsepower rather than watts; the lecturer dwelt upon the refinement and research in materials which have made possible such tubes.

A third pleasant event was the award of the Charles B. Dudley medal to A. V. de Forest. It is given each year for the most meritorious paper read before the society. His paper appeared in a symposium on magnetic testing, and was entitled "A Method of Graphic Representation of Magnetic Characteristics." It described automatic equipment which will probably result in a more rapid adaptation of such testing methods to commercial problems. A brief description of Mr. de Forest's method was printed on page 1459 of THE IRON AGE for May 19, 1927.

Researches on Metals and Alloys

A PRONOUNCED change in the activities of the American Society for Testing Materials, especially in so far as metals are concerned, is apparent. During the early years of

its existence the various committees had a busy time to harmonize the differences between the desires of the producers and the consumers of tonnage commodities. Satisfactory agreement having been reached on trade customs, it then became evident that many questions remained of a more technical nature, and about which little or no precise information was available. Consequently the active committees at present are those which are engaged in some research to clear up questions of fact. No less than 26 of such projects are now under way, in the field of metallic materials alone.

Sulphur and Phosphorus in Steel

AS an instance, a committee to investigate the effect of phosphorus and sulphur in steel was organized in 1919, under the chairmanship of Dr. George K. Burgess, director Bureau of Standards. This committee has enjoyed the cooperation of many organizations and firms and has been able to report as the result of a thorough investigation that residual sulphur up to 0.077 per cent is not detrimental to steel plate (see THE IRON AGE, July 3, 1924, page 55) nor to rivet steel in quantities up to 0.06 per cent (see THE IRON AGE, July 1, 1926, page 5). In order to make a similar study of steel for forging, containing less than 0.02 per cent phosphorus, a series of eight basic open-hearth heats has been made under observation by Jones & Laughlin Steel Corporation, ranging in residual sulphur from 0.031 to 0.116 per cent, rolled and distributed for test.

It has also been decided that the influence of phosphorus on steel castings is that phase of the phosphorus problem of most immediate importance. Consequently the Atlantic Steel Castings Co., Chester, Pa., has made eight heats in a 10-ton stationary acid open-hearth furnace. Series A with low carbon has phosphorus ranging from 0.025 to 0.10; while phosphorus in the higher carbon castings in Series B does not go so high. Funds for the work were raised by the American Foundrymen's Association and the Steel Founders' Society of America. Test bars were made in open molds of dried sand, six bars 1½ in. square by 12 in. long being cast

on the bottom of a large block. The test bars are then cut off, cleaned and equal portions of Series A were given the following heat treatments before testing:

Annealed bars: Heated to 1650 deg. Fahr., held 2 hr., cooled in furnace (1600 deg. Fahr. for Series B).

Normalized bars: As above, but removed from furnace and cooled individually in still air.

Normalized and drawn: After normalizing, reheated to 1150 deg. Fahr., held 3½ hr., cooled in furnace (1250 deg. Fahr. for Series B).

In cooperation with the American Petroleum Institute, a program is being formulated to study the effect of added phosphorus on the weldability of pipe steel, and on the properties of pipe made therefrom. These tests will cover the range of carbon 0.06 to 0.12 and phosphorus 0.025 to 0.10.

Corrosion of Metal

ANOTHER research committee, headed by J. H. Gibboney, Norfolk & Western Railway Co., placed various kinds of sheet steel on outdoor racks some 12 years ago, and has been observing the condition periodi-

cally since. Failure in smoky atmosphere was rapid. The rack in the clear air of Fort Sheridan, Ill., has been dismantled, since it is apparent that the sheets are failing in substantially the same order as at Pittsburgh, namely, copper-free materials first; copper-bearing iron and steel later. Failures at Fort Sheridan in the non-copper-bearing groups have occurred after 37 months' exposure; copper-bearing sheets started to fail only after 130 months.

Tests on similar sheets submerged in fresh water, brackish water and mine water show that corrosion resistance of submerged iron and steel sheets is practically uninfluenced by copper content.

These exposure tests have attracted such wide approval that two years ago an inclusive series of steel sheets having commercial zinc coatings (hot galvanized sheets) were exposed at five different localities. It is too early to observe anything but the early stages of corrosion, but in time this test will answer many questions regarding the mutual effect of thickness and composition of the coating and of the underlying metal. Several thou-

sand samples of coated wire, fencing, conduit, pipe, bolts, hardware and structural shapes are now being collected and will be placed on test racks this autumn. Several railroads and highway departments are cooperating in a plan for similar investigations of flexible metal culverts.

Corrosion of non-ferrous metals is also to be studied. A comprehensive plan has been outlined by a committee under T. S. Fuller, General Electric Co., and \$4,250 subscribed toward the necessary expenses. Twenty commonly used alloys will be exposed in sea water, in "mother liquor" from a salt works, in caustic soda solutions from chemical and paper factories, in hydrochloric and sulphuric pickling solutions. Galvanic and electrolytic effects will also be studied by exposing standardized couples of various metals to atmospheric corrosion, and to various solutions as noted above.

Properties of Structural Steel

A research committee on the yield point of structural steel, in which the Association of American Steel Manufacturers, the American Railway Engineering Association, the American

F. B. JEWETT
Marburg Lecturer

FRANK B. JEWETT, vice-president of American Telephone & Telegraph Co., and head of the Bell Telephone Laboratories, delivered the third Edgar Marburg Lecture. He graduated in 1898, taught electricity and physics at Massachusetts Institute of Technology, and joined the engineering department of the Telephone Co. in 1904. From 1912 to 1925 he was assistant chief engineer, chief engineer and vice-president of Western Electric Co. He has received many honors from learned institutions and national governments.

G. W. THOMPSON, the new president of the society, is a director of National Lead Co., and its chief chemist since 1892. He has also been president of the American Institute of Chemical Engineers (1918). In 1927 Armour Institute of Technology conferred on him the degree of Doctor of Science. His principal interests in the American Society for Testing Materials has been in preservative coatings for structural materials and in the general methods of testing.

G. W. THOMPSON
The New President

A. V. DE FOREST
Dudley Medallist

A. V. DE FOREST is research engineer for the American Chain Co., Inc., Bridgeport, Conn., having held that post since 1918. Mr. de Forest is a graduate naval architect from Massachusetts Institute of Technology (1912) and did post graduate work in metallography at Princeton and Columbia Universities. Prior to joining the Laboratory of the American Chain Co., he was for two years in the research department of the Remington Arms Union Metallic Cartridge Co. He is well known among the members of the Steel Treating society.

New Members, Executive Committee, American Society for Testing Materials

H. S. MATTIMORE

P. D. MERICA

S. T. WAGNER

Society of Civil Engineers and the American Institute of Steel Construction are cooperating, reported through its chairman, M. O. Withey, professor of mechanics, University of Wisconsin.

Six hundred specimens were made by the Illinois Steel Co., cut from three grades of round steel bars, selected from very uniform heats of ordinary bridge steel and nickel and silicon structural steel. Five laboratories then determined the influence of the speed of testing. Stress at the yield point was determined by four methods, viz., drop of beam, scaling of specimen, use of multiplying dividers to note 0.5 per cent strain, and acceleration of a sensitive strain gage.

All steels showed a consistent increase in yield point as the speed of pulling increased. For instance, silicon structural steel bars have a yield point of 49,500 lb. per sq. in. when pulled at the rate of 0.05 in. per min., but show a yield 6500 lb. higher when pulled at 2 in. per min. The corresponding difference for carbon steel is 3900 lb. and for nickel structural steel 4800 lb. In discussing this point, L. B. Tuckerman of the Bureau of Standards said that the scatter between results of different laboratories and different methods of test would be even less at lower testing speeds. H. E. Smith, engineer of materials New York Central Lines, emphasized the practical point that the greatest discrepancies in rapid testing come from overrunning the counterpoise in an attempt to keep it balanced against the increasing load; thus a fictitiously high yield point is shown at the drop of the beam.

Professor Withey's committee also tested a large number of pieces taken from mill run structural shapes and plates. The above results of rapid loading were noted, somewhat more

intensified. He believes that the indications of the proportional divider are the most positive; scaling occurs at about 5 per cent above the yield point determined by dividers. It is

also noted that shapes $\frac{3}{8}$ in. thick have a yield point 11 to 19 per cent higher than those with flanges or web $\frac{7}{8}$ in. thick, when the samples are cut from corresponding places on the cross-section. In such testing, large

differences may be expected if samples are taken at random, on account of the influence of ingot segregation at the top and of various amounts of working during rolling on different portions of the cross-section.

This latter point was emphasized in a second paper by Professor Withey, entitled "Tests of Specimens Cut from Different Portions of Structural Steel Shapes." Nearly 400 tests were cut from carbon steel H-beams, channels, angles and plates, such as are fabricated into columns. The table shows the average results, where "highest average stress" represents the weighted average for a single cross-section, figured from the various test pieces taken therefrom. Considerable variation occurred in the 10-in., 20-lb. channels; mean values are as follows:

	Tension	Toe	Root
Ultimate strength (lb.)...	54,500	52,500	
Elongation in 8 in. (per cent)	19.1	28.6	
Yield point (lb.).....	33,900	31,400	
Proportional limit (lb.)...	28,400	27,300	

Such differences in ductility are not due to carbon segregation or differences in grain size. The lowest values noted were as follows:

Ultimate strength: 48,000 lb. per sq. in. in the root of a 10-in., 20-lb. channel.
Elongation: 13.0 per cent in the root of a 10-in., 15-lb. channel.
Yield point: 27,600 lb. per sq. in. in the root of a 10-in., 20-lb. channel.
Proportional limit: 14,700 lb. per sq. in. in the toe of a 10-in., 20-lb. channel.

Basing judgment on weighted averages for whole shapes, the most representative specimen for H-columns may be obtained from the middle of the outstanding flanges. For the channels the web specimens best represent the average in strength tests and the root specimens in elongation measurements. For plates, specimens from the centers are somewhat less variable than the edge specimens and just as representative.

Die Castings Under Investigation

Under chairmanship of H. A. Anderson of the Bell Telephone Laboratories a committee of leading producers and consumers of die castings has embarked on a program that will require the manufacture and testing of approximately 45,000 alumi-

(Concluded on page 61)

Ranges in Average Properties					
Property Tested	Kind of Stress	Highest Average Stress, Lb. per Sq. In.	Shape Having Highest Stress	Lowest Average Stress, Lb. per Sq. In.	Shape Having Lowest Stress
Proportional limit	Tension	39,700	8-in., 32-lb. H-column	25,100	10-in., 20-lb. channel
Yield point	Tension	41,800	8-in., 32-lb. H-column	31,700	10-in., 20-lb. channel
Ultimate strength	Tension	64,200	8-in., 32-lb. H-column	52,200	10-in., 20-lb. channel
Proportional limit	Compression	37,600	10 by $\frac{7}{8}$ -in. plate	22,500	10-in., 15-lb. channel

Care of Anti-Friction Bearings

Chicago Meeting of Association of Iron and Steel
Electrical Engineers Was Given Over
Also to Electric Drives

DEVELOPMENT and conservation of power, as well as distribution of cost of energy; application of electric drives; control instruments and anti-friction bearings were foremost among the topics discussed by members of the Association of Iron and Steel Electrical Engineers at their twenty-fourth annual convention, held June 25 to 28 at the Hotel Stevens, Chicago. Ninety-five manufacturers displayed advanced equipment in the exhibition hall of the hotel.

Value of Ball and Roller Bearings Stressed

DISCUSSING anti-friction bearings for roll necks, J. H. Van Campen, chief engineer E. W. Bliss Co., Salem, Ohio, stated that success depends principally upon three factors: (1) Selection of the proper type and size of bearing; (2) proper mounting of the bearing on the roll neck; (3) lubrication of the bearing.

"Of the various types of mills," he said, "the backed-up type such as the cluster mill and the four-high mill offer the best conditions for anti-friction bearing applications, as the allowable space limits are greater than in any other type of mill. Next comes the two-high mill, and last the three-high mill. The greatest percentage of anti-friction bearing applications to date have been made on the backed-up type of mills.

Keeping Dirt Out of the Bearing

"In sealing anti-friction bearings used on roll necks, and where the speed conditions permit, the most effective method appears to be in applying grease, which should be made from a good grade cylinder stock oil having a viscosity of 150 sec. at 100 deg. Fahr. universal Saybolt, under a slight constant pressure. Pressure

applied should be so that there is a small leakage of grease from the seals. This will not allow any infiltration of dirt, scale or water, and will give protection to the bearing.

"Another important feature, essential to the success of anti-friction bearings on roll necks, is the care used by mill crews when removing and replacing the bearings during roll changes. These bearings are a fine piece of mechanism and very expensive. Therefore, no dirt should be allowed to get into the mountings when they are removed. The roll necks should be cleaned thoroughly when replaced, and the bearings properly adjusted in the mill before beginning operations.

"There is no doubt that it would be well worth the time and expense of mill operators using anti-friction bearings to take the bearings out of their housings and thoroughly clean them with a light oil about every six months, to eliminate accumulation of dirt, grit and so forth, which gets into the bearings, as this would greatly prolong their life.

"There are today approximately 150 mills in this country which have anti-friction bearings on the roll

necks. Most of these have been installed during the past two years."

Bearings from Viewpoint of Operator

THAT the ball or roller bearing is not a panacea for all bearing trouble was admitted in a paper on "Anti-Friction Bearings for Electric Motors," by J. S. Murray, electrical engineer, Follansbee Brothers Co., Follansbee, W. Va. "Properly selected and applied, however, they offer a definite and tangible return on investment. Improper application, except in rare cases, results in unsatisfactory service and high maintenance costs. The fundamentals of anti-friction bearing practice must be understood, to obtain its most satisfactory performance.

"Due to the comparatively small width of anti-friction bearings, the projected area between the bore of the inner race ring and the outside diameter of the shaft leads to high values of pressure under usual operating loads. This pressure will amount to from 500 to 1000 lb. per square inch. This intensity of pressure requires a positive means for securing the two together, to prevent relative

Salient Facts on Motor Drive

ECONOMIES in electric operation have resulted in practically a 100 per cent application of motor drive in new mills laid down in recent years. Fully 55 per cent of all rolling mills in this country are now electrically driven. Main roll electric drives represent over 2,000,000 installed horsepower, and this is increasing at the rate of 13 per cent annually.

Steel mill power plants are now using individual generating units as large as 30,000 kw.

Since 1919 the steel industry has increased tonnage output per wage earner by 56 per cent.

rotation. If clearance exists between these parts, there will be a rotation similar to that of a spur gear meshing with an internal gear of slightly larger pitch diameter. This creeping under high pressures will develop destructive wear of shaft, with heating. To overcome this, it is necessary to have a press fit of inner race on the shaft, and whenever possible secure the race against a shaft shoulder by an adequate locking device.

Ample Lubrication Essential

"Today there are few motors built which do not provide for ample lubrication space, to allow for enough grease or oil to insure operation over a long period of time without renewal. There is little wearing out of the lubricant, since it has only two func-

tions to perform. The first is to lubricate the parts of the retainer in contact with the balls or rollers and the second to keep the highly polished surfaces from corrosion. As a result, only a small quantity of oil or grease is required, and consequently the lubrication problem is greatly reduced. Several manufacturers now make a neutral mineral lubricant which is desirable for anti-friction bearings. At intervals of from one to two years, the old grease or oil should be replaced with new lubricant. The only precautions which need be taken are to keep the lubricant clean and not to use too much of it.

"Where there is a long overhang of the shaft beyond the bearing, or where the load to be carried is large, it is usual practice to mount a roller

bearing at the drive end of the shaft, with ball bearing at the opposite end for thrust. This arrangement obviously eliminates difficulties due to expansion of the shaft, as the rollers of the roller bearing may move laterally across the face of the outer ring.

"On very large motors, subjected to heavy radial loading with comparatively light end thrust, a combination of two roller bearings is employed. The roller bearing at the closed end of the motor is of the self-contained type, locating the armature endwise, while the drive-end bearing is of the separable type. Some manufacturers prefer to use the self-contained roller bearing at each end of the shaft, in which case the drive-end bearing is allowed to float endwise."

Electric Drive for Rolling Mills

SELLECTION of motors for main drives of merchant, bar and rod mills was discussed by C. B. Houston, General Electric Co., Schenectady, N. Y. After reviewing the development of various types of mills and their drives, he called attention to the fact that there are now in use on both rod and merchant bar mills about every form of motor, both alternating and direct current, that exists. There is to be also the wound-rotor induction motor with almost every conceivable form of speed-adjusting equipment—Scherbius, Kraemer and frequency-converter types. Some of the latter are in operation at the International Nickel Co., Huntington, W. Va., and also at the Laclede Steel Co., St. Louis. Alternating current adjustable-speed, brush-shifting motors are applied to the 14-in. and 9-in.

mills at the Halcomb Steel Co., Syracuse, N. Y.

"Strange to say, it was not until early this year," he said, "that the first synchronous motor has been sold for driving a rod or merchant bar mill. This is an 800-hp., 300 r.p.m., 85 per cent power factor, 2200-volt, 60-cycle motor and is intended to drive four stands of the 10-in. merchant mill No. 2 at the Madison, Ill., works of the Laclede Steel Co.

Tendency to Use Direct Current

"Direct current motors, with their adjustable-speed characteristics, are used with and without regulating devices. In fact, there is an ever growing tendency toward a greater use of direct current because of the flexibility which its application makes available in operation of the mill.

Direct current motors are applied even on continuous rod mills, where not many years ago alternating current motors with some form of speed adjustment were used. This is true even at some additional expense of initial cost or lower efficiency, although, with the improvements which have been made in recent years in the design and manufacture of direct current apparatus, there does not always exist a differential either in cost or efficiency in favor of alternating current machines. For the continuous and for many of the semi-continuous mills only direct current can logically be considered, as for example the Illinois Steel Co. 10-in. mill No. 4, or even the Bourne-Fuller Co. new 10-in. merchant mill.

[Other topics will be reported in next week's issue.]

Two Pacific Coast Uses of Steel

Metal net coverings over manholes (left) are used by the Pacific Gas & Electric Co., San Francisco, to protect workers in the manhole and to keep pedestrians from falling into them. The coverings consist of two frames hinged in the center and covered with wire sufficiently strong to bear the weight of an automobile.

A portable safe (right) carries cash between the cashier's department of the Emporium department store in San Francisco to the bank's money truck. It is regarded as too heavy for bandits to pick up and yet may easily be wheeled along by one person.

Productivity Per Man Employed

Study of Pig Iron Output as Symptomatic of Manufacturing in General—Enormous Gain in 75 Years

PRODUCTION of pig iron in the United States increased 7178 per cent between 1850 and 1925, while during the same period the production per man increased 4928 per cent, according to Ethelbert Stewart, commissioner of labor statistics, Department of Labor, in an article on productivity of labor appearing in the June number of *Monthly Labor Review*. In 1850 the number of employees at the blast furnaces was 20,298, while the output was 504,245 gross tons, and the production per man was 25 tons. In 1925 the number of employees was 29,188, the output 36,700,566 tons and production per man 1257 tons. Using 1850 for the index number 100, the 1925 productivity index number is 5028.

Mr. Stewart pointed out that the purpose of his article is to show the great and continuous spread over three-quarters of a century between the number of employees and the volume of production. After showing that there was employment of less than 9000 more persons at blast furnaces in the 75 years, or an increase of 44 per cent, Mr. Stewart declared that the manufacturing industries, particularly as represented by the blast furnaces, are not going to take care of the increase in the working population. He did not go into the question of increased consumption of pig iron per capita, nor did he deal with production along the lines of two articles by W. S. Pilling in *THE IRON AGE* of June 6, 1912, and in *THE IRON AGE* of April 28, 1921, showing production of pig iron by decades, both in tons and per capita of population.

Without referring by terms to the modern mechanization of the blast furnace and the vast increase in its capacity as compared with former years, Mr. Stewart's discussion is reminding of this subject and the problem which he sees is stated as follows:

"Concretely stated, the facts are these: The increase in population from 1850 to 1925 was 397.5 per cent. If we take blast furnaces as an example, the take-up of this population by industries increased 44 per cent. Production increased 7178 per cent. Production per man increased 4928 per cent. Stated differently, the number of wage earners in blast furnaces in 1850 was 882 per million of population. In 1921, which, however, was a slump year, there were 173 wage earners in this industry per million of population. And many other industries, while not so spectacular, showed the same tendency.

"It must be apparent that the at-

titude which one will take toward these figures will depend upon whether one is interested in the prosperity that comes from enormous production and almost startling output per employee or whether one is looking for a job. The problem of today is to reconcile these two points of view."

In his table the number of employees engaged at blast furnaces in census years (except 1880) is taken from the census reports. In 1880 the Bureau of Census so classified this

71 years earlier. While production in 1921 was only about half what it was in the preceding census year, it still showed an index number of 3310, while the output per man-year dropped to 331 tons, the index number being 1324, against 3180 in 1914 and 2864 in 1919.

"The tremendous slump in productivity just after the war deserves a much more careful study than it has received. We do not know all of the factors entering into this. The slump was world-wide, affecting the coun-

group that the employees shown included those in foundries and a number of other industries, which made the figures for blast furnaces in that year unusable. In 1890, however, the census returned to its old classification. The figures of total production of pig iron in the United States were taken from the census reports from 1850 to 1890 and the reports of the American Iron and Steel Association from 1899 to 1925.

It was pointed out by Mr. Stewart that between 1850 and 1870 there was no great divergence among the three factors of production, employment and output per man-year. From 1870 on, he explained, the trend of production was sharply upward. The index number in 1870 was 363. By 1890 the index of production had reached 1754 and the index of output per man-year 1060, while the employment index was 165.

"One of the more puzzling problems revealed by this presentation," said Mr. Stewart, "is the tremendous drop in 1921. Actual employment dropped below the figure of 1850, or

tries which did not participate in the war with almost as great severity as those that did. One of the perfectly apparent reasons is the demoralizing effect upon all labor of the cost-plus plan of letting contracts during the war. Under a cost-plus plan the less a worker does the more valuable he is to his employer, and petty bosses were not slow in making this apparent to the workers themselves. We are fortunate in having recovered from the influence of that diabolical scheme as rapidly as we have.

"A second clear explanation is that the younger, more enthusiastic, energetic and 'peppy' employees in all industries enlisted for the war, leaving a much less experienced and less dependable group of workers to take care of industry. Even when the enlisted men returned, the mental and physical effect of the war was very noticeable for some time.

"Another cause, and perhaps a more easily measurable one, was that, though production fell from practically 37,000,000 tons in 1920 to less

than 17,000,000 in 1921, a certain proportion of the employees must be retained if the plant is to operate at all, and that regardless of production. An apparent weakness in this reasoning is developed by the fact that the index of employees fell much more noticeably than did the index of production. For instance, the index of employees in 1919 was 213 and in 1921 it was 92, while the index of production dropped from 6151 to 3310.

"In view, again, of the widespread decrease in productivity, affecting Denmark, Norway and Sweden practically as much as it did England and the United States, attention must be called to the fact that a more comprehensive study of that slump than has yet been made is needed.

"Even the second reason here as-

signed is not entirely defensible, for as jobs become scarce there is the general tendency to work hard to hold on to the job in hand."

Referring to the chart accompanying the article, Mr. Stewart pointed out that it shows that, while production declined from 1909 to 1914, production per man per year was going steadily up, and that, while total production from 1914 to 1919 was going up rapidly, production per man per year was going down. It was explained that the chart, while drawn in continuous lines, is really a "spot" chart and speaks for census years only, because the number of employees, which is the essence of the calculations, could be secured only for census years. From 1850 to 1900 these censuses covered 10-year periods; from 1900 to 1919 they covered 5-year

periods; since 1919 they have covered 2-year periods.

"Therefore, when we say that production declined from 1909 to 1914, it does not mean that this was true of each year during the period," Mr. Stewart said, "and as a matter of fact it was not true. But from the very inception of the war, and before the United States entered the conflict at all, production per man began to decline. On the other hand, from 1923 to 1925 production dropped sharply while output per man per year went steadily upward. And these facts likewise are shown the world over, in so far as productivity figures in foreign countries are available and dependable. The psychological effect of war upon human productivity is here only suggested. There is no serious attempt to furnish an answer."

Scrap Prices Drop Sharply at Close of First Half of Year

June Shows Lowest Average Since December — Second Quarter Average Above First Quarter

AVERAGE prices of heavy melting steel scrap at Chicago, Philadelphia and Pittsburgh developed weakness about the middle of May and have been going down ever since. The average on May 15 was \$14 a gross ton, which has given way to \$13.25 at the end of June. With one exception, every week in that period showed a decline. At \$13.74, however, the average for the second quarter was above the \$13.69 average for the first quarter of the year. In the second quarter of 1927 the average was \$14.09 a ton.

Meantime, pig iron has dropped, all through the second quarter of the year, to the lowest level it has had in more than 12 years. The differential between THE IRON AGE pig iron composite at the end of June and the scrap average was less than \$4 a ton. This compares with more than \$6 a ton about two years ago.

Finished steel has had only slight fluctuations since early 1927. It has declined during the second quarter to 2.341c. a lb., which, with the exception of the level of last fall and early

winter, is the lowest it has had since the summer of 1922.

Comparative figures for 30 months, covering steel scrap, pig iron and finished steel, are given in the table. The diagram carries the story of these changing prices over a period of more than four years.

SKF Dominant in German Bearing Industry

HAMBURG, GERMANY, June 16.—With the acquisition of the Riebewerke, the Svenska Kegellager Fabriken Aktiebolag (SKF), is a dominant figure in German production of roller and ball bearings. With a plant at Stuttgart, Germany, SKF has been manufacturing for some time and recently instituted suit against the Riebewerke for infringement of patents. This was followed by the purchase of the Riebewerke by SKF. There are now only two German ball and roller bearing manufacturers not controlled by the Swedish company.

Scrap Has Gone Lower in Recent Weeks, Reaching Almost the Low Level of Last Fall. Pig Iron is the lowest it has been in almost 13 years and finished steel is below its prevailing level of the past 5 years

June Pig Iron Output Declines

Estimates, Collected by Wire, Make the Daily Rate 3221 Tons or 3 Per Cent Less Than May—Net Loss of 8 Furnaces

ACCORDING to data gathered by wire on July 2 from producers estimating their output in most cases, the June production showed a decline from that of May of about 3 per cent. The estimated total for last month was 3,081,300 gross tons, or 102,710 tons per day. This compares with an actual production in May of 3,283,856 tons, or 105,931 tons per day. The decline in June was therefore 3221 tons per day, or about 3 per cent. In May there was a decrease from April of about $\frac{1}{4}$ of 1 per cent.

These preliminary returns indicate that there were six furnaces blown in and 14 shut down in June—a net loss for the month of eight furnaces. The number operating on July 1 was apparently 190 furnaces, against 198 on June 1 and 195 on May 1. The prin-

cipal loss was in steel making furnaces.

Actual data for the June pig iron production will be published in THE

IRON AGE, July 12. The table gives the estimated production by districts for June and the actual output for the three preceding months.

To Reorganize New York Metal Exchange

At a meeting of the stockholders of the New York Metal Exchange, 23 William Street, New York, Thursday, June 28, it was decided to revise the rules and reorganize the exchange. The object is to make the institution a more active factor in the non-ferrous metal markets. Activities will center first in the tin market, with the aim of augmenting dealings later in zinc, lead and copper.

Malleable Castings Orders Ahead of Last Year's

Production of malleable castings in May totaled 61,458 net tons, against 56,880 tons in April, according to reports received by the Department of Commerce from 133 identical plants, seven of which, with an aggregate monthly capacity of 3850 tons, were idle during May. Except for March, production in May was the greatest for any month in more than a year. It compared with 57,655 tons in May, 1927.

Orders booked in May amounted to 54,429 tons, against 53,099 tons in April, while operations were at the rate of 67.3 per cent and 62.5 per cent respectively. May shipments involved 58,264 tons, compared with 57,372 tons in April. Shipments in May were the largest, except for March, in more than a year. Last May the total was 57,269 tons.

For the five months ended with May production aggregated 295,523 tons, against 292,124 tons for the corresponding period of last year; orders

were 276,830 tons and 268,438 tons respectively; operations, 64.5 per cent and 55.2 per cent, and shipments, 280,076 tons and 286,374 tons.

Addition Built for Expansion Upward

Heavy foundations in a new building being added to the plant of the Brown Instrument Co., Philadelphia, will permit other floors to be added later, as requirements demand. The present structure will be two stories high, measuring 44 x 60 ft. in plan. Construction will be of the fireproof type.

This is the third addition made to the Brown plant within the last eight years. Its primary purpose is to provide research facilities needed with the rapid expansion in the variety of the company's products and a continual widening in the application of instruments to the activities of industry and science.

Bar Iron Plants May Be Merged

Charles Hart, president Delaware River Steel Co. (which operates a blast furnace at Chester, Pa.), who recently became active in the management of the Lebanon Iron Co., Lebanon, Pa., is negotiating for the purchase of the Scranton Bolt & Nut Co., Scranton, Pa., with a view to the consolidation of the properties. C. E. Brodhead, vice-president Scranton Bolt & Nut Co., informs THE IRON AGE that nothing has been concluded.

The Scranton company was organized in 1899 and has been an important factor in the East in the manufacture of iron bars, bolts and nuts and spikes. Its annual capacity is about 40,000 tons of bars. The Lebanon Iron Co. has an annual capacity of about 35,000 tons. Included in the equipment of the Lebanon plant are eight Ely mechanical puddling furnaces.

Will Increase Output of Auto-Body Sheets

The Otis Steel Co., Cleveland, through its board of directors, has authorized the carrying out of an expansion program in order to increase its output of full finished automobile body sheets. The plans contemplate additions to its soaking pit and blooming mill units at its Riverside works. Three new soaking pits will be erected. An additional heating capacity of 7200 tons of ingots per month will be provided and a corresponding increase in semi-finished steel. A new normalizing furnace, electrically operated, will be erected, with which the company will be able to increase its finished sheet output 2000 tons per month.

Concrete Bar Sales Expand

The Concrete Reinforcing Steel Institute reports that bars sold and shipped in the first five months of 1928 were 12 per cent above the tonnage in the corresponding period in 1927 and 4 per cent above the same period in 1926.

ESTABLISHED 1855

For More Economic Distribution

ON nothing have men in the steel industry been more agreed, and for a long time agreed, than on the need of better methods for the distribution of their product. But admitting the weakness of a steel salesmanship that wins but small profit on an enormous investment is quite another thing from actually squaring selling policies with the familiar exhortations on the evils of price cutting.

The reasons for the divergence between the preachments of Gary, Schwab and others and the practice of steel company sales departments are well known. As commonly discussed they are an overbuilt steel industry, the Sherman act, preferred customers, unrestrained selfishness of some sellers, machinations of some purchasing departments, and too often a salesmanship that knows no higher skill than a lower price.

Complicated and baffling as the problem is, we need not assume that the steel industry will be continually defeated by it, even granting that Congressional relief through amendment of the Sherman act is more remote than some other remedies. Meanwhile the subject of better selling and distribution is having attention from various branches of the metal-working industries. One effort in particular has advanced to a point at which its results can be appraised and some measure taken of its adaptability to wider fields of manufacture and distribution. We refer to the plan under which the Bolt, Nut and Rivet Manufacturers' Association has been working with such success in the past two years in co-operation with the hardware and mill supply jobbers of the country.

Two days of last week were given to a largely attended conference in New York, as told at length on other pages, at which steps were taken to extend to other products commonly handled by distributors in iron, steel, heavy hardware and supply lines, the methods originally devised for the distribution of the product of the bolt, nut and rivet industry. Knowledge of these methods has been carried to every iron and steel jobbing center of the country by the officers of the bolt and nut association and has attracted attention widely through discussions at various trade conventions in the past eighteen months.

At a time when the cost of distribution is challenged in so many quarters, beginning with the farmer, as responsible for the high level of living costs, it is noteworthy that the bolt and nut manufacturers' plan meets the challenge by a claim of economies not only for manufacturers and distributors but for the ultimate consumer. That, indeed, is the test which every organized effort must meet, that sets out to change existing competitive lines. It is the test which separates good

from bad trusts, and is in no small part the basis on which the rule of reason is applied in the enforcement of the Sherman act. As was well suggested by Mr. Alexander, president of the National Industrial Conference Board, in his address before the distribution conference last week, the issues involved are to be judged not from the standpoint of the individual producer alone but from the broad viewpoint of national economy.

On the showing it has thus far made, the plan of the nut and bolt and rivet manufacturers has gone far toward commending itself both for its rescue of an industry from a profitless condition and for the economic benefit a stable market has conferred on both distributor and consumer.

Hoover As An Engineer

WASHINGTON was a land surveyor. We doubt if he should be characterized as an engineer. If Herbert Hoover should be elected to the presidency, it may correctly be said that he would be the first engineer to be installed in that great office. Also, he would be the first economist and the first administrator of business affairs, for the great engineer, especially the great mining engineer, is almost bound to be those things as well as just engineer. Hoover's professional colleagues tell us that they regard him as a great engineer. Indeed there is ample evidence that they so regarded him more than 15 years ago, long before his name had popular recognition.

After some early experience in the United States, Hoover became associated with the great engineering-managerial house of Bewick, Moreing & Co., and worked for it in China during some stirring times and later in Australia when the gold mines of Kalgoorlie were being developed. He worked for it so efficiently that very soon he was invited to become a member of the firm, and while still a very young man he had earned a competency for himself. He played a great part in directing the operation of the whole group of gold mines at Kalgoorlie; and later, turning his attention to zinc, he was most instrumental in organizing the production of zinc ore at Broken Hill in Australia and in developing the great Bawdwin mine in Burma.

But while becoming thus an administrator and financier Hoover never relaxed from the purely professional part of his engineering, and in that interest he gave freely of himself to his professional colleagues and to the public, this being distinct from what he gave to the stockholders in his companies. He was the first to clarify the minds of mining engineers on the correct principles of valuing mines, formulating what came to be known as the Hoover laws, the Hoover actuarial tables, etc. This, moreover, directed the collective en-

gineering mind into economic thought, for the natural corollary of the principle that a mine is the more valuable the more quickly it is liquidated is the question of the probable price for its product.

Hoover next found time to write a treatise on the principles of mining, published in 1909, in which he described and discussed the technical methods of extracting ore from the ground. This was immediately pronounced a classic of technical literature, and after 20 years still is so viewed and so consulted. It was of the kind of technical treatises that live.

Even better known, however, became his translation of Agricola's *De Re Metallica*, in which Mrs. Hoover collaborated. This was the first of the world's treatises on mining and metallurgy and its German author wrote it in Latin, as was the custom of scientists of the 16th century. Academic scholars had tried time and again to translate this great work and had made sorry messes of their jobs, for the alchemists and their successors knew of many things that the Romans did not, and in writing of them in Latin they were obliged to coin words that were not to be found in any lexicons. Thus the scholars could but guess their meaning, and being ignorant of the technology they often guessed wrong, sometimes ludicrously.

With Mrs. Hoover as the classicist and Herbert Hoover as the technologist there was no guessing, but correct inference out of knowledge of what the author was talking about. Along with this Hoover explained and discussed matters in voluminous annotations which if collected would have constituted in themselves a treatise on the history and philosophy of mining. For this great translation the academic world bowed in respect and to Mr. and Mrs. Hoover the Mining and Metallurgical Society of America awarded its gold medal.

All of these things happened previous to the Great War. In the upheaval of August, 1914, many Americans found themselves stranded in London. Hoover, who was in London at that time, organized his professional colleagues to finance their fellow citizens and get them home. Probably no one but Hoover would have thought of undertaking such a thing. When he appealed to his fellow mining engineers he knew what he was doing. Most mining engineers have been travelers to remote places. At one time or another they have lost their baggage or their purses, or have encountered all imaginable difficulties that they have had to overcome. The predicament of thousands of helpless Americans in Europe was to them only old things multiplied, and they unraveled the tangle with the expedition that everybody knew 14 years ago but has now forgotten.

After that the career of Herbert Hoover and his uniform efficiency became matters of general knowledge. Any publicist can write of them. We are writing of Hoover the engineer.

The Vice-Presidency

WITH the end of the Coolidge administration there will have been 35 presidential terms in the United States and that great office will have been held by 29 men. Of these six died in office. Of the 29 presidents three were elected directly to the presidency from the vice-presidency. These statistics show how important the vice-presidency has been in our political system. Nearly one-third of our presidents have previously held the office of vice-president, three of them having suc-

ceeded by election and six following the death of the president. Of the latter, two retained the presidency by subsequent election. It may be deduced from this that five out of nine of the vice-presidents who succeeded to the presidency were wanted by the people. Of the other four three were colorless, but one was threatened with impeachment, wherefore he was not colorless. The historical record makes it clear that the vice-presidency is not a nomination lightly to be considered.

In recent practice, a president having been nominated after a factional fight, the nomination for the vice-presidency has been determined on grounds of political expediency in respect to vote-getting, and this has often resulted in the secondary nominee being more or less out of sympathy with his principal. Thus, Mr. Dawes as vice-president has been distinctly out of sympathy with Mr. Coolidge. Often, also, the vice-presidential nominee has been of inferior standing, a man whom the people would never think of putting up for president in the first instance. Sometimes the vice-presidential nomination has been careless and accidental. Of course, we must not overlook that such casualness gave us Roosevelt and Coolidge.

The last is really the important thing. Our national experience, during 140 years, has demonstrated that the possibility of the vice-president becoming president by accident is one out of five. We ought therefore to use great care in selecting the man for that office. And if we are minded to elect to the presidency a man who is an exponent of certain policies, his understudy ought logically to represent the same policies.

Seasonal Steel Prospects

AT this mid-year time it is important to allow for a seasonal trend in gaging the favorableness of steel tonnage prospects. It is nothing to predict that steel production will be smaller in the second half of this year than in the first half, for that is normal; hence unfavorable deductions should not be drawn from the prospect, unless it is unusually unfavorable, which is not the case.

In only one of the nine years that have elapsed since the war was more steel produced in the second half than in the first half. That exceptional year was 1922, a year of recovery from severe depression. The other eight years showed an average decline of 10¾ per cent in production from the first half to the second half, and the normal second half has one more working day than the first half. In rate of production the division is a 53-47 division, which may reasonably be taken as standard.

Actual half yearly production of steel ingots is shown in the table below. In certain years round figures are given for the first half because the official monthly figures were not complete. The totals are official:

Steel Ingot Production—Gross Tons			
	First Half	Second Half	Total
1919	17,500,000	16,194,795	33,694,795
1920	20,825,000	20,056,392	40,881,392
1921	10,320,000	8,904,084	19,224,084
1922	15,875,000	18,693,418	34,568,418
1923	23,326,965	20,158,700	43,485,665
1924	19,737,034	17,074,123	36,811,157
1925	22,383,071	21,757,667	44,140,738
1926	24,153,809	22,732,396	46,936,205
1927	24,000,000	19,776,717	43,776,717

Production in the first half of this year was probably above 24,500,000 tons, but there was the benefit of an

extra working day, while the second half will be short one working day.

History does not suggest that steel prices are lower in second halves than first halves on account of the difference in tonnage. A convenient and simple reference is the table on page 113 of THE IRON AGE annual number, Jan. 5, 1928, showing the monthly average composite price of finished steel. From the figures no such trend can be seen. Allowance of course must be made for the fact that there were generally falling prices after 1923 until December of last year.

It will be observed from the above table that 1927 showed a larger drop from first half to second half than any other year. This year has made a good start by passing the first half of last year and has retained the lead to date. It will be particularly easy for the second half of this year to compare favorably with the second half of last year. It would require only a 67 per cent operating rate to make the same tonnage. That is under the percentage rates reported for the second half of last year, but the capacity rating is raised $2\frac{1}{2}$ per cent for this year.

Just why there should naturally be lighter production in the second half of a year is not fully explained. Rails are an influence, the northern roads requiring delivery during the first half of the year for their season's replacements; and a corresponding principle probably applies in mild degree in many activities.

Demands for Better Tonnage Steel

JUST 100 years ago the Institution of Civil Engineers was incorporated in Great Britain by royal charter, and during the first week of last month meetings were held to commemorate the occasion. There was a wide diversity in the subjects considered, since the scope of the institution includes nearly all branches of engineering. Progress was recounted in reinforced concrete construction, railroads, electric traction, shipbuilding, fuel economy, boiler construction, power transmission, domestic heating—many of these subjects being quite outside the field of civil engineering as understood in America.

Even the most rapid glance through the "introductory notes" and the reported discussion cannot fail to reveal the all-important place iron, steel, and the alloys have had in this diverse engineering development. Of course, many branches of applied science which were non-existent and undreamed of a hundred years ago have grown into such large proportions as to affect the daily life of every citizen. Many revolutionary changes dependent upon a cheap and plentiful supply of uniform steel had to wait perforce until the open-hearth process was perfected. Other progress, as in electricity, leaned more heavily on copper. But one cannot help realizing, when he stops to think of the century's amazing development of machinery and fixed structures, that it could not have gone very far except for the metallurgist.

Inspiring though these thoughts may be, it is more important to look ahead. If past progress has been due to sound metal, that of the future will as certainly require continual improvement in quality. Railroad engineers are asking a longer rail which will safely bear the heavy wheel loads without rapid wear. Bridge

and structural engineers want a mild steel that can be stressed to a higher safe figure, and above all one that does not rust so fast. Shipbuilders say they could reduce the weight of a hull 15 per cent if they were furnished plates and beams with a minimum proportional limit of 38,000 pounds per square inch. Steam engineers now ask metallurgists for an entirely new set of metals for the high superheat plants that must be installed if steam is to compete with internal combustion engines. The needs of aircraft for special alloys are well known.

But whereas the demands for special qualities were recently confined to products of small tonnage, the requirements of the immediate future will be for higher grades of strictly "tonnage" steel. Rails have to be better. Mild steel must corrode less. Ship steel must be stronger. Sheet steel must be smoother and take more punishment. Steel is no longer 'just steel. More and more of the common or garden varieties will be bought with an intelligent eye to the most service per dollar.

Fortunately the way of improvement in many directions is well known. We know how intimately the choice of the raw material and the melting practice affect the toughness of steel rails. We know how a little copper in steel improves the resistance to atmospheric corrosion, and how a little extra manganese increases the elastic limit remarkably. We know how important ingot practice, soaking, and rolling mill drafts and temperatures are to surface finish and uniform physical properties. All such considerations will have increasing weight in the tonnage mill as the months go by. Research will discover other ways to improve quality.

It would be the greatest error to depend too much on steels as standardized at present. The Portland cement industry has been rudely awakened from such a state. "Cement is cement, take it or leave it," they said, and, until people started taking wholly unstandardized products which set hard and strong in hours instead of days and did not crumble in alkaline ground waters, progress in quality was slow—in fact unnecessary. By this recent development concrete, the principal competitor of steel for bridges and structures, has taken a new lease on life. Steel cannot delay an equivalent or greater improvement if it is to stave off competition from many sides—if it is to provide for the continued advance in engineering and construction.

The Iron Age in a New Garb

WE begin this, the 122d volume of THE IRON AGE, with a moving of the pages of reading matter close to the front of each issue, and with changes in both the size and appearance of the printed page. By the departure in size, we relinquish our years-long adherence to the golden mean in page proportions but we put into practice what we have preached generally regarding standardization, as these pages now conform to one of the standards that have come into being among periodicals. Otherwise the new arrangement aims to continue, if not to enhance, readability, and what further modifications may be made will look to seeking at all times reader convenience.

This Issue in Brief

Can the management methods that are making money for the large manufacturers be used successfully by smaller plants? Yes, says engineer, for the savings more than equal the cost of the additional overhead.—Page 1.

* * *

Manufacturing costs must be reduced 10 per cent each year. Machinery builder sets this as the minimum, but has always exceeded it. First requisite in reducing costs is intimate knowledge of costs. The second requisite is that attitude of mind which regards all processes as temporary, to be tolerated only until a better way is found.—Page 6.

* * *

Predicts increase in output of Bessemer steel. Its free-machining and welding properties will not only enable Bessemer steel to hold its own, but will enable it to improve its position, metallurgist believes.—Page 11.

* * *

Too much buying is done without adequate investigation, says machinery builder. Many buyers forget that conditions are constantly changing, and when they send an inquiry to only one supplier, they fail to profit by gains which may have been made.—Page 7.

* * *

Is the cost of buying too high? If it costs too much to interview 50 salesmen, why not select six suppliers who qualify completely, and place the order with one of those six? asks editor. Purchaser should demand firm bids, and shun the two-bidder. Bidders baited by unfair buyers should hold post-mortem comparison of bids, by submitting bids on closed business to their trade associations for report.—Page 11.

* * *

Heat-treating different portions of same part differently is common practice with Ford. In one case a furnace with three heat zones is used, so that varying degrees of hardness may be imparted to different portions of the rear axle shaft.—Page 13.

When buying anti-friction bearings be sure you select the right bearing and apply it properly. Otherwise, unsatisfactory service and high maintenance cost will result.—Page 31.

* * *

Systematic routing and scheduling of work reduces machining time 46 per cent in moderate-sized shop. Formerly foremen were entangled in a mass of details—hunting jobs for the men, hunting drawings, etc. Now they devote their time to supervising operations, with the result that the machine hours on a certain job have been cut from 3640 to 1950.—Page 4.

* * *

If you are performing a certain operation today the same way as five years ago, the chances are that you are behind the times. Industrial history shows that most manufacturing processes are obsolete within five years, says machinery builder. The successful firm is that which studies processes closely and beats obsolescence.—Page 7.

* * *

Are you saddling manufacturing executives with "paper work" which could be done by clerks? In many plants foremen and other department heads are unable to give full time to supervision and study of cost-cutting methods, because of the records they are obliged to maintain.—Page 1.

* * *

Purchasing engineer is the "lookout man" for the organization. He functions as the preliminary research man, for people with something new to offer come to him. Best results are obtained by considering each purchase separately from two angles, commercial and technical.—Page 5.

* * *

Industry suffers from a shortage of skilled labor, while unemployment exists among unskilled workers, says apprentice supervisor. America is not training sufficient skilled labor to supply its needs. Apprentice training is the obvious answer to the problem.—Page 25.

With security yields below interest rates, further liquidation of security prices is to be expected, says Dr. Haney. Yield on common stocks is now only 4.33 per cent, and there are no prospects for a substantial increase in industrial earnings.—Page 26.

* * *

On what portion of your sales do you lose money? Taking business as a whole, 80 per cent of sales expense is producing less than 20 per cent of the volume, says association head. Losses on high-cost business must be paid out of the profits on the 80 per cent low-cost volume.—Page 16.

* * *

Cooperation puts an entire industry on a profitable basis. Bolt, nut and rivet manufacturers are furnished with a common cost system; quantity buyers are listed, and small business is left to jobbers; package sizes have been reduced from 168 to 18. No price agreements have been made, but prices have been stabilized. As a result, the entire industry has gone from red ink to black.—Page 16.

* * *

Copper-bearing iron and steel sheets corrode as quickly as do copper-free sheets when submerged in water. Tests by A. S. T. M. reveal that copper content does not retard corrosion in fresh water, brackish water and mine water.—Page 29.

* * *

Daily output of pig iron declined 3 per cent in June. Average production was 102,710 tons per day, against 105,931 in May. On July 1 there were 190 furnaces in blast, eight less than the June 1 total.—Page 35.

* * *

Quantity buyers should not get lower prices, says C. M. Schwab. "It is the little fellow," he declared, "who is entitled to better prices if anyone is, because the large buyer has chances which the small one has not."—Page 18.

Iron and Steel Markets

Large Steel Orders for Pipe Lines

Total of 175,000 Tons Placed—Steel Shipping Orders Hold
Up Despite Holiday Interruption in Operations—
Valley Basic Iron Stronger

THE danger of preconceptions regarding the course of steel business has been given fresh emphasis. Independence Day week, as is customary, will see a reduction of activity, but it will be reflected in plant operations rather than in demand. Mills have less contract tonnage than at the opening of the second quarter, but the volume of shipping orders in both releases against past commitments and short-term purchases is holding up well.

At Chicago, bookings for the week were the fourth largest of the year and backlogs increased in virtually all lines except rails and sheets. Present demand there, it is believed, will sustain ingot output at 80 per cent of capacity, following recent declines largely attributed to diminishing rail specifications.

In other districts, buying is more cautious, but without materially reducing the total tonnage reaching the mills for rolling. Releases against expiring contracts for plates, shapes and bars at 1.85c., Pittsburgh, will cover the needs of many consumers through July. On the other hand, some contract buyers did not fully exercise their second quarter options, while those who have placed third quarter contracts at the advanced quotation of 1.90c. evidently expect a downward adjustment of invoice prices in case the market again recedes.

Mill operations are less dependent than formerly on large individual orders, but the maturing of several pipe lines after months of negotiation has added a substantial tonnage to the large volume of business coming from miscellaneous sources, and from the automotive, implement, canning and building industries. For four pipe lines a total of 175,000 tons of steel was ordered during the week, following the placing of 50,000 tons two weeks ago.

The automotive industry continues to take a large tonnage of steel and, as yet, shows no signs of a sharp summer slump. June specifications from motor car builders were only slightly smaller than in May and, while some automobile companies are reducing operations, others are maintaining output without change. The Chevrolet Motor Co. has announced a minimum production schedule of 100,000 cars monthly for the current quarter.

Farm equipment makers, having completed inventories, have resumed full production, with sizable schedules arranged for many weeks to come.

Sustained building activity is indicated by the addition of nearly 30,000 tons to the large amount of structural steel work pending, and by awards during the week of 42,000 tons.

Tin plate mills are well supplied with specifications, but will not be embarrassed by the holiday interruption in operations, since rainy weather has been holding back canning.

Pig iron production in June, estimated from telegraphic reports to THE IRON AGE, averaged 102,710 tons a day, a decline of 3 per cent from the May rate. There was a net loss of eight active blast furnaces during the month. Output for the first half of the year, estimated at 18,520,200 tons, was the smallest since 1924, in sharp contrast with steel ingot production, which will undoubtedly prove a half-year record.

Pig iron prices show no signs of strength except in the Valleys, where there has been another recovery in basic iron to \$16, furnace, or an advance of 65c. over the recent minimum. Foundry melt, on the average, is holding its own, although shipments of pig iron to the automotive industry are expected to decline this month, possibly as much as 20 per cent compared with June.

Scrap markets continue to weaken. Heavy melting steel at Pittsburgh has declined 25c. a ton for the third time in three weeks. The same grade has dropped 25c. a ton at Chicago and St. Louis.

The Pennsylvania Railroad has ordered 12,000 tons of track supplies. Leading makers of track spikes have announced an extra of 25c. per 100 lb. for less-than-car-load lots in both large and small sizes.

The growth of steel consumption for building purposes is shown by shipments of concrete bars in the first five months of this year, as reported by the Concrete Reinforcing Steel Institute. The total was 12 per cent larger than in the corresponding period last year and 4 per cent greater than in 1926.

The larger domestic producers of gravel fluorspar have announced an advance of \$1 a ton to \$17 a net ton, mines.

Recovering slightly from its low point, THE IRON AGE composite pig iron price is now \$17.25, against \$17.21 last week. The finished steel composite remains at 2.341c. a lb. for the fifth week.

Pittsburgh

Steel Business Holds Up Better Than Usual at This Time of Year—Large Pipe Line Orders

PITTSBURGH, July 2.—The slowing down in the steel industry common to Fourth of July week is in plant operations rather than in demand. Few steel makers yet detect the recession in consumptive requirements usual at this time of the year, the vital difference between the opening of the second quarter and the start of this quarter being that order books run lighter in contracts and heavier in specified tonnage, and the latter is much the more satisfactory condition so long as consumption holds up. A frequent expression as to the state of trade is that it is much better than it ordinarily is at this time of the year. Tin plate has never given a better account of itself than it is doing just now and additional pipe line orders have brought the total placed in the past two weeks to more than 200,000 tons. Locally, structural steel business does not reach sizable proportions, but in the country at large it is highly satisfactory.

In spite of the introduction of new models and the cessation of production of old models by several automobile builders, the demand for steel from that direction is holding up remarkably well. Last month surprised manufacturers of most finished steel products in the volume of the production and shipments of cars.

There is little new as to prices, except that sheets appear to have reached bottom and that makers of

bars, plates and shapes are more earnest in their endeavors to establish 1.90c., base Pittsburgh, as the third quarter contract price.

Primary materials still are weak. It is several years since heavy melting steel scrap was priced as low as it has been sold in the past week. The pig iron market is inactive. Coal is very dull and prices are of buyers' making, since producers lacking Lake cargo business are finding it difficult

to market their outputs. Cheap raw materials are somewhat of a drag on steel prices.

Pig Iron.—Interest in the market on the part of melters is limited, and the business of the past week has not amounted to much. The Westinghouse Electric & Mfg. Co. is still taking bids against its inquiry for last half requirements of its local and Cleveland foundries. The tonnage wanted is not specified, but it is assumed it will be of fair size and it is the only important business now pending. Small lots of foundry iron are moving. Some producers report sales at \$17, Valley furnace, for the base grade, but as others are taking business at \$16.75 and have gone as low as \$16.50 in competitive territory, it is assumed that \$17 prevails only at destinations to which the freight rate is lower than that into the Pittsburgh district. Important users of basic iron appear to be covered against their immediate requirements and interest in Bessemer and malleable iron is small. Low phosphorus iron is selling fairly well at around \$28.25, delivered. W. P. Snyder & Co. make the average price of basic iron from Valley furnaces in June as \$15.43,

compared with \$16.25 in May, and of Bessemer \$17, compared with \$17.29 the month before.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17 00
Gray forge	\$16.25 to 16.50
No. 2 foundry.....	16.75
No. 3 foundry.....	16.25 to 16.50
Malleable	17.00
Low phos., copper free...	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Ferroalloys.—Ferromanganese is firmly held at \$105, Atlantic seaboard, for both the domestic and the imported product, but almost all of the recent shipments to consumers and those that they will receive this month carry a price of \$100. Small consumers who depend upon the spot market have paid the present price, but users who were under contract for the first half of the year had until last Saturday to specify against them and have at least this month's coverage at the lower figure. Consumers of spiegeleisen are specifying well against contract commitments, and shipments of ferrosilicon are in fair volume.

Semi-Finished Steel.—To get orders for sheet bars makers here now find it necessary to make a price of \$32, f.o.b. Pittsburgh, as an outside producer is supplying a Pittsburgh district mill which has a freight rate of a little more than \$1 a ton from Pittsburgh, at \$33, delivered. Some makers still ask more, but at this juncture sales at more than \$32, f.o.b. Pittsburgh, are difficult, and it is probable that third quarter contracts will carry that price, which represents a drop of \$2 a ton from the open, although flexible, quotation of the first half of the year. Billets and slabs are fairly firm, with makers disposed to resist the pressure of buyers against prices. On wire rods, \$42, base Pittsburgh, appears to be all that can be done. Forging quality billets and blooms are selling at \$38, base.

Bars, Plates and Shapes.—Makers in this area seem to be more determined in their adherence to 1.90c., Pittsburgh, as the basis of third quar-

ter contracts, but buyers are in no hurry to close for that period and a test of that price awaits some show of interest in supplies on their part. Cold-finished bar makers are not busy and appear to have good-sized stocks of hot-rolled bars, and much the same situation exists among bolt, nut and rivet makers. In view of the recent decline of \$2 a ton on cold-finished bars, there is some disposition on the part of other bar buyers to hold off to see whether the mills will insist on 1.90c. for hot-rolled bars. Much of the fabricated steel business in this area is in small projects. Plate prospects are brightened by a considerable tonnage of large outside-diameter pipe that is before the market, but they would be even brighter if there were signs of more railroad car business.

Rails and Track Supplies.—Leading makers have announced an extra of 25c. per 100 lb. for less than carload lots of both large and small spikes, with the shipment rather than the size of the order to govern. General business in rails and track supplies remains quiet.

Wire Products.—While total shipments of wire products for the first half of the year have been appreciably larger than in that period last year, the showing of June was unfavorable compared with June, 1927. The explanation is in the fact that, as the spring was backward and excessive rain followed it, the movement of goods into consumption, notably in the agricultural sections, has been limited. That, coupled with the heavy stocks accumulated to escape price advances, has left distributors with rather sizable supplies. Nails are commonly selling at \$2.55, base per keg, Pittsburgh, and plain wire at \$2.50, base per 100 lb., but there is some resistance to the latter price.

Tubular Goods.—Another good-sized line-pipe order has come to a Pittsburgh maker, this being one for 500 miles of 10-in. pipe, believed to be for the Atlantic Refining Pipe Lines Co., to run from Midland, Tex., to Atreco, the Gulf port of the At-

lantic Refining Co. The purchase covers approximately 50,000 tons and makes a total of 100,000 tons that has been placed with local makers in the past two weeks. A Youngstown maker will furnish 300 miles of 16-in., approximately 42,000 tons, for a Louisiana gas line and the same producer is reported to have taken 136 miles of 20-in. for the gas line for the Inland Gas Corporation, an interest of the American Rolling Mill Co., which is to pipe natural gas from the Kentucky field to the Ashland, Ky., plant of the latter. Buttwelded pipe for building and construction work is moving steadily, but not much activity is seen in lapwelded pipe for oil well development, although the demand from the Seminole field is said to be a little more active.

Tin Plate.—Observance of the Fourth of July will mean a reduction of mill operating schedules this week by as much as one-third; the day is a regular steel mill holiday and most manufacturers are dropping one turn on July 3 and on July 5, besides the three on the holiday itself. All makers are well supplied with specifications on contracts but can afford a breathing spell in output, since the rainy weather is holding the crops back and the pack is also being retarded. The sale of bottled beverages also has been restricted by the weather, and this affects the use of caps, which are made of tin plate.

Cold-Finished Steel Bars and Shafting.—Business has not been helped by the recent reduction of \$2 a ton in prices; rather, it has made buyers a little more conservative, because there were no signs of real weakness prior to the cut.

Hot-Rolled Flats.—Business in strips is good enough, but the price situation remains very unsatisfactory, with what are regarded as regular quotations applying only on small-lot business. Net prices continue to be made on the sizable tonnages and, translated back to a base price, produce very low figures. The extras over base evidently are profitable on

Chromium Nickel Vanadium	1.50	4.15
Carbon Vanadium	0.95	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00

11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Carbon, 0.30% to 0.40%, base	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

the wider material, in view of the price cuts that are being made on stock 6 in. wide or wider. Hoops and bands are firmer in price than strips.

Cold-Rolled Strips.—Demand has fallen off much less than it usually does at this time of the year, and some makers find June orders ahead of those for May. Prices, however, are dominated by the hot-rolled strip market, and most business carries the minimum quotation of 3c., base, or 2.75c. for lots of 3 tons or more.

Fluorspar.—The larger domestic producers have announced an advance of \$1 per ton in gravel spar to \$17 per net ton at mines. The smaller producers have not acted, and such business as has been done lately has been at \$16. Most users are covered for the next few months and not much new business is in sight, unless this advance prompts some buying.

Sheets.—Mill operating schedules are lower this week by as much as one-third, but it is the observance of the Fourth of July, one of the regular steel industry holidays, rather than a lack of business, that is responsible. There is no evidence yet of the recession in consumptive requirements common to this time of the year and orders, while individually small and for very prompt shipment, are quite numerous. Prices are steadier at least to the extent that they are no lower now than they were a week ago.

Bolts, Nuts and Rivets.—Buyers have been prompt in entering contracts for third quarter. Specifications are constant, but are kept well within actual requirements and a 50 per cent operation of productive capacity is sufficient to supply the demand.

Coke and Coal.—The market still is extremely dull. While a little Lake cargo coal business has developed, it is not nearly the size it was expected to be, and with demands from other directions also light, prices still are

very much in the buyers' favor. There is only a limited demand for spot furnace coke and prices hold chiefly because offerings are light. So many foundries are under contract that interest in spot offering amounts to little.

Old Material.—Dealers are more anxious to book orders than melters are to place them and, while the market has been fairly active in the past week, it is largely because dealers have made prices that have induced consumers to take supplies. Two steel companies in this district have bought No. 1 heavy melting steel at \$14, one of them getting at least 10,000 tons at that figure, which sets another new low mark for the year. Weakness in the lighter grades is unrelieved, with machine shop turnings still offered at \$9 and blast furnace grades no longer quotable at more than \$10. Heavy breakable cast scrap has been sold at \$12. Compressed sheet scrap is not at all plentiful and is virtually at par in price with heavy melting steel.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:
Heavy melting steel.....\$13.75 to \$14.25
Scrap rails 13.75 to 14.00
Compressed sheet steel.... 13.50 to 14.00
Bundled sheets, sides and ends 13.00 to 13.50
Cast iron carwheels..... 14.00 to 14.50
Sheets bar crops, ordinary 14.00 to 14.50
Heavy breakable cast..... 12.00 to 12.50
No. 2 railroad wrought.... 14.00 to 14.25
Heavy steel axle turnings. 12.50 to 13.00
Machine shop turnings... 9.00

Acid Open-Hearth Grades:
Railr. knuckles and couplers 15.00 to 15.50
Railr. coil and leaf springs 15.00 to 15.50
Rolled steel wheels..... 15.00 to 15.50
Low phos. billet and bloom ends 19.00 to 19.50
Low phos., mill plate.... 17.50 to 18.00
Low phos., light grade.... 16.50 to 17.00
Low phos. sheet bar crops. 17.50 to 18.00
Hvy. steel axle turnings.. 12.50 to 13.00

Electric Furnace Grades:
Low phos. punchings.... 16.50 to 17.00
Hvy. steel axle turnings.. 12.50 to 13.00

Blast Furnace Grades:
Short shov'l'g steel turnings 10.00
Short mixed borings and turnings 10.00
Cast iron borings..... 10.00
No. 2 busheling..... 8.50 to 9.00

Rolling Mill Grades:
Steel car axles..... 18.00 to 18.50
No. 1 railroad wrought... 10.50 to 11.00
Sheet bar crops..... 16.00 to 16.50

Cupola Grades:
No. 1 cast..... 14.25 to 14.50
Rails 3 ft. and under.... 15.50 to 16.00

Malleable Grades:
Railroad 13.75 to 14.00
Industrial 13.25 to 13.50
Agricultural 12.75 to 13.00

Heavy Reduction in Pig Iron Imports

Imports of pig iron in May are reported by the Department of Commerce as 9732 gross tons. This is less than half the April figure of 20,845 tons and represents a reduction of nearly 44 per cent from the 16,664 tons of May, 1927.

In spite of this falling off, however, the total for the first five months, at 63,496 tons, is more than 35 per cent above the corresponding figure last year. The increase has been accounted for by a gain of more than 21,000 tons in receipts from

Great Britain. India has sent a slightly larger tonnage, but shipments from Germany have fallen off to almost nothing and there has been a reduction in receipts from the Netherlands.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT (In Gross Tons)

Iron Ore Imports Hold Well

Imports of iron ore in May are reported by the Department of Commerce at 211,270 gross tons. This is more than 5½ per cent below the April imports of 224,841 tons but represents a gain of 30 per cent over the March arrival of 162,654 tons. It is 14 per cent higher than the incoming tonnage a year ago, at 186,208 tons in May.

For the first five months of the years imports have been about 3 per cent higher than last year. Heavy gains are reported in incoming tonnages from Chile, Canada and French Africa, while there was a sharp reduction in imports from Cuba and Sweden. More than half of the total for the five months in each year came from Chile. For May, 1928, Chile furnished more than two-thirds of the total.

Electric Power Production in United States in 1927

Production of electric power by public utility plants in the United States in 1927 is placed by the Geological Survey at 80,205,474,000 kwhr. Of this amount 50,336,466,000 was produced by the combustion of fuels and 29,875,008,000 by water-power. Fuels produced 62.8 per cent of the total. Consumption of fuels included 41,888,497 net tons of coal, 6,782,192 bbl. of oil, 62,919,197,000 cu. ft. of natural gas, and a certain amount of wood and other combustibles.

There were 1820 operating companies in the United States, Jan. 1, 1928, having a total of 3740 plants and an aggregate generator capacity of 27,690,841 kw.

Chicago

First Half Steel Shipments Largest in Many Years—Ingot Output Now at 80 Per Cent

CHICAGO, July 2.—Shipments of steel by Chicago producers in the first six months of this year totaled the largest for a like period in many years and exceeded the corresponding period of 1927 by 15 per cent. Following a dull November and December, orders bulked large in January, while March and May were record months. June shipments were not as heavy as those in May, and the tendency is still downward, though at a slower pace than is usually to be expected at this time of year. Ingot output, after dropping for three consecutive weeks, is now at 80 per cent of capacity. The general demand for heavy tonnage steel products is well sustained, and it therefore appears that the slower rate of ingot output is largely chargeable to dwindling shipments of rails.

Chicago producers are naming 2c. as the third quarter price on shapes, plates and bars. Although the practice of spot purchasing is more widespread than earlier in the year, there is an increasing interest in advance buying, and sales for the week are the fourth largest this year and exceed those of any seven-day period since the middle of February. Backlogs are heavier in practically all commodities except rails and sheets. Specifications are fully equal to shipments.

Bids have been submitted at Denver, Colo., on 12,000 tons of steel pipe.

No. 6 furnace has been put out at Gary, leaving 25 active steel works stacks out of 36 in the district.

Pig Iron.—Price levels to the east of Chicago are of interest to local buyers of pig iron, who are uncertain as to the general trend of business and the effect of neighboring markets on Chicago quotations. Shading of differentials on high silicon iron is being practised by a few sellers and distress lots of iron brought in by boat can be had at prices below the Chicago market level. A user in western Michigan has taken 700 tons of 8 per cent silvery at the market. A melter in Illinois will buy 100 tons of the 7 per cent grade. Bargain lots of charcoal iron are still to be had at well below the quoted price of \$24, furnace.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	\$18.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	18.50
Malleable, not over 2.25 sil.	18.00
High phosphorus	18.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	21.51
So'th'n No. 2 (barge and rail)	21.01
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15%	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Local dealers are using \$33, Hazard, Pa., as the basis for quoting on 19 to 21 per cent spiegeleisen, but the market is slow and no sales have been made. Specifications for ferrosilicon and ferromanganese are of moderate size.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Following several weeks in which oil producers showed little interest in added storage facilities, there is now before the steel trade

fully 14,000 tons of tank plates for three oil companies in the Southwest. In the local market both sales and deliveries of plates are of moderate size. Demand from the general manufacturing trade is steady, and fabricators are taking normal tonnages for this time of the year. But railroad car builders, who have not been forced to extend themselves since the turn of the year, are operating at less than 40 per cent of capacity on orders against which practically full specifications already have been entered at the mills. The outlook in the railroad equipment market is not promising. The Chicago & Eastern Illinois is asking for prices on 100 40-ft. automobile cars. This is essentially a revival of an old inquiry, which originally was for 500 cars. Word is being passed around that the Missouri-Kansas-Texas will place orders for 19 passenger and baggage cars next week. Action is still awaited on 10 air dump cars and 250 gondola bodies for the Rock Island. The price situation in this district has been somewhat clarified by the action of one producer in announcing 2c. per lb., base Chicago, as the basis for third quarter contracts and spot orders. That there is still some doubt as to the course to follow is indicated by the fact that other sellers are delaying action until they are surer of the general trend. In the absence of heavy tonnage business, it is believed by some that 2c., Chicago, can be held for the time being.

Mill prices on plates, per lb.: 2c., base Chicago.

Structural Material.—A feature of this market is the tonnage required for bridge work, both for railroads and State highways. In addition to the large project announced a few days ago at Louisville, Ky., there is a railroad bridge at Melville, La., that will take 4200 tons. Orders have been placed for 1200 tons of steel for a bridge across the Missouri River, 1000 tons for a bridge at Menominee, Wis., and 500 tons for a span at Garland City, Ark. At Chicago, it is reported that 3500 tons for the Austin High School has been awarded and that 2200 tons has been placed for a motor car assembly plant at Kansas City, Mo. Some fabricators in Chicago are finding it advisable to increase their efforts to obtain contracts, though the situation here as a whole is quite fav-

orable for this time of the year. Indiana shops are well supplied with work and the same is true to the southwest. In Nebraska, however, 70 per cent of shop capacity appears to be a fair estimate of output. Weather conditions in the last 10 days have not been favorable to outdoor construction and building programs have been set back. Prices for plain material are steady at 2c., Chicago. Open announcement of this quotation for third quarter business has been made by only one producer.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Bolts, Nuts and Rivets.—Users of these commodities, having found stocks inadequate for early July consumption, are issuing larger specifications, and it now seems assured that production of bolts, nuts and rivets will be continued at close to 65 per cent of capacity. It is noteworthy that railroads are in need of larger quantities.

Reinforcing Bars.—Large tonnages of rail steel bars are quoted at 2c. per lb., and billet concrete bars bring 2.30c., Chicago warehouse. Small lettings are numerous, and, because of the extra amount of labor needed to complete them, shops have an air of activity that is not reflected in the volume of shipments. The Harmon Sports Arena, Chicago, requiring 450 tons of bars, is out for figures, and an old project, Sheridan Towers apartment building, Chicago, in which 450 tons will be used, has been revived and final action may be taken on the contract in a few days. Contracts and fresh inquiries are given on page 59.

Bars.—Improvement is noted in the demand for soft steel bars from miscellaneous sources. Deliveries run from three to four weeks, depending on the range of sizes in individual orders and rolling schedules at mills. Accessory manufacturers who cater to the automobile industry have not diminished their pace and forgers are busy. Agricultural implement manufacturers, having passed the inventory period, have swung into full production, with sizable schedules arranged for many weeks to come. Mild steel bar output is well above the current ingot rate, which stands close to 80 per cent of capacity. Prices in Chicago are 2c. per lb., and some forward contracting has been done at that figure. For the third consecutive week new business and specifications for iron bars have been well above the average week so far this year. Much of this tonnage comes from miscellaneous sources. Prices are steady at 2c., Chicago. Though reports are current that several manufacturers of automobiles have cut output, they are evidently builders who do not depend on this district for steel. In alloy steel bars, shipments and new orders for the past week compare favorably with the average over the last month. Buyers of rail steel bars are taking smaller quantities and are demanding prompt shipment. New buying is in fair total

volume but does not equal mill output, which is at capacity. Stocks in the hands of producers are unbalanced and small, following a heavy run on steel fence posts and hard steel reinforcing bars. Prices are steady at 1.85c., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Wire Products.—Demand is remarkably steady when it is considered that the seventh month of the year is at hand. Trade from manufacturing consumers is well sustained, and mill operations remain close to 65 per cent of capacity. Orders placed by the railroads are of fair size, having varied little in many weeks. Demand for field fencing in rural districts is lighter. Jobbers in the South are finding business quiet. Distributors in the Middle West report a steady demand, and trade in the Northwest is much improved. Although rains have improved the crop outlook in some parts of the country, in some sections an excess of water is interfering with cultivation of the fields. Mill prices for wire and wire products are given on page 43.

Rails and Track Supplies.—Outstanding among track supply orders this week is one placed by the Pennsylvania Railroad. In all, 12,000 tons was purchased by that line, though it is not known here how the tonnage was distributed. Miscellaneous orders from Western railroads total 5000 tons. Shipments of track accessories are steady, and the rate of production has not changed for over four weeks. The heavy-section rail market is quiet. Rail output is close to 75 per cent of mill capacity. Several carload orders for light rails have been placed.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Coke.—Shipments of by-product foundry coke are a trifle lighter, reflecting the slower operations of foundries in this district. Second half contracting has gone forward steadily and prices are firm.

Warehouse Prices, f.o.b. Chicago

Old Material.—A consumer has purchased close to 1000 tons of No. 1 railroad heavy melting steel at \$12.75 a gross ton, delivered, a figure 25c. below the last purchase. Taken as a whole, this market is dragging and the trade is bearish. A few specialties are scarce and firm in price, but, for the most part, the supply of scrap is fully equal to, or even greater than, consumption. Larger buyers have fair stocks on hand and are well protected by contracts. The reaction in the market has brought prices obtained by railroads to the lowest point in months. The trade has sized up the slackening rate of steel production as an indication of dullness in the scrap market during the summer months.

Prices deliv'd consumers' yards, Chicago:
Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.25 to \$12.75
Shoveling steel.....	12.25 to 12.75
Frogs, switches and guards, cut apart, and misc. rails	13.25 to 13.75
Hydraul. compressed sheets	11.00 to 11.50
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'l'd steel carwheels.....	15.25 to 15.75
Railr'd tires, charg. box size.....	15.50 to 16.00
Railr'd leaf springs, cut apart.....	15.50 to 16.00

Acid Open-Hearth Grades:	
Steel couplers and knuckles	13.75 to 14.25
Coil springs.....	15.75 to 16.25

Electric Furnace Grades:	
Axle turnings.....	12.50 to 13.00
Low phos. punchings.....	14.50 to 15.00
Low phos. plate, 12 in. and under.....	14.00 to 14.50

Blast Furnace Grades:	
Axle turnings.....	9.50 to 10.00
Cast iron borings.....	9.00 to 9.50
Short shoveling turnings..	9.00 to 9.50
Machine shop turnings....	6.25 to 6.75

Rolling Mill Grades:	
Iron rails.....	13.50 to 14.00
Rerolling rails.....	14.75 to 15.25

Cupola Grades:	
Steel rails less than 3 ft..	15.50 to 16.00
Angle bars, steel.....	14.25 to 14.75
Cast iron carwheels.....	13.00 to 13.50

Malleable Grades:	
Railroad.....	12.50 to 13.00
Agricultural.....	11.50 to 12.00

Miscellaneous:	
*Relay'g rails, 56 to 60 lb.	23.00 to 25.00
*Relay'g rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angles and splice bars	14.00 to 14.50
Iron arch bars and transoms.....	19.50 to 20.00
Iron car axles.....	23.50 to 24.00
Steel car axles.....	15.50 to 16.00
No. 1 railroad wrought...	11.00 to 11.50
No. 2 railroad wrought...	11.00 to 11.50
No. 1 busheling.....	9.50 to 10.00
No. 2 busheling.....	5.75 to 6.25
Locomotive tires, smooth..	12.00 to 12.50
Pipes and flues.....	8.00 to 8.50

Cupola Grades:	
No. 1 machinery cast.....	13.50 to 14.00
No. 1 railroad cast.....	13.00 to 13.50
No. 1 agricultural cast.....	12.50 to 13.00
Stove plate.....	11.00 to 11.50
Grate bars.....	11.25 to 11.75
Brake shoes.....	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Cast Iron Pipe.—The Santa Fe Railroad is reported to have placed 650 tons of 10-in. pipe for delivery at Galesburg, Ill. At Chicago, two bidders quoted \$40, delivered, or \$31.80. Birmingham, on 1620 tons of 6 and 8-in. Class B pipe. The Allied Contractors, Chicago, have taken a general contract at Winfield, Ill., calling for about 400 tons of 6 and 8-in. Class

B pipe. Morton Grove, Ill., has placed 1000 tons of 6 and 8-in. pipe through a contractor. Orders this week have been in fair volume, but fresh inquiry is sluggish. Rainy weather is interfering with pipe laying and contractors are less anxious for deliveries. Several pipe foundries will close next week for repairs. Prices are firm at \$32 to \$33, Birmingham, for 6-in. diameters and larger.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$40.20 to \$41.20; 4-in., \$44.20 to \$45.20; Class A and gas pipe, \$4 extra.

Sheets.—Users continue to take sheets in small lots. New sales are light and, therefore, do not relieve the stress at mills in arranging rolling schedules. One group of hot mills in Chicago will be idle all next week, and production at Milwaukee will be halted for the coming seven days. Believing that stocks in the hands of users are running low, producers now look forward to the end of July as about the time when demand will turn upward. Light tank makers are less busy, and the roofing trade is taking a smaller tonnage. Base prices at Chicago district mills are weak at 3.60c. for galvanized, 2.75c. for black and 2.10c. for blue annealed sheets.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Northern and Southern Cast Iron Pipe Makers Combined

James B. Clow & Sons, Chicago, have purchased a controlling interest in the National Cast Iron Pipe Co., Birmingham. Both companies produce cast iron pipe. Each will retain its present name and the officers and organization of both will remain intact.

E. E. Linthicum, president and founder of the National company, will continue in that capacity. A change in the board of directors, to give the new owners proper representation, will be made. Paul A. Ivy will go with the National company as vice-president.

James B. Clow & Sons have been in business since 1878. Their pipe plants are located at Newcomerstown and Coshocton, Ohio, and their main offices are in Chicago, where they also conduct one of the largest plants in the country for the manufacture and distribution of plumbing and heating supplies.

Steel & Tubes, Inc., Cleveland, has engaged the Sessions Engineering Co., Chicago and Detroit, to prepare plans and specifications and supervise the construction of its new welded steel tubing plant to be erected at Ferndale, Mich., a Detroit suburb. Construction will start Aug. 1 and it is expected that the plant will be completed by Jan. 1.

New York

Pipe Order for 50,000 Tons Placed by Texas Co.—Price Uncertainty in Steel

NEW YORK, July 2.—Pig iron sales have been adversely affected by inventory-taking and totaled only 6000 tons for the week. Shipments, however, have not been held up as much as usual, indicating that foundries have little iron in stock and will need additional metal as soon as they resume operations. An improvement in orders for castings is rather generally reported, particularly among jobbing foundries, whose business has been of a spotty character since the first of the year. The General Electric Co. is inquiring for 500 tons of high-silicon malleable pig iron for Schenectady and is reported to have placed 150 tons of low phosphorus for the same plant. The Worthington Pump & Machinery Corporation has closed for 445 tons of foundry for its Holi-yoke, Mass., plant and 40 tons for Harrison, N. J. New inquiries in this district, most of them small, total about 2500 tons. In addition, a Massachusetts melter is in the market for 1200 tons of foundry iron. The price situation is virtually unchanged, with Buffalo foundry iron ranging from \$16 to \$17, base furnace, and eastern Pennsylvania foundry from \$19.50 to \$20, base furnace.

Prices per gross ton, deliv'd New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$20.91 to \$21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.89 to 23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

Ferroalloys.—An inquiry from the Ford Motor Co. for 1000 tons of ferro-manganese for delivery in the third quarter has appeared, but otherwise business before the market is confined to carload and small lots. Prices are unchanged at \$105, seaboard. The spiegeleisen market is firm at \$33 for the high-grade alloy. There has been a fair business in carload and small lots.

Plates, Shapes and Bars.—Uncertainty as to prices exists, notwithstanding recent announcements by mills that 2.05c., Coatesville on plates, 2.05c., Bethlehem, on shapes, and 1.90c., Pittsburgh, on bars, would be the ruling third quarter quotations. These prices have not been established, except on a few minor transactions, though a good many contract buyers have signed up for third quarter at the new levels. Specifications against these contracts probably will not be received in any great number for a few weeks, and price developments in the interim will be watched closely by both sellers and consumers. The fact that many contract buyers did not exercise in full their second quarter options at prices \$1 a ton below the level announced for this quarter may indicate either a decline

in consumption or lack of confidence in price stability. On plates spotty weakness has developed. Although most of the sales are at 2.17½c., delivered New York, concessions of \$1 a ton have been given on desirable

orders. A Pittsburgh price of 1.80c., equal to 2.14c., delivered New York, also has appeared in some instances. Quotations received last Friday by the New York Central Railroad on its third quarter requirements disclosed a variety of price ideas. On plates the low Eastern quotation was 1.85c., Newberry Junction, submitted by the Central Iron & Steel Co., Harrisburg, Pa. The Lukens Steel Co., which three months ago quoted 1.85c., same delivery point, put in a price of 1.90c., Newberry Junction. The Carnegie Steel Co. bid 1.90c., Youngstown, or 2.03c., West Seneca, N. Y., on the three commodities; Youngstown Sheet & Tube Co., 1.90c., Youngstown; Jones & Laughlin Steel Corporation, 1.90c., Youngstown, or 2c., Buffalo; Bethlehem Steel Co., 1.90c., West Seneca; Otis Steel Co., 1.85c., Cleveland, on plates; Granite City Steel Co., 1.85c., Granite City, Ill., on plates; Alan Wood Iron & Steel Co., 2.18½c., Newberry Junction, on plates. Chicago bids were 2.10c., Chicago, by the Illinois Steel Co. and 2c., Indiana Harbor, by the Inland Steel Co. Many large structural projects involving substantial tonnages are under negotiation and probably will be awarded during the summer. Among those not previously reported are an office building for the American Exchange-Irving Trust Co. at 1 Wall Street and a garment manufacturing building on Seventh Avenue, each of which will take about 10,000 tons. A high school building in Brooklyn calls for 3500 tons.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Pipe.—The Texas Co., New York, has given an order for 50,000 tons of steel pipe to the Youngstown Sheet & Tube Co., for a pipe line in Texas. This is a portion of a large pipe line project which the Texas Co. has under way. A recent contract for about 25,000 tons was awarded to the A. O. Smith Corporation, Milwaukee, for fabrication.

Sheets and Strips.—Weakness continues in sheets, but prices are no lower. The galvanized product is quite freely obtainable at 3.50c. or less, Pittsburgh, while on black sheets the open market price is 2.65c., Pittsburgh. Sales of blue annealed sheets are still commonly made at 2c., Pittsburgh, but the extra of 10c. per 100 lb. on widths exceeding 40 in. is frequently waived on desirable orders. On cold-rolled strip steel, concessions of \$1 a ton have been given by some mills on orders of fair size, thus making the market range 2.70c. to 2.75c., Pittsburgh, for lots or 3 tons or more. On hot-rolled strips concessions of \$1 a ton have not been infrequent. Quotations on the black sheet requirements of the New York Central Railroad, opened last Friday, ranged from 2.65c., Niles, Ohio, mill, put in by the Mahoning Valley Steel Co. to 3.05c., Newberry Junction, the bid of Bethlehem Steel Co. Blue annealed quotations covered a wide range, from 1.99c., Youngstown, bid by the Sheet

Metal Mfg. Co., to 2.38½c., Newberry Junction, put in by the Alan Wood Iron & Steel Co. The Otis Steel Co. quoted 2c., Cleveland, and the Youngstown Sheet & Tube Co. and the Sharon Steel Hoop Co. both bid 2c., Youngstown.

Cast Iron Pipe.—The market has been slightly more active in the past week, but business is still rather dull and buying is confined mostly to small lots, principally by private users. Southern makers continue to quote \$32 to \$33, Birmingham, while Northern foundries seem to be adhering to a range of \$37.60 to \$38.60, delivered New York. The Warren Foundry & Pipe Co. is low bidder on 300 tons of 8-in. and 12-in. water pipe for the city of New York, and the United States Cast Iron Pipe & Foundry Co. is low on 500 tons for 12-in., class C pipe for Yonkers, N. Y. Bloomfield, N. J., opened bids on July 2 for a small tonnage of pipe and fittings.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Warehouse Business.—June business was slightly smaller than that of May with most jobbers in this district. Black and galvanized sheet prices still show weakness, but 3.80c. to 4c. per lb., base, on black and 4.50c. to 4.70c., base, on galvanized are representative of the market.

Old Material.—Buying prices are substantially unchanged, but an undertone of weakness continues in most grades. No. 1 heavy melting steel is being bought at \$12.50 per ton, delivered, and blast furnace scrap at \$9 to \$9.50 per ton, delivered. These are the most active grades, except for some purchasing of yard grade of heavy melting steel at \$10 to \$10.50 per ton, delivered to Harrisburg, Pottsville and Conshohocken, Pa.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.50 to \$9.85
Heavy melting steel (yard)	6.25 to 7.00
No. 1 hvy. breakable cast.	11.00 to 12.00
Stove plate (steel works)...	7.00 to 7.25
Locomotive grate bars...	7.00 to 7.50
Machine shop turnings...	6.00 to 6.50
Short shoveling turnings...	6.00 to 6.50
Cast borings (blast furn. or steel works).....	6.00 to 6.50
Mixed borings and turnings.....	6.00 to 6.50
Steel car axles.....	14.50 to 15.00
Iron car axles.....	23.75 to 24.75
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25
Forge fire.....	6.50 to 6.75
No. 1 railroad wrought.....	9.50 to 10.00
No. 1 yard wrot., long....	8.00 to 8.50
Rails for rolling.....	10.00 to 10.50
Cast iron carwheels.....	11.00 to 11.50
Stove plate (foundry)....	8.50 to 9.00
Malleable cast (railroad)...	10.00
Cast borings (chemical)...	10.75 to 11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.00 to \$15.00
No. 1 hvy. cast (columns bldg. materials, etc.), cupola size.....	12.00 to 13.00
No. 2 cast (radiators, cast boilers, etc.).....	11.50 to 12.50

Reinforcing Bars.—About 700 tons of bars is to be purchased this week by Rodgers & Hagerty, Inc., general contractor for a section of the New York subway. A considerable tonnage will be needed for the Samuel Tilden High School in Brooklyn, for

which estimates are being prepared. The volume of small orders is keeping up at a good rate, and although the total business placed during the first half of the year was not up to the expectations of most of the distributors, prospects for the summer months are good. The mill price is somewhat weaker, and although some distributors are still getting 2c., Pittsburgh, for small orders, others are openly quoting 1.90c., on any attractive tonnage. The Youngstown warehouse price is unchanged at 2.20c. per lb. or 2.57½c., on cars at New York, and out of New York warehouse the common quotations are 2.80c. for lots of 5 tons or more, 2.95c. for lots of 2 to 5 tons and 3.24c.

for less than 2 tons, all delivered at job.

Coke.—With scarcely any activity in the market and decreasing operations in the Connellsville district, prices are being maintained at \$3.50 per ton, Connellsville, for standard foundry coke and \$2.50 to \$2.75 for the furnace grade. Special brands of foundry coke are quoted at \$4.85, f.o.b. ovens, and delivered prices are: To northern New Jersey, Jersey City and Newark, \$8.56 per net ton; to New York and Brooklyn, \$9.44 per net ton. By-product foundry coke is unchanged at \$9 to \$9.40 per net ton, Newark or Jersey City, and \$10.06 to \$10.29 per net ton, New York or Brooklyn.

Philadelphia

Steel Prices Not Firm at \$1 Advance and Few Contracts Have Been Made

PHILADELPHIA, July 2.—Apparently few third quarter contracts for bars, shapes and plates have been made at the new level of prices announced as effective for third quarter. The new prices are 1.90c., Pittsburgh, for bars, 2.05c., Coatesville, for plates and 2.05c., Bethlehem, for shapes. Recent sales have been at prices \$1 a ton lower in the case of bars and plates and \$1 to \$2 lower on shapes. At the opening of bids last week by the New York Central Railroad on its third quarter requirements there were low quotations of 1.90c., West Seneca, N. Y., on bars, 1.90c., Newberry Junction, on shapes and 1.85c., Newberry Junction, on plates. The Pennsylvania Railroad has not yet appeared as a buyer for third quarter except on track materials and steel pipe.

Pig Iron.—Many foundries in this district are shutting down for several days to a week for the usual inventory period, and the market has become less active than in recent weeks. Contracting for third quarter has been light. The price on the foundry grade is unchanged at \$20, furnace. Low phosphorus has been sold in fair quantities in other districts, but locally demand is light.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26
East. Pa. No. 1X.....	21.76
Basic (del'd east. Pa.)...	\$19.00 to 19.50
Gray forge.....	19.75 to 20.25
Malleable.....	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)...	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace).....	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—The larger consumers have been covering for third quarter and second half at \$105 per ton, seaboard. A recent inquiry is for 1000 tons of 78 to 82 per cent ferromanganese for the Fordson plant of the Ford Motor Co.

Billets.—Rerolling quality billets are still quoted at \$33 per ton, Pittsburgh, but about \$1 a ton less could be done on a desirable specification. The forging grade is firm at \$38 per ton, Pittsburgh.

Bars.—Mills are asking 1.90c., Pittsburgh, or 2.22c., delivered, Phila-

delphia, on new business, but recent sales have been at 1.85c., Pittsburgh. It is likely that the new department store building for Strawbridge & Clothier will be built of reinforced concrete, in which case about 4000 tons of bars will be required.

Shapes.—Efforts to bring shape prices up to the levels of bars and plates do not appear to have met with much success, and although 2.05c., Pencoyd, or 2.11c., Philadelphia, and 2.05c., Bethlehem, or 2.18c., Philadelphia, are still being quoted on current business, a price \$1 a ton below the above-mentioned minimum is not uncommon; on especially desirable tonnage even less than 2c., Pencoyd, is said to be obtainable.

Plates.—Mills are obtaining 2.05c., Coatesville, or 2.15c., Philadelphia, on small orders for prompt shipment. In some cases contracts have been made at 2c., Coatesville, or 2.10c., Philadelphia.

Sheets.—Few contracts have been made for the third quarter, consumers evidently intending to buy as their needs arise. Blue annealed sheet sales are being made at 2c. to 2.10c., Pittsburgh, or 2.32c. to 2.42c., Philadelphia. Black sheets are quiet at 2.65c., Pittsburgh, or 2.97c., Philadelphia, and galvanized sheets are still quoted at about 3.50c., Pittsburgh, or 3.82c., Philadelphia.

Warehouse Business.—June business was smaller than that of May and current buying is confined almost

entirely to very small lots. Prices are being maintained and the quantity differentials are generally observed.

Old Material.—All grades of scrap continue weak. Railroad grate bars are quotable at \$11 to \$12 per ton, delivered, on the basis of recent small sales to foundries at about \$12 per ton, though steel plants have not paid above \$11. The total of No. 1 heavy melting steel recently bought by a large eastern Pennsylvania consumer is reported at 25,000 to 30,000 tons, and the price was \$13 per ton, delivered. Yard grade of heavy melting steel has been bought at \$10.50 per ton, delivered Harrisburg and Pottsville, Pa. While heavy axle turnings are quoted at \$12 per ton, the maximum that has been paid by steel mill consumers, small lots have been sold to steel foundries at \$12.50 and \$13 per ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$13.00 to \$13.50
Scrap T rails	12.50 to 13.00
No. 2 heavy melting steel	10.50 to 11.00
No. 1 railroad wrought	13.50 to 14.50
Bundled sheets (for steel works)	10.00 to 10.50
Machine shop turnings (for steel works)	10.50
Heavy axle turnings (or equiv.)	12.00
Cast borings (for steel works and roll. mill)	10.50
Heavy breakable cast (for steel works)	15.00 to 15.50
Railroad grate bars	11.00 to 12.00
Stove plate (for steel works)	11.00
No. 1 low phos., hvy., 0.04% and under	17.50 to 18.00
Couplers and knuckles	14.50 to 15.00
Rolled steel wheels	14.50 to 15.00
No. 1 blast f'nace scrap	9.50 to 10.00
Mach. shop turnings (for roll. mill)	11.00 to 11.25
Wrot. iron and soft steel pipes and tubes (new specific.)	12.00 to 12.50
Shafting	17.00 to 17.50
Steel axles	19.00 to 20.00
No. 1 forge fire	11.00 to 11.50
Cast iron carwheels	15.50 to 16.00
No. 1 cast	15.50 to 16.00
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	14.50 to 15.00

Imports.—In the week ended June 30, arrivals of iron ore totaled 6450 tons from Algeria, and 602 tons of chrome ore came in from Portuguese Africa. Only 251 tons of pig iron was received, all from the Nether-

lands. Steel arrivals consisted of 100 tons of steel bars, 841 tons of structural shapes, 183 tons of skelp, 50 tons of steel plates and 62 tons of

steel bands from Belgium; 31 tons of blooms from France; 106 tons of structural shapes and 34 tons of steel scrap from Germany.

Cleveland

Steel Buyers Slow to Contract for Third Quarter—Basic Pig Iron Is Firmer

CLEVELAND, July 2.—The third quarter has started with very little contract tonnage on the mill books. There is still a lack of confidence on the part of buyers that the 1.90c. price will be maintained on steel bars, plates and structural material, although mills are still holding out for the advance. Quite a few contracts were taken at 1.90c. during the week, but in these cases buyers evidently felt assured that should the market settle down to 1.80c. they will be given advantage of the lower price. An Ohio mill has closed some third quarter plate contracts at 1.85c., but is now asking 1.90c. Although plates appear to be still available at 1.85c., consumers as a rule are still inclined to withhold the placing of contracts and mills are making little effort to force sales.

Specifications against expiring second quarter contracts showed a fair gain in the past week and as mills continued to take current orders up to July 1 at the 1.85c. price, many consumers are covered for their July requirements. In spite of the better specifications during the week, the tonnage booked in this territory in June fell slightly below that of May.

Several of the automobile companies in the Michigan territory are slowing down production and will take considerably less steel this month than in June. However, large orders are coming from one or two car companies which are bringing out new models and recent production has been maintained by one or two makers of low priced cars. Taking it altogether, business from the automotive field is expected to be quite satisfactory for July and most of the automobile makers are buying for a month's requirements, although some have inquiries out for the third quarter.

Pig Iron.—The market has continued fairly active in most districts served by furnaces operated by Cleveland interests. Sales by these producers during the week totaled 34,000 tons in foundry and malleable iron. An Ohio sanitary interest purchased 1000 tons and there was some round-lot buying in the Michigan territory. The National Malleable & Steel Casting Co. purchased 1000 tons of basic iron from a broker for its Sharon, Pa., plant at \$16.50, delivered. This will be shipped from the Youngstown district and indicates a firmer tone in the basic market. Following the recent 50c. per ton concession to \$17.50, furnace, for foundry and malleable iron for Cleveland delivery, that has become the ruling Cleveland price. This makes the price 50c. a ton under the delivered price of Valley iron at \$16.75, furnace. Prices are unchanged in other sections. Lake furnace quotations range from \$16.25 to \$17, except in Michigan, where \$17.50 is being maintained. A Cleveland producer is seeking business in the Michigan territory. Shipments during June were about equal to those in

May. The usual July shutdown has resulted in some curtailment in shipping orders. Shipments to the automotive industry are expected to show a falling off of 20 per cent this month, compared with June's.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.00
S'th'n fdy., sil.	1.75 to 2.25	21.50
Malleable		18.00
Ohio silvery, 8 per cent		28.00
Basic Valley furnace		16.00
Stand. low phos., Valley furn.		26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Semi-Finished Steel.—A local maker has reestablished its present prices of \$32.50 to \$33, Cleveland, for sheet bars, billets and slabs for the third quarter and has closed with many of its customers on that basis. This producer is still able to keep all of its 14 open-hearth furnaces in operation.

Coke.—There is a fair demand for foundry coke in specifications against contracts, but little new demand. Prices are unchanged at \$3.50 to \$4.85 a ton, ovens, for standard Connellsville foundry coke and \$7.75 for Ohio by-product coke.

Bolts, Nuts and Rivets.—Orders from the automotive and agricultural implement manufacturers and jobbers are holding up well. One local maker reports a gain of 10 per cent in business during June over May, although this is probably exceptional. Most buyers have covered with third-quarter contracts. Rivets are dull.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.50c. to 2.60c.
Plates, ⅜-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes, iron bars (except bands)	2.60c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.50c. to 3.00c.
Cold-fin. steel, rounds and hex.	3.35c.
Cold-fin. steel, sq. and flats	3.85c.
Steel hoops	3.50c.
Steel bands, No. 12 to ⅜-in., inclus.	3.25c.
Spring steel	5.00c.
*Black sheets (No. 24)	3.85c.
†Galvanized sheets (No. 24)	4.60c.
Blue ann'l'd sheets (No. 10)	3.15c.
Diam. pat. floor plates—	
¼-in.	5.30c.
⅜-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.75c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue ann'l'd sheets (No. 10)	3.25c.
No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

Iron Ore.—Water shipments of Lake Superior ore during June were 8,926,216 tons, compared with 8,458,866 tons during the same month last year. Lake shipments to July 1 were 14,295,125 tons, compared with 17,771,423 tons during the corresponding period last year.

Sheets.—New demand is light, consumers' stocks are low and most buyers want quick deliveries. Buyers, as a rule, are showing no interest in third quarter contracts. Specifications from the automotive industry are holding up well. Prices show virtually no change. Black sheets are well stabilized at 2.65c., Pittsburgh, although some business is going at 2.60c. Blue annealed sheets range from 1.90c. to 2c., Pittsburgh, and galvanized from 3.45c., Valley, to 3.50c., Pittsburgh. Jobbers are quoting car lots at 3.55c., Valley. Auto body sheets are firm.

Strip Steel.—A fair amount of new business in hot-rolled was placed by the automotive industry during the week and most large consumers are under cover for either the third quarter or several weeks' requirements at prices they paid for the last quarter, or 1.75c., Pittsburgh, for 6-in. and wider strip and 1.85c. for 3 to 6-in. material. A fair volume of activity has developed. On cold-

rolled strip the \$2 a ton reduction to 2.65c., Cleveland, for 3 tons and over now appears to be quite general.

Wire Products.—The nail market in northern Ohio has a weaker tone than recently and buyers are finding it easier to secure the \$2.55 per keg price. This is commonly quoted to jobbers. Wire is firm.

Reinforcing Bars.—Keen competition is still causing price irregularities on billet steel bars. Rail steel bars are unchanged at 1.75c., mill. New inquiry is light.

Warehouse Business.—The volume of sales during June was about the same as in May. Prices are well maintained, except on black and galvanized sheets.

Old Material.—A Cleveland mill purchased 4000 to 5000 tons of machine shop turnings during the week at an average price of about \$7.85 a ton. Dealers have bought some scrap against these contracts at \$7.50, but some are now offering only \$7.25. This is a good advance over prices that have been prevailing here recently for local scrap that must find an outside market, but the mill price is well under the price at which Detroit scrap with a \$3 a ton freight rate can be delivered in Cleveland. The general tone of the market is weak. Blast

furnace scrap is 24 cents a ton lower, evidently reflecting the weakening in pig iron prices. The maximum price now is \$9.25, and although the supply is not plentiful at that price, distress material has sold as low as \$9. Dealers are now buying heavy melting steel scrap covering the specifications of a local mill at \$13.40, as compared with a recent price of \$13.60.

Prices per gross ton, deliv'd consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$13.00 to	\$13.25
No. 2 heavy melting steel.	12.50 to	12.75
Compressed sheet steel.	12.50 to	13.00
Light bundled sheet		
stamp'gs	11.50 to	11.75
Drop forge flashings.	11.50 to	11.75
Machine shop turnings.	7.25 to	7.50
No. 1 railroad wrought.	11.50 to	12.00
No. 2 railroad wrought.	13.50 to	13.75
No. 1 busheling.	11.00 to	11.25
Pipes and flues.	9.00 to	9.50
Steel axle turnings.	12.50 to	13.00
Acid Open-Hearth Grades		
Low phos. forging crops.	16.50 to	17.00
Low phos., billet, bloom and slab crops.	17.00 to	17.50
Low phos. sheet bar crops	16.50 to	17.00
Low phos. plate scrap.	16.00 to	16.50
Blast Furnace Grades		
Cast iron borings.	9.00 to	9.25
Mixed bor'gs and short turn'gs	9.00 to	9.25
No. 2 busheling.	9.00 to	9.25
Cupola Grades		
No. 1 cast.	16.25 to	16.75
Railroad grate bars.	11.00 to	12.00
Stove plate	12.00 to	12.50
Rails under 3 ft.	16.75 to	17.25
Miscellaneous		
Railroad malleable.	15.00 to	15.50
Rails for rolling.	16.25 to	16.50

RAILROAD EQUIPMENT

THE Erie Railroad has ordered 100 steel furniture cars and the Chicago & Eastern Illinois is inquiring for 100 automobile cars. The Norfolk & Western will rebuild 500 90-ton steel gondolas at its Roanoke shops. Details of the week's business follow:

Chesapeake & Ohio is inquiring for six gas-electric rail motor cars and five trailers.

Saginaw Logging Co., Saginaw, Mich., has purchased one 2-8-8-2 type locomotive from Baldwin Locomotive Works.

International Railways of Central America have ordered four 2-8-2 type locomotives from Baldwin Locomotive Works.

Chicago & Illinois Midland has ordered one 4-4-0 type locomotive from Baldwin Locomotive Works.

Erie Railroad has placed order for 100 steel furniture cars with Magor Car Corporation.

Norfolk & Western will rebuild 500 90-ton steel gondola cars at its Roanoke, Va., shops.

Cities Service Corporation, New York, has made inquiry for four tank cars.

Chicago & Eastern Illinois will buy 100 40-ft. automobile cars.

Wage Coal and Coke Scale Reduction

The H. C. Frick Coke Co., coal and coke subsidiary of the United States Steel Corporation, has posted notices of an adjustment in wage scales, effective July 1, the first change made by this company since Aug. 23, 1922.

No change has been made in the scale for pick mining, nor in the rate for outside day labor, but all other classifications have been reduced and will now draw wages slightly higher than the average of independent companies.

The adjustment has no significance outside of the coal industry. Since August, 1922, the company has been paying substantially the so-called Jacksonville wage scale without the check off and has been standing alone for more than a year in paying that scale, as the operators who formerly operated under an agreement with the union did not renew the arrangement with its termination on April 1, 1927. It was a recognition of the fact that its scale was unnecessarily high that prompted the revision. The official statement observes:

"The H. C. Frick Coke Co. has always paid and will continue to maintain its policy of paying the highest prevailing rate in the district in which it operates."

The United Engineering & Foundry Co., Pittsburgh, has completed at its Frank-Kneeland plant one of its new No. 130 slab shears. It is of the motor-driven, down cut, crank and pitman type with a cast steel knife head running in slides fitted with bronze liners. It has a speed of 12 cuts per min. and a stroke of 10 in. The pressure exerted between the knives, which have no rake and are 45 in. long, is 1,300,000 lb., capable of shearing a hot soft steel slab 6 in. thick and 40 in. wide.

Steel Furniture Business Far Ahead of Last Year

Orders for steel furniture in the "business group" in May were valued at \$3,085,365, against \$2,915,344 in April, according to reports received by the Department of Commerce from 33 manufacturers. May, 1927, showed only \$2,381,369. Sales of steel furniture in the "shelving group" in May were valued at \$732,921, compared with \$740,658 in April, according to reports received from 15 companies. In May, 1927, the total was \$686,144.

Shipments in the "business group" in May were valued at \$3,213,018, against \$3,065,637 in April, while unfilled orders at the end of May were valued at \$2,232,594, compared with \$2,359,877 at the end of April.

For the five months ended with May orders in the "business group" were valued at \$15,828,064, compared with \$13,812,453 for the corresponding period of last year, while shipments were valued at \$15,069,196 and \$13,876,272 respectively.

May shipments of shelving furniture were valued at \$768,562, against \$716,104 in April, and unfilled orders were valued at \$752,512 and \$793,903 respectively.

Orders in this group for the five months ended with May were valued at \$3,824,735, compared with \$3,232,206 for the corresponding period of last year, while shipments were valued at \$3,678,536 and \$3,117,543 respectively.

San Francisco

Shapes in Chief Demand—Concrete Bars Made Best Showing in First Half

SAN FRANCISCO, June 29 (By Air Mail).—Tonnage movement on the Pacific Coast during the first half of the year, with one exception, reinforcing steel bars, did not equal the volume for the first half of 1927. Mill representatives are, however, well satisfied in general with bookings. The unsatisfactory price structure applies both to plain material and to finished products. The outlook for the rest of the year is fair.

Building activity in Los Angeles is well maintained and during the first 20 days of the month 2100 permits were issued, with a valuation of \$6,878,087, compared with 2092 permits and a value of \$6,147,557 for the same period in June, 1927.

Pig Iron.—Little of importance has happened in the foundry iron market during the past week, both sales and inquiries involving relatively small lots. No change is noted in prices, which are as follows:

Prices per gross ton at San Francisco:	
*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00
**German fdy., sil. 2.75 to 3.25	24.25

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar awards this week did not exceed 400 tons. Bookings for the first half of the year, as reported each week in THE IRON AGE, aggregated 33,098 tons. The Pacific Coast Steel Co. secured 155 tons for the Sears-Roebuck Building at Tacoma, and 100 tons for a mausoleum in San Jose, Cal. Prices in the Bay district are slightly stronger and 2c. on out-of-stock material appears to be the general run now, fewer 1.80c. quotations coming out.

Plates.—Plate awards during the first half of the year were nearly a third less than the bookings for the corresponding period last year. This condition is due to the inactivity in the oil fields in California and also to the fact that several large pipe line projects went to reinforced concrete instead of riveted or welded steel. No awards of size were reported this week. Prices range from 2.25c. to 2.30c., the former figure applying to desirable tonnage.

Shapes.—The structural steel shape market continues to be the most active one on the Coast. Awards this week were light, only two projects of over 100 tons going through.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, $\frac{3}{8}$ -in. and over	3.15c.
Small angles, under $\frac{3}{8}$ -in.	3.55c.
Small channels and tees, $\frac{3}{4}$ -in. to 2 $\frac{3}{4}$ -in.	3.75c.
Spring steel, $\frac{1}{4}$ -in. and thicker	5.00c.
Black sheets (No. 24)	4.95c.
Blue ann'd sheets (No. 10)	3.90c.
Galv. sheets (No. 24)	5.50c.
Struc. rivets, $\frac{1}{2}$ -in. and larger	5.65c.
Com. wire nails, base per keg	\$3.40
Cement c't'd nails, 100-lb. keg	3.40

The Wallace Bridge & Structural Steel Co. took 450 tons for a clinker storage warehouse for the Pacific Coast Cement Co. at Seattle; and Judson-Pacific Co. secured 270 tons for an addition to the Robert Dollar Building in San Francisco. For the first half of this year 87,075 tons of shape

and plate material were booked. Prices on plain shapes from domestic sources remain firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe has fallen off and awards this week totaled less than 500 tons. Bookings during the first half of the year totaled 41,834 tons, which approximated the tonnage placed during the same period a year ago. The U. S. Cast Iron Pipe & Foundry Co. took 115 tons of 8 to 20-in. centrifugal pipe for Seattle. The Gateway Concrete Pipe & Products Co., Holtville, Cal., were awarded 321 tons of 4 to 10-in. class B pipe for Holtville. Pending business does not exceed 1100 tons.

Coke.—Both sales and inquiries of coke were limited to small lots. Stocks in foundry yards appear sufficient to take care of present requirements.

Boston

Railroad Bridge Work to Take 15,000 Tons of Steel—Coke Price Unchanged

BOSTON, July 2.—Most of the pig iron orders taken in the past week called for car lots or special analyses. The aggregate tonnage was less than it has been for any similar period in months. Prices appear steadier, as there is little incentive to shade them. One foundry is inquiring in 1200 to 1500 tons of No. 2X and No. 1X. Otherwise there is no prospective business of importance. A large majority of the jobbing foundries report business as poor, but most of the large ones and the most important manufacturing foundries say it is better than a month ago. At the current rate of melt, New England foundries in general have sufficient iron on hand or on order to last into the third quarter, and some cases into the fourth.

Foundry iron prices per gross ton deliv'd to most New England points:

Buffalo, sil. 1.75 to 2.25	\$20.91 to \$21.91
Buffalo, sil. 2.25 to 2.75	21.41 to 22.41
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	24.15 to 24.65
Va., sil. 1.75 to 2.25	25.71
Va., sil. 2.25 to 2.75	26.21
Ala., sil. 1.75 to 2.25	22.41 to 24.27
Ala., sil. 2.25 to 2.75	22.91 to 24.77

Freight rates: \$4.91 from Buffalo, \$3.65 from eastern Pennsylvania, \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.

Coke.—The New England Coal & Coke Co. and the Providence Gas Co. announce that there will be no change in the price of by-product foundry coke in July. It remains at \$11 a ton, delivered within a \$3.10 freight rate zone. Both companies also report a decided improvement in the demand for such fuel. Shipments in the closing week of June were larger than for any similar period in almost a year. In explanation, it is said that a large number of foundries suddenly ran out of fuel. The New England iron melt has not increased perceptibly. Domestic fuel is moving in fair volume.

Shapes and Plates.—No important fabricating jobs have been awarded,

but there have been a large number of small lettings. With five new Boston & Maine Railroad bridges up for figures, indications are that approximately 15,000 tons of steel will be awarded within the next fortnight. Mills generally quote standard plates at 1.90c. per lb., base Pittsburgh, but fabricators claim that price could be shaded on a sizable tonnage. Bookings are only fair. Buying of plates continues on a hand-to-mouth basis, with 1.90c. per lb., base Pittsburgh, the going price on ordinary orders.

Cold-Rolled Strip.—Buying of cold-rolled strip steel is only fair. So far there has been no general third quarter buying. While most mills are endeavoring to obtain the equivalent to 3.30c. per lb., Worcester, for 1 to 3-

ton lots, others have cut prices as low as 3.15c.

Warehouse Business.—New England warehouses did a larger business in June than in May, or in June, last year. This showing is all the more noteworthy in view of general business conditions and to the hand-to-mouth character of purchases from warehouse. Prices are firmer than a month ago, cuts being few and by small sellers. No reduction has been made in cold-finished stock, despite the cut in mill prices.

Cast Iron Pipe.—So far as can be ascertained the C. & R. Construction Co. has not placed the 4000 tons of 30-in. pipe required for its State contract. There is a possibility that steel pipe will be used. Portland, Me., is calling for bids on a sizable tonnage of 16-in. flexible-joint pipe, although the Government has not approved that city's plans. Lynn, Mass., is calling for bids on July 2 for 150 tons of 6-in. to 12-in. pipe. Private business is seasonally quiet. The price situation

remains unchanged. The market for 4-in. pipe is firm at \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and at \$41.10 to \$42.10 for 6-in. to 12-in. Larger pipe is still subject to concessions. The usual \$5 differential is asked for Class A and gas pipe.

Old Material.—Buying and selling continues on a small scale. Anticipated purchases of yard and No. 1 steel for export to Danzig did not develop, but is reasonably certain to come within a week or 10 days. The export movement has been held up by a lack of steamer space. Prices in general appear easy, although not actually lower, except in the case of No. 1 heavy melting steel and steel turnings. About the most that dealers will now pay for heavy melting steel is \$8.10 a ton, on cars shipping point. One of the eastern Pennsylvania mills is reported as buying directly and offering \$9 a ton, but no actual sales are reported in New England. The most that dealers will generally pay for steel turnings for steel

mill use is \$5 a ton, off 50c. less than a week ago, but \$5 to \$5.50 is paid where shipment is made to blast furnaces. New England foundries continue to take small tonnages of both textile cast and No. 1 machinery, the aggregate sales for the week running into several hundred tons.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$7.75 to	\$8.10
Scrap T rails.	8.00 to	8.50
Scrap girder rails.	7.50 to	8.00
No. 1 railroad wrought.	9.00 to	9.50
No. 1 yard wrought.	7.00 to	7.50
Machine shop turnings.	4.75 to	5.00
Cast iron borings (steel works and rolling mill).	5.25 to	5.50
Bundled skeleton, long.	5.00 to	7.00
Forge flashings.	6.50 to	7.00
Blast furnace borings and turnings.	5.00 to	5.50
Forge scrap.	5.50 to	6.00
Shafting.	12.00 to	12.50
Steel car axles.	14.50 to	15.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	7.00 to	7.50
Rails for rolling.	9.50 to	10.00
Cast iron borings, chemical	10.00 to	10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast.	\$13.50 to	\$14.00
No. 1 machinery cast.	14.00 to	14.50
No. 2 machinery cast.	12.50 to	13.50
Stove plate.	10.00 to	10.50
Railroad malleable.	13.50 to	14.50

Birmingham

One Blast Furnace Goes in and Another Is Ready—Steel Backlogs Maintained

BIRMINGHAM, July 2.—Pig iron sales are showing a gradual improvement following the recent price reduction. No marked movement has developed and the buying as a whole is steady. Some of the more important tonnages are still in abeyance, which is attributed largely to a carry over into July. Consumers appear to be satisfied with the new price of \$15.50 for No. 2 foundry iron. Shipments during the past week were off slightly. June shipments were a little ahead of those of the preceding month. The new No. 5 Fairfield furnace of the Tennessee company was blown in June 26 on foundry. The new No. 6 furnace at Fairfield is expected to be blown in by the middle of the month. Nineteen furnaces are now in blast. Of this number 11 are on foundry, six on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic	\$15.00 to 16.00

Finished Steel.—Operating backlogs are being well maintained in most lines. Inquiries vary from day to day, but are considered satisfactory as a whole. Prices show more steadiness than for several weeks. The minimum price on plates and shapes is now 2.05c., base, f.o.b. Birmingham. Structural steel fabricators and bar manufacturers report a noticeable increase in sales during the past week. The Ingalls Iron Works secured contracts for 3700 tons for a powerhouse at Mount Holly, N. C., for the Duke Power Co. and 250 tons for a hydroelectric plant at Watersville,

N. C., for the Phoenix Utility Co. The Tennessee company is now operating six open hearths at Ensley instead of seven. Five are in operation at Fairfield and the Gulf States Steel Co. continues to work four at Alabama City.

Cast Iron Pipe.—Pressure pipe manufacturers experienced another quiet week from the standpoint of both sales and inquiries. The market has lapsed into a dull period every few weeks during the past five months. Plant operations are up to normal and shipments continue to run close to production. Prices show a tendency toward firmness, with quo-

tations at \$32 to \$33 for sizes of 6 in. and over.

Coke.—Most of the contract business for the last half has been placed. The spot market is only moderately active. Quotations remain unchanged, the base being \$5 for both spot and contract.

Old Material.—The market is still lacking in consumer interest and shows no indication of a change from the unusual dullness of the past three weeks. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.	\$8.50 to	\$9.00
Scrap steel rails.	11.00 to	11.50
Short shoveling turnings.	7.50 to	8.00
Cast iron borings.		8.00
Stove plate.		13.50
Steel axles.	19.00 to	20.00
Iron axles.	20.00 to	21.00
No. 1 railroad wrought.	10.00 to	10.50
Rails for rolling.		13.00
No. 1 cast.		14.25
Tramcar wheels.	12.50 to	13.50
Cast iron carwheels.	12.00 to	13.00
Cast iron borings, chem.	13.50 to	14.00

Buffalo

Mill Operations Average 80 Per Cent—Boat Shipments Reduce Local Scrap Demand

BUFFALO, July 2.—Little pig iron business has been placed recently. Inquiries are almost entirely for lots of 50 to 100 tons. The Massey-Harris Harvester Co. is still in the market for 1000 to 2000 tons for Batavia, N. Y., and Canada, and this seems to be the only outstanding tonnage. Shipments against old orders are good, and prices in this district, at \$17 for No. 2 plain and \$17.50 for malleable, appears to be firm. Twelve furnaces are in blast here.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.	\$17.00
No. 2X fdy., sil. 2.25 to 2.75.	17.50
No. 1X fdy., sil. 2.75 to 3.25.	18.50
Malleable, sil. up to 2.25.	17.50
Basic.	\$16.50 to 17.00
Lake Superior charcoal.	27.28

Finished Steel.—Mill operations continue to average about 80 per cent. Bars and shapes are fairly firm, but sheets are softer. On bolts and nuts the market is stable. Specifications for bolts and nuts are a shade lighter

Warehouse Prices, f.o.b. Buffalo

Base per Lb.

Plates and struct. shapes.	3.40c.
Soft steel bars.	3.30c.
Reinforcing bars.	2.75c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds.	3.95c.
Cold-rolled strip steel.	5.85c.
Black sheets (No. 24).	4.20c.
Galv. sheets (No. 24).	4.70c. to 5.05c.
Blue ann'd sheets (No. 10).	3.70c.
Com. wire nails, base per keg.	\$3.65
Black wire, base per 100 lb.	3.90

than last month, though orders and specifications from automotive companies exceed expectations. A considerable tonnage in small lots of reinforcing bars has been booked. Included was 400 tons for the caissons of the new Rand Building, Buffalo. Demand for bars from warehouse is heavier because mills are charging an extra on lots of 2 tons or less.

Old Material.—The outstanding feature of the market is the practically complete suspension for three weeks of all scrap shipments to the largest consumer in the district. Operations at this plant continue high, but boat shipments of scrap from Detroit are cutting into the business of local dealers. One consumer has bought 1000 tons of heavy melting steel at \$14.25, and stove plate has been sold at \$13.50. No. 2 steel has been purchased at a reported price of \$12.25. A small tonnage of No. 1 machinery cast has been sold at \$14 to \$14.25. The Michigan Central, Pennsylvania and Erie Railroad lists close the week of July 2. The tendency of the market is to soften.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$14.00 to \$14.25
No. 2 heavy melting steel.	12.25 to 12.75
Scrap rails	13.50 to 14.00
Hydraulic comp. sheets.	12.25 to 12.75
Hand bundled sheets.	8.50 to 9.00
Drop forge flashings.	12.00 to 12.50
No. 1 busheling.	12.25 to 12.75
Hvy. steel axle turnings.	12.00 to 12.50
Machine shop turnings.	7.75 to 8.25

Acid Open-Hearth Grades

St. Louis

Third Quarter Pig Iron Sales—Several Railroad Steel Inquiries

ST. LOUIS, July 2.—The principal pig-iron purchase of the week was 1200 tons by stove manufacturer in the district from the St. Louis Gas & Coke Corporation for third quarter shipment, and other stove foundries contributed to that maker's total of 2600 tons for the week. Most stove foundries in the district will close the first week in July for inventory, and then it is expected that they will resume on nearly full scale, when furnaces look for considerable buying from this source. An Indiana implement maker took 500 tons for third quarter and the only other sizable order of the week was 300 tons from an Iowa job foundry. Sales of Southern iron were light. Prices are unchanged.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.	\$19.00
N'th'n No. 2 fdy., deliv'd St. Louis.	20.16
Southern No. 2 fdy., deliv'd.	19.92
Northern malleable, deliv'd.	20.16
Northern basic, deliv'd.	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Buying of coke is disappointing to the by-product ovens in the district. Dealers are acting slowly in laying in their winter's supply, and foundries are behind their contract schedules.

Finished Iron and Steel.—The Granite City Steel Co. reports that all of their departments are operating full except galvanized sheets, which is at 60 to 65 per cent of capacity. Incoming business in sheets shows some improvement, and that company is holding firm at recent new prices, although it is understood that some mills are cutting prices to get business. The Missouri Pacific and Missouri-Kansas-Texas Railroads are in the market for third-quarter requirements of plates, shapes and bars, and the St. Louis Southwestern Railroad has asked for prices on third quarter requirements of track bolts and track

spikes. Warehouse business is fair in the St. Louis industrial district, although not quite up to this period last year, but very little is coming from the oil fields, whose demand normally is large. Business with structural fabricators is light.

Old Material.—The market for scrap continues quiet, and there is little buying by consumers or by dealers, the latter having about covered on all contracts. Mills give no indications of buying anything soon except small tonnages here and there to fill out. Heavy melting steel, heavy shoveling steel, railroad springs, No. 2 railroad wrought, No. 1 busheling, steel car axles, No. 1 railroad wrought, steel angle bars, and cast iron car wheels are 25c. a ton lower, and machine shop turnings, wrought iron bars and transoms are 50c. lower. Relaying rails of 60 to 90-lb. weights are in fairly good demand from the coal fields. Railroad lists include: Chicago, Burlington & Quincy, 4500 tons; Big Four Lines, 1000 tons; Missouri Pacific Railroad, 160 carloads; Mobile & Ohio, 26 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.	\$10.75 to \$11.25
No. 1 locomotive tires.	12.00 to 12.50
Heavy shoveling steel.	10.75 to 11.25
Miscell. stand.-sec. rails, includ'g frogs, sw'ches and guards, cut apart.	12.25 to 12.75
Railroad springs.	13.25 to 13.75
Bundled sheets	8.50 to 9.00
No. 2 railroad wrought.	11.00 to 11.50
No. 1 busheling	9.50 to 10.00
Cast iron borings.	8.75 to 9.25
Iron rails	13.00 to 13.50
Rails for rolling	13.00 to 13.50
Machine shop turnings.	6.50 to 7.00
Steel car axles.	17.25 to 17.75
Iron car axles.	25.50 to 26.00
Wrot. iron bars and trans.	18.50 to 19.00
No. 1 railroad wrought.	9.75 to 10.25
Steel rails, less than 3 ft.	15.00 to 15.50
Steel angle bars.	11.50 to 12.00
Cast iron carwheels.	13.00 to 13.50
No. 1 machinery cast.	13.00 to 13.50
Railroad malleable	11.25 to 11.75
No. 1 railroad cast.	13.00 to 13.50
Stove plate	11.00 to 11.50
Agricult. malleable.	12.00 to 12.50
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Youngstown

Numerous Holiday Week Suspensions—Bar Iron Mill Wages Advanced

YOUNGSTOWN, July 2.—Iron and steel production schedules in the Mahoning Valley reach a low point of the year in this week, because of suspensions for the Independence Day observance. All of the non-integrated sheet rollers in the upper-Mahoning Valley area will be idle for the week.

The Republic Iron & Steel Co. will operate its strip mills at the Warren property, but its sheet and tin plate units will be idle. Operation of finishing mills of the Youngstown Sheet & Tube Co. will be at a low ebb. The Carnegie Steel Co. suspends for the Fourth only, resuming Thursday with 75 per cent operations. Some finish-

ing mills will remain idle until Thursday morning, when they will be started. The A. M. Byers Co. will operate its Trumbull county plants three turns for three days, with puddle mills at 55 per cent. Sharon Steel Hoop Co. suspends for the entire week.

The Newton Steel Co., maker of highly finished steel sheets used largely in the automobile trade, suspends the week of the Fourth for repairs and overhauling. The company still has a considerable volume of unfilled business on its books. Earnings the first four months were at the annual rate of \$10 per common share.

Steel companies will take advantage of the suspensions to make the usual needed mid-year repairs to rolling mill equipment and to furnaces.

For July-August, tonnage rates paid boilers and finishing hands in mid-Western puddle and rolling mills

advance 1½ per cent, as a result of the bi-monthly settlement in Detroit. The average selling price of bar iron shipped during the 60 days ended June 20 was disclosed at \$1.90 per 100 lb., as compared with \$1.85, at the previous examination of sales sheets.

Canada

Demand for Foundry and Malleable Pig Iron Improves— Structural Steel Outlook Promising

TORONTO, ONT., July 2.—During the last week of June the demand for foundry and malleable pig iron in the Canadian markets improved. Developments centered chiefly around third quarter contract placing, and a number of good orders were taken. It is estimated that about 60 per cent of the regular contract buyers are covered to the end of September, and about 10 per cent of the remainder have placed contracts to take care of their needs to the middle of August. Third quarter contracts were closed at prevailing prices, and at the moment there is little prospect of advances. Spot sales are being maintained at a steady level. Spot demand during June compared favorably with that of April and May. Prices are firm but unchanged.

Prices per gross ton:

	Delivered Toronto	
No. 1 fdy., sil.	2.25 to 2.75	\$23.10 to \$23.60
No. 2 fdy., sil.	1.75 to 2.25	23.10 to 23.60
Malleable		23.10 to 23.60
	Delivered Montreal	
No. 1 fdy., sil.	2.25 to 2.75	24.50 to 25.00
No. 2 fdy., sil.	1.75 to 2.25	24.50 to 25.00
Malleable		24.50 to 25.00
Basic		23.50 to 24.00
	Imported Iron, Montreal Warehouse	
Summerlee		33.50
Carron		33.00

Structural Steel.—Improvement in business has followed the return of structural steel workers to their jobs. Delivery on old contract account has been resumed and many buildings that were held up are now going ahead and builders are trying to make up for the time lost. A strong demand is reported for structural steel and reinforcing bars in the Toronto and Montreal markets. Orders for upward of 5000 tons were closed during the week and between 25,000 and 40,000 tons is pending. For an office building to be erected by L. J. Wookey, Foy Building, Toronto, 3000 tons of structural steel will be required. Approximately 4000 tons of structural steel and 2000 tons of reinforcing bars will be needed in connection with building program for the Royal Hotel and Terminal Syndicate, Hamilton, Ont., of which F. G. Engholm, Bloor Building, is engineer. For the proposed printing plant at Calgary, Alta, for the Alberta Publishing Co., 1000 tons of structural steel and 500 tons of reinforcing bars will be needed. The Dominion Bridge Co., Winnipeg, Man., and the Hamilton Bridge Co., Hamilton, Ont., have the contract to supply approximately 6000 tons of structural steel for the new assembly plant at Regina, Sask., for General Motors of Canada, Oshawa, Ont.

Old Material.—With the exception of a few orders for third quarter delivery, business shows practically no change from that of the past week or two. Some interest is shown in materials for third quarter, but the majority of consumers prefer the hand-to-mouth method of buying. Orders for steel scrap from the Hamilton, Ont., district ran a good tonnage during the week, and several large orders for machinery cast, malleable scrap and wrought iron were received from

buyers throughout the province. In the Montreal market dealers report a steady demand for heavy melting steel, machinery cast, wrought iron and steel axles and standard car wheels. For the fiscal year ended March 31, exports of iron and steel scrap totaled 76,147 tons, compared with 68,395 tons for the corresponding period ended March 31, 1927.

Dealers' buying prices:

	Per Gross Ton	Toronto	Montreal
Heavy melting steel.....	\$9.00	\$7.00	
Rails, scrap	10.00	9.00	
No. 1 wrought.....	9.00	11.00

Boiler plate	7.00	6.00	
Heavy axle turnings....	7.50	6.50	
Cast borings	7.50	5.00	
Steel turnings	7.00	5.50	
Wrought pipe	5.00	5.00	
Steel axles	14.00	20.00	
Axles, wrought iron....	16.00	22.00	
No. 1 machinery cast....		16.00	
Stove plate		13.00	
Standard carwheels		16.00	
Malleable		13.00	
	Per Net Ton		
No. 1 machinery cast....	15.00		
Stove plate	9.00		
Standard carwheels	13.00		
Malleable scrap	13.00		

Detroit

Not Meeting Usual Summer Slump in Automobile Demand —Oakland to Expand Foundries

DETROIT, July 2.—Automobile production totals for June will differ probably not a great deal from May figures, some companies increasing production slightly and others slowing off somewhat.

Industrial employment in this area, according to the Employers' Association Index under date of June 19, fell off 273 from the figure of the week previous. The total as of June 19 stands at 263,197, which includes two-thirds of the city's working population. This figure compares with 191,303 in the corresponding week a year ago.

The production totals for the first five months of this year for Cadillac Motor Car Co. stand at 17,437 units, which is an increase of 39 per cent over the production for the similar period of 1927.

Charles F. Barth, general manager, announced June 26 that the minimum production scheduled by the Chevrolet Motor Co. for July, August and September had been set at 100,000 cars a month, as his company had failed to meet the usual buying slump noted at this time of year. The highest single day's production of Chevrolet units was attained May 28, with a score of 7075. It is certain that the Chevrolet company in the first half of 1928 will show the greatest production in its history.

The Ford Motor Co.'s production of model A stands somewhere between 2800 and 3000 units per day. The highest single day's production was that of June 11, showing in excess of 3000 units. For the week ended June 20, Ford company's employment showed 115,967, a decrease from the week previous, when the total stood at 117,200.

An additional group of foundry buildings will be constructed at Pontiac by the Oakland Motor Car Co., as increased capacity for Oakland and Pontiac cars. Work on this group will start immediately and will include six buildings, totaling 200,000 sq. ft. of floor space. The foundry unit will employ about 700 men.

The Packard Motor Car Co. has closed down for its vacation period of two weeks. Changes and alterations will be made to increase capacity over the standard figure of 4600 cars a month.

The weekly output of Willys-Overland Co. for the last three weeks has exceeded 10,000 units. This company enters July with approximately 20,000 unfilled orders on the books.

General Motors' sales for the current quarter have been in excess of 200,000 units a month. May sales stand at 207,325 units, with March and April just below the 200,000 mark. Sales for the first six months are better than 1,000,000 units.

The truck division of Dodge Brothers, Inc., reports 3000 unfilled orders for the new six-cylinder line, and production schedules have been increased.

The Fisher Body Corporation set a new high record for production on April 20, with a daily output of 7280 bodies.

Auto-body sheet stands at 4c., Pittsburgh, with blue annealed sheet from 2 to 2.10c., Pittsburgh. Cold finished bars are quoted at 2.10c., Pittsburgh, hot rolled 3 in. and narrower, 2.20c. to 2.30c., Pittsburgh, 3 to 6 in., 1.85c. to 2.10c., Pittsburgh,

with 6 in. and wider, 1.75c. to 1.90c., Pittsburgh. Bars, plates and shapes remain at 1.85c. to 1.90c., Pittsburgh.

There have been no large sales of scrap during the past week. Shipments by producers in July will be below those of last month. Prices are as quoted week ago.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:	
Hvy. melting and shov. steel	\$11.00 to \$11.50
Borings and short turnings	7.00 to 7.50
Long turnings	5.75 to 6.25
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets	9.75 to 10.25
Stove plate	11.00 to 12.00
No. 1 busheling	8.50 to 9.00
Sheet clippings	6.00 to 6.50
Flashings	9.00 to 9.50

Cincinnati

Pig Iron Business Almost at Standstill But Steel Buying Improves in Spots

CINCINNATI, July 2.—Weakness in prices and the usual seasonal decline in foundry operations have had a depressing effect on pig iron sales, which have been almost at a standstill. The only sizable order in the past week was for 500 tons of foundry iron for the Louisville & Nashville. With the exception of an inquiry for 2000 tons of foundry iron from a Hamilton, Ohio, melter, pending business is of little consequence. Southern iron is quoted at \$15.50, base Birmingham, but users are reluctant to make forward purchases in view of the uncertainty regarding the trend of their production in the next two months and of the likelihood that they may buy at the present price throughout the third quarter. Southern Ohio iron is selling at \$18, base Ironton, with occasional dips of 50c. a ton. Lake Erie furnaces are reported to be accepting orders in competitive territory at from \$16 to \$16.50, base furnace. Jackson County silvery is unchanged at \$25, base Jackson, for 8 per cent.

Prices per gross ton, deliv'd Cincinnati:	
So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.19
Ala. fdy., sil. 2.25 to 2.75	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—The underlying tone of the market is slightly stronger than a week ago, although specifications against old contracts still are lagging somewhat and consumers are hesitant about signing third-quarter contracts for bars, structural shapes and plates at the new schedule of 1.90c., base Pittsburgh. Steel companies report that from 30 to 40 per cent of their customers have signed up for their requirements over the next 90 days at that figure. Sales of bars have been holding up well, and much of the tonnage has been taken by agricultural implement manufacturers, who are operating practically at capacity. Structural steel has been quiet, because of the dearth of sizable jobs in this district. In fact, most fabricators have been compelled to curtail production on account of the lack of orders. While prices of sheets have not dropped further in the past week, the situation has not improved. Galvanized sheets for roofing purposes

are selling in the South at from 3.30c. to 3.50c., base Pittsburgh, with 3.40c. prevailing as a common average. On metal furniture sheets mills have quoted 3.85c. to 3.90c., base Pittsburgh, on No. 24 gage, A grade, but have made concessions of from \$2 to \$3 a ton to large users. Blue annealed and automobile body sheets, on the other hand, have been fairly well stabilized at 2c. and 4c., base Pittsburgh, respectively. Bookings of district mills have approached 80 per cent of capacity, while operations are being carried on at about 90 per cent. Specifications from the automobile industry have been sustained at a satisfactory rate, and demand for special enameled stock has been good. There has been a recession in orders for wire goods, the decrease being largely of a seasonal character. Common wire nails continue to be quoted at \$2.50 per keg, base Ironton, and plain wire at \$2.40 per 100 lb., base Ironton.

Reinforcing Bars.—The Pollak Steel Co. will supply 188 tons of rail steel bars for an addition to the plant of the Andrew Juergens Co., Cincinnati, and 133 tons for a building to be erected in Detroit by the Swift Packing Co. Awards of from 25 to 100 tons of bars have been numerous. Prices are firm, with new billet bars quoted at 1.85c. to 1.90c., base Pittsburgh, and rail steel stock at 1.80c., base mill.

Warehouse Business.—Sales in June were slightly better than those during May, although two important jobbers report a falling off in business in the past month. Soft steel and iron bars lead in volume of orders, with

Warehouse Prices, f.o.b. Cincinnati

Base per Lb.	
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforce. bars	3.15c.
Rail steel reinforce. bars	3.00c.
Hoops	4.00c. to 4.25c.
Bands	3.95c.
Cold-fin. rounds and hex	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'd sheets (No. 10)	3.60c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'd wire, per 100 lb.	\$3.00
Com. wire nails, base per keg	2.95
Cement c'd nails, base 100 lb. keg	2.95
Chain, per 100	7.55
Net per 100 Ft.	
Lap-weld. steel boiler tubes, 2-in.	\$18.00
4-in.	38.00
Seamless steel b'l'r tubes, 2-in.	19.00
4-in.	39.00

structural shapes and plates closely following. Demand for steel boiler tubes and for steel pipe has been fair. There has been no change in prices. The decline in sheet quotations in other markets has not affected schedules locally, and jobbers are of the opinion that present prices are not likely to be disturbed.

Coke.—For shipment from Ashland, Portsmouth and Indianapolis, by-product foundry coke will remain at \$7 per net ton, f.o.b. ovens, during July. Domestic grades also will be unchanged, with egg size at \$4.50, ovens, walnut, \$3.50, and No. 2 nut, \$3. At Detroit, by-product foundry coke is selling this month at \$9, delivered in the local switching district, and for outside shipment the average delivered price is \$10. Domestic coke in egg and nut sizes continues at \$5.50, ovens, for delivery outside of Detroit and at \$6, delivered in Detroit. The Louisville & Nashville has purchased 480 tons of beehive foundry coke from a Wise County producer. The Procter & Gamble Co., Cincinnati, is inquiring for 5000 tons of furnace coke for its local plant. Shipments of by-product foundry in June were about 5 per cent less than in May.

Foundry coke prices per net ton deliv'd Cincinnati: By-prod. coke, \$9.02; Wise County coke, \$7.09 to \$7.59; New River coke, \$9.09 to \$9.59. Freight rates, \$2.14 from Ashland, Ky.; \$2.59 from Wise County and New River ovens.

Old Material.—Consumers are buying sparingly, although a pick-up in sales is expected in the next two weeks. Cast iron borings, machine shop turnings and cast iron carwheels are down 25c. a ton, but other items are holding firm. Railroad lists closing this week include the New York Central, 8000 tons, Virginian, 800 tons, and Big Four, 2200 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	\$10.75 to \$11.25
Scrap rails for melting	11.25 to 11.75
Loose sheet clippings	8.25 to 8.75
Bundled sheets	9.25 to 9.75
Cast iron borings	7.50 to 8.00
Machine shop turnings	7.00 to 7.50
No. 1 busheling	10.00 to 10.50
No. 2 busheling	6.00 to 6.50
Rails for rolling	12.50 to 13.00
No. 1 locomotive tires	12.75 to 13.25
No. 1 railroad wrought	10.00 to 10.50
Short rails	15.75 to 16.25
Cast iron carwheels	12.00 to 12.50
No. 1 machinery cast	15.25 to 15.75
No. 1 railroad cast	12.75 to 13.25
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	11.50 to 12.00
Agricultural malleable	11.00 to 11.50

The National Industrial Conference Board, Inc., 247 Park Avenue, New York, has published a book entitled "Employee Stock Purchase Plans in the United States," which is the result of a comprehensive survey of all the different types of stock ownership systems that are or have been in use in the United States. The volume was prepared by Margaret L. Stecker and assistants under the supervision of the board's economic council. Companies engaged in the making of steel or fabrication of products from steel figure largely in the various plans discussed.

Non-Ferrous Metal Markets

Fairly Large Sales of Tin But Under Those of Preceding Week—Both Tin and Zinc Slightly Higher

Copper.—Demand continues exceedingly light both from foreign and domestic consumers and the week has been an uneventful one. Sales have consisted mostly of small lots. Quotations continue very firm, electrolytic copper being quoted at 14.75c., delivered in the Connecticut Valley, with Copper Exporters, Inc., still holding at 15c., c.i.f. European ports. Lake copper is quoted at 14.87½c., delivered, in a quiet but steady market.

*Refinery quotation; delivered price ¼c. higher.

Copper Averages.—The average price of Lake copper for the month of June, based on daily quotations in THE IRON AGE, was 14.87½c., delivered. The average price of electrolytic copper was 14.50c., refinery, or 14.75c., delivered in the Connecticut Valley.

Tin.—For the week ended Saturday, June 30, sales of tin were about 1200 tons, which is considerably lighter than the turnover of 1700 tons for the week previous. The interesting feature is that about half of the tin sold was taken by consumers. Toward the end of the week the tone of the market was better because many felt that the bottom had been reached. Today, Monday, this conviction was not quite so firm and the market was dull and

weaker, with spot Straits tin quoted at 46.12½c., New York. Prices in London today were considerably lower than a week ago, with spot standard quoted at £211 15s., future standard at £208 7s. 6d., and spot Straits at £214. The Singapore price today was £215 2s. 6d. Statistics for June show total deliveries into consumption in the United States at 6950 tons, with 2148 tons reported in stock and landing on June 30. The world's visible supply on July 1 was 16,231 tons, a decrease of 833 tons from the previous month. This was considered favorable in view of the large Straits shipments in June of 8516 tons. Banca shipments last month were small at 806 tons, and Chinese shipments were only 10 tons, which helped to create

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products have not changed since May 25. Zinc sheets have been quoted at 9.25c., base, since the advance of June 7, and lead full sheets at 10c. to 10.25c. since May 29.

Brass Rods	17.00c.	

a decrease in the visible supply. It is reported that the Banca shipments for the first half of July will be more than the June total. Another report today is that Straits shipments in July will reach 9000 tons, a factor in the weaker tone of the market today. Sales in the Far East, which have been conspicuous recently, were light last week, except on June 29, when they were about 400 tons.

Lead.—Prices are unchanged and the market has been quiet, with demand only moderate. The quotation of the leading interest continues at 6.30c., New York, as the contract price, with 6.15c., St. Louis, the prevailing level in the outside market.

Zinc.—Advance orders on the books of producers are reported to be the lowest in many months. It is pointed out that buyers of prime Western zinc are pursuing the familiar hand-to-mouth policy in the expectation of lower prices. Producers are making no concessions, quotations having advanced five points to 6.20c., East St. Louis, or 6.55c., New York. Both demand and inquiry are not large. Ore at Joplin was unchanged Saturday at \$40 a ton, at which about 7000 tons was sold, with production

about 11,000 tons, both practically unchanged from the week previous.

Nickel.—Wholesale lots of ingot nickel are quoted unchanged at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—Chinese metal is quoted unchanged at 9.50c. to 9.75c., New York, for all positions, with demand light.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 2.—Sales are individually small. Prices for copper are strong, but quotations on tin and antimony are lower. The old metal market is dull.

Prices, per lb., in carload lots: Lake copper, 14.75c.; tin, 48.50c.; lead, 6.25c.; zinc, 6.30c.; in less-than-carload lots, antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

OKLAHOMA CITY, OKLA., 650 tons, highway bridge.

Fabricated Structural Steel

Miscellaneous New York Jobs Take Nearly Half of 42,000 Tons Awarded—New Projects Will Require 28,900 Tons

MORE than 15,000 tons of the 42,000 tons of fabricated structural steel reported placed in the last week will go for miscellaneous work in New York, principally apartment buildings. Other large jobs placed were a power house at Mount Holly, N. C., calling for 3700 tons, and a Chicago high school, which will take 3500 tons. Outstanding among new projects, which call for 28,900 tons, are 4200 tons in a bridge for the Texas & Pacific Railroad, 3500 tons for a high school in Brooklyn and 3000 tons for a New York apartment building. Awards follow:

BOSTON & MAINE RAILROAD, 400 tons, bridges, to Boston Bridge Works, Inc.,

STATE OF VERMONT, 200 tons, highway bridges, to Bethlehem Steel Co.

NEW YORK, 13,700 tons, in the following awards as reported to the Structural Steel Board of Trade: Addition to Lord's Court Building at Exchange Place and William Street, bakery in Westmoreland Avenue at White Plains, N. Y., and apartment buildings at Madison Avenue and Seventieth Street, 171 East Seventy-ninth Street, 343 East Fifty-seventh Street, 317 East Fifty-seventh Street, Lexington Avenue and Seventy-fifth Street, Madison Avenue and Seventy-fifth Street, 200 East Sixty-eighth Street and 36 West Sixty-seventh Street, to Hedden Iron Construction Co.; alteration to Mechanics Bank at Court and Montague Streets in Brooklyn, synagogue at 721 West Eighty-third Street, and Brooklyn Eye and Ear Hospital at Grand Avenue and Cumberland Street, to George A. Just Co.; Roerich Museum at Riverside Drive and 103rd Street, to Taylor-Fichter Steel Construction Co.

NEW YORK, 500 tons, professional building on East Sixty-first Street, to Bethlehem Steel Co.

BROOKLYN, 1000 tons, theater, to Hedden Iron Construction Co.

JERSEY CITY, 500 tons, building for Pennsylvania Railroad, to Belmont Iron Works.

DEERWATER, N. J., 6000 tons, power station for United Gas Improvement Co., Philadelphia, to McClintic-Marshall Co.

ALLENTOWN, PA., 180 tons, Bell Telephone building, to Lehigh Structural Steel Co.

PHILADELPHIA, 660 tons, dormitories at Girard College, to American Bridge Co.

PHILADELPHIA, 645 tons, building for Drexel Institute, to American Bridge Co.

STATE OF NEW JERSEY, 135 tons, bridge, to Phoenix Bridge Co.

BALTIMORE & OHIO RAILROAD, 250 tons, bridges, to American Bridge Co.

SPARTANBURG, S. C., 1000 tons, building for Drayton Mills, to Carolina Iron & Steel Co.

MOUNT HOLLY, N. C., 3700 tons, power house for Duke Power Co., to Ingalls Iron Works, Birmingham.

WATERSVILLE, N. C., 250 tons, hydroelectric plant for Phoenix Utility Co., to Ingalls Iron Works Co.

LOUISVILLE, KY., 250 tons, caissons for bridge across Ohio River, to St. Louis Structural Steel Co.

PITTSBURGH, 1100 tons, Pittsburgh Coal Co. washer building, to Pittsburgh Engineering & Construction Corporation.

MASSILLON, OHIO, 120 tons, manufacturing building for Central Alloy Steel Corporation, to Massillon Bridge & Structural Co.

TOLEDO, OHIO, 300 tons, Nurses Home, to American Bridge Co.

IRONWOOD, MICH., 500 tons, stockpile

Japan Expands in Manchuria

To Build Oil Shale Recovery Plant at Fushun—Anshan Works Projects Blast Furnace

IN view of the political situation in China and the prospects of an early difference of opinion between the Chinese Nationalists and the Japanese Government over control in Manchuria, something of Japanese investment in that territory and need for its resources is perhaps noteworthy.

The South Manchuria Railway Co., the most important Japanese interest in Manchuria, has recently received reports on the present status of oil shale and the iron industry of that country, from which the following has been taken: The annual production of crude oil in Japan proper amounts to only about 280,000 to 290,000 tons. The production of oil from shale excavated in Manchuria would mean, it appears, the prolongation of the life of Japan's crude oil production by 22 to 23 years, as the average consumption of the country is 1,700,000 tons of heavy oil.

The shale deposit at the Fushun collieries amounts to about 5,400,000,000 tons, with an estimated crude oil content of 5.5 per cent, and it is calculated that this deposit would provide a total of about 200,000,000 tons of heavy oil. This shale is not subject to oil recovery at present, but in January of this year it was decided to establish an oil refining plant at Fushun with an annual capacity for treating 1,360,000 tons of oil shale, about 4000 tons a day. Preparations are proceeding for completing this plant and by the end of July, 1929, the plant is expected to be completed. Meanwhile orders are being placed for machinery required in the various departments of the plant and for other construction work.

Anshan Works Expanding

To reduce Japan's dependence upon other countries for supplies of iron,

a program of expansion has been projected at the Anshan Steel Works in Manchuria, a plant owned by the South Manchuria Railway Co. An appropriation of 5,500,000 yen (\$2,640,000) has been made for construction in 1928 and 1929, which will increase the production of the plant from 200,000 tons of pig iron annually to about 280,000 tons.

The new construction includes the erection of a modern 500-ton blast furnace in addition to the two 300-ton furnaces now in operation. The old furnaces will have their capacities increased to 350 tons a day.

In this connection, it is noteworthy that while Japan has some coal, although not sufficient for all requirements, there is almost no iron ore available in the country. To supply the demand, iron ore is imported from Central China and the South Seas. The Anshan district in Manchuria, however, is exceedingly rich in iron ore with estimated deposits of 300,000,000 tons with an average metal content of 35 per cent iron.

REINFORCING STEEL

OUTSTANDING among new projects totaling 5000 tons, which have been reported during the last week, is a drainage improvement job at Los Angeles requiring 2300 tons. The following awards involve about 2300 tons:

BOSTON, 400 tons, North Station, to Barker Steel Co.
DEDHAM, MASS., 125 tons, bridge, to Barker Steel Co.
FALL RIVER, MASS., 100 tons, coal pocket, to Barker Steel Co.
LONG ISLAND CITY, N. Y., 250 tons, building for Bayonne Steel Ceiling Co., to Truscon Steel Co.
CINCINNATI, 188 tons, addition to plant of Andrew Juergens Co., to Pollak Steel Co.
DETROIT, 133 tons, building for Swift Packing Co., to Pollak Steel Co.
SEWICKLEY, PA., 150 tons, Pennsylvania Railroad work, to Kalman Steel Co.
CHICAGO, 280 tons, Chicago Woman's Club, to an unnamed bidder.
CHICAGO, 150 tons, Sacred Heart Academy, to Barton Spiderweb System.
CHICAGO, 125 tons, apartment building on Sherwin Avenue, to Concrete Engineering Co.
CHICAGO, 200 tons, Chapin Studios, to Joseph T. Ryerson & Son.
MASON CITY, IOWA, 100 tons of rail steel bars, industrial plant, to Republic Iron & Steel Co.
CHICAGO, 120 tons, of rail steel bars, Chicago Arms apartment building, to Concrete Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 300 tons, Packard Motor Co. service station addition.
CAMBRIDGE, MASS., 150 tons, hospital.
NEW YORK, 100 tons, Queens Vocation School at Queens Village, L. I.
CHICAGO, 100 tons, garage at Twenty-sixth Street and Michigan Avenue.

CHICAGO, 100 tons, factory building on Ogden Avenue.
CHICAGO, 250 tons, garage at Wabash Avenue and Harrison Street; Alfred S. Alschuler, architect.
CHICAGO, 300 tons, printing plant for William J. Igoe.
CHICAGO, 450 tons, Sheridan Towers.
CHICAGO, 450 tons, Harmon sports arena.
MILWAUKEE, 135 tons, bridge; bids close July 12.
ST. LOUIS, 380 tons, hotel at Twelfth and Locust Streets; McKelvey-Carter Construction Co., general contractors.
LOS ANGELES, 2288 tons, Drainage Improvement District No. 26; bids July 16.

British Market Depressed and Mills Urge Government Aid

LONDON, ENGLAND, June 22.—With the exception of one or two markets, particularly tin plate, there has been no improvement in the iron and steel industry. British steel makers are still pressing for some form of government aid, especially urging the inclusion of iron and steel under the Safeguarding of Industries act, and in this connection a deputation of steel makers waited on the Prime Minister on June 20. It was pointed out that the industry is operating on a day-to-day basis of 60 to 70 per cent of capacity, that of the material used in ship construction only about 20 per cent is foreign steel, and that upward of 80 per cent of the shipbuilders have adopted the British steel makers' rebate offer. Mr. Baldwin, however, again made it quite clear that the policy of the government would not be changed during the existence of the present Parliament, and referred the deputation to the government's relief of rates plan. At the same time the Chancellor of the Exchequer received

a similar deputation from the North East Coast, and promised to place the request before the Cabinet.

Meanwhile, demand is generally poor. With the exception of the Cleveland furnaces, the pig iron market is depressed. Cleveland makers, fortunately, have fairly well filled order books, but the volume of new business is not in proportion to the orders being executed.

In other districts, the situation is worse, and in Scotland three furnaces are being blown out, making less than 30 blast furnaces in blast out of a total of 100. Hematite iron is also depressed and makers are burdened with heavy stocks. On the northeast coast one more furnace has been blown out. Curtailment of output is the result of poor demand, as foreign iron is no longer competitive.

In semi-finished material conditions are better, as the Welsh makers of sheet bars are fully occupied in supplying tin plate mills and the market is strong because of the shortage of steel scrap.

The heavy steel industries are in a worse position than for some time. New shipbuilding contracts are negligible, and export demand for plates and shapes is at a low level. Lighter material is moving fairly freely, but the bulk of the tonnage needed is for the heavy mills. Business in Continental material has been on a small scale. What business has been done appears to have been transacted by the Continental mills direct with overseas buyers.

The David Joseph Co., Cincinnati scrap iron dealer, has decided to abandon its Cincinnati yards and is dismantling its equipment there. It will retain its yards at Youngstown, Portsmouth, Ohio, and Ashland, Ky.

PERSONAL

BLAINE S. SMITH has resigned as vice-president of the Universal Portland Cement Co. (Steel Corporation subsidiary) to become president of the Pennsylvania-Dixie Cement Corporation, succeeding John A. Miller, who becomes chairman of the board. Mr. Smith had been connected with the Universal Portland Cement Co. since 1908. In 1915 he was made general sales manager and later vice-president.

COL. HARRY C. WILDER, on Aug. 1, will resign as director of sales for the Northern New York Utilities, Inc., Rome, N. Y., and will join the Rome Wire Co. in charge of public utilities sales.

T. H. SCAFFE, for some time associated with the Detroit branch of the United States Electrical Tool Co., Cincinnati, has been appointed district manager in that city. R. N. Brayer, previously identified with the Boyer-Campbell Co., Detroit jobber, has been added to the Detroit personnel of the Electrical Tool company.

A. J. FORSCHNER, for some time sales manager in charge of the sand, gravel and stone department of the R. H. Beaumont Co., Philadelphia, has been appointed vice-president of the Atlas Conveyor Co., Inc., 20 South Fifteenth Street, Philadelphia. He was formerly president of the Alfred J. Forschner Co., distributor of power scrapers and slack line excavators. The Atlas company plans to extend its activities to include the manufacture of drag scrapers for excavating sand and gravel.

FRANCIS A. EMMONS, sales and advertising manager of the Foote Brothers Gear & Machine Co., Chicago, has been elected president of the Engineering Advertisers' Association of Chicago.

E. T. CORBUS, formerly with Edgar T. Ward's Sons Co., Boston, is now located at the Pittsburgh office, and has been succeeded in Boston by J. A. Parsons.

W. H. GERHAUSER has been elected president of the American Shipbuilding Co., Cleveland, to succeed Alfred G. Smith. Mr. Gerhauser has been vice-president and secretary of the company.

M. F. LIEBERMAN, Ambridge, Pa., was elected president of the Sheet Metal Contractors' Association of Pennsylvania at the annual convention, held at Erie, Pa. Emil Bordt, Lancaster, Pa., was named vice-president; Robert Warren, Erie, secretary, and Harry G. Hartline, Erie, treasurer. The 1929 convention will be at Lancaster.

H. A. WEBER, who has been district manager of sales in Boston for the Weirton Steel Co., has been transferred to New York as assistant district manager of sales in that office, and W. E. Snellgrove has been made Boston district manager of sales.

E. T. WEIR, who has been elected a director American Iron and Steel Institute, has been president Weirton Steel Co., Weirton, W. Va., since 1908, and has been active in the steel industry since 1890, when as a boy he entered the employ of the Braddock Wire Co., Braddock, Pa. Later he went to work for the Oliver Wire Co., Pittsburgh, and remained with that company until 1901, when he joined

ERNEST T. WEIR

the American Tin Plate Co., first as manager of its Monongahela works and later at its Monessen mills. In 1905, in association with J. R. Phillips, he organized the Phillips Sheet & Tin Plate Co. at Clarksburg, W. Va., of which he became president in 1908, the name of the company having been changed to the Weirton Steel Co. in 1918.

He is president of the Bank of Weirton, and a director of the Bank of Pittsburgh, National Association; Edgewater Steel Co., Oakmont, Pa.; Hanna Ore Mining Co., Cleveland; Redstone Coal & Coke Co., Brownsville, Pa.; Weirton Improvement Co.; Oak Hill Supply Co., located in the Monongahela Valley, and the Peoples Bank of Holidays Cove, W. Va. He is a member of United States Chamber of Commerce, the Pittsburgh Chamber of Commerce, American Iron and Steel Institute, Engineers' Society of Western Pennsylvania, Civic Club of Allegheny County, and the West Virginia Manufacturers' Association.

R. C. WALKER, formerly manager of the Meyer Furnace Co., Peoria, Ill., has been elected president and general manager of the Midland Furnace

Co., which is erecting a plant at Columbus, Ohio.

E. J. KEARNEY, secretary and treasurer of the Kearney & Trecker Corporation, Milwaukee, sailed for Europe on June 22.

MAURICE A. OUDIN, vice-president of the International General Electric Company, Inc., who has returned from an extended visit in Europe, was decorated with the Order of Commander of the Crown of Italy by the King of Italy in recognition of his good offices in behalf of a closer international relationship and of the specific benefit to the engineering profession of Italy.

L. P. LINDEMUTH, of Carney & Lindemuth, consulting engineers, 40 Wall Street, New York, has returned to the United States after nearly a year's absence in Australia. While there he was open-hearth consultant at the steel works of the Broken Hill Proprietary Co. at Newcastle, where L. P. Ross, formerly in charge of the furnaces at Wharton, N. J., has been carrying on blast furnace construction and operation for the Broken Hill company. Mr. Lindemuth sailed the portion of his return trip between Newcastle and the Fiji Islands in a 20-ton ketch, being accompanied by Stewart Keightley, for a number of years an officer in the Royal Australian Navy. The two started from Newcastle on March 3. The original plan was to make the entire voyage in the ketch from Newcastle to San Francisco by way of New Caledonia, Loyalty Islands, Southern New Hebrides, Fiji, Tonga, Samoa, Union Islands, Phoenix Islands and Honolulu.

J. RAMSEY SPEER has resigned the presidency of the Mackintosh-Hemp-hill Co., Pittsburgh. F. Hughes Moyer, vice-president in charge of operations, has been made executive vice-president and is to direct the affairs of the company. It is understood that new interests have become associated with the management.

WILLIAM J. OLCOTT has resigned as president of the Oliver Iron Mining Co., Duluth, operator of the Lake Superior iron mines of the United States Steel Corporation. He has been president of the company 19 years. Pentecost Mitchell, for many years a vice-president of the Oliver company and its operating head, has succeeded Mr. Olcott as president. J. H. McLean, a vice-president of the Oliver company, has also resigned. Continued poor health is given as the reason for the resignation of both officials. Prior to his connection with the Oliver Iron Mining Co., Mr. Olcott was general manager of the Lake Superior Consolidated Ore Mines, which were absorbed by the Oliver company.

STUART SMITH, formerly president of the Stuart S. Smith Co., San Francisco, has been appointed manager of the construction equipment division of the Jenison Machinery Co., recently

formed to succeed the northern California division of the Smith-Booth-Usher Co. He will serve as vice-president and director of the company and will have headquarters at 58 Fremont Street, San Francisco.

C. S. PROUDFOOT, Vanadium Corporation of America, Niagara Falls, N. Y., was elected president of the Association of Iron and Steel Electrical Engineers at the association's convention held recently in Chicago. Other officers elected were F. W. Cramer, Bethlehem Steel Co., Johnstown, Pa., vice-president; James Farrington, Wheeling Steel Corporation, Steubenville, Ohio, treasurer, and A. G. Place, Youngstown Sheet & Tube Co., Youngstown, secretary.

F. L. STONE has been appointed general sales manager of the Universal Portland Cement Co., Chicago, succeeding Blaine S. Smith who recently resigned to become president of the Pennsylvania-Dixie Cement Corporation. Mr. Stone started as a salesman with the Universal company 18 years ago. For the last ten years he has been assistant general sales manager.

F. C. YOUNG, who has been Cleveland district sales manager for the Union Drawn Steel Co., Beaver Falls, Pa., has been appointed assistant general sales manager of that company and has been succeeded in Cleveland by A. C. Geldner, who has been connected with the Cleveland sales office.

R. S. DUTTON, manager of sales for Pickands, Brown & Co., Chicago, has returned from a two months' vacation in southern Europe.

Institute Medal Committees Appointed

Rules governing the award of the Gary Memorial Medal and the American Iron and Steel Institute Medal, both of which were authorized at the last meeting of the institute, have been approved. The award of the Gary medal (gold), which will be awarded each year for outstanding achievement in the iron and steel industry, will be made by the directors of the institute upon recommendation of the following board of award: James A. Campbell, Willis L. King, James A. Farrell, Samuel Mather and Charles M. Schwab.

The American Iron and Steel Institute Medal, of bronze, will be awarded annually by the directors, on recommendation of a committee on arrangements, for a paper, read before the institute, having special merit and importance in connection with iron and steel manufacture. The committee on arrangements includes: James A. Farrell, chairman; James A. Burden, Eugene G. Grace, E. A. S. Clarke and John A. Topping.

OBITUARY

HJALMAR OSTERBERG, for many years special agent in the tin plate division of the Wheeling Steel Corporation, Wheeling, W. Va., died on June 25, aged 59 years. He was born in Sweden and came to this country when very young, obtaining work in the sheet and tin plate mills in the Pittsburgh district and finally becoming associated with the American Sheet & Tin Plate Co. Later he helped to organize the Osterberg Sheet & Tin Plate Co., Waynesburg, Pa. When that enterprise was abandoned in 1913, he became identified with the Wheeling Sheet & Tin Plate Co. as special sales representative, and had

been continuously associated with that company through its various mergers into the Wheeling Steel Corporation.

JAMES S. CAFFREY, one of the founders of the Smith & Caffrey Co., Syracuse, N. Y., died in that city on June 30, aged 75 years. William B. Smith, his associate in the formation of the firm 35 years ago, died on March 24. The company took over the old Phoenix foundry in 1911 and Mr. Caffrey became vice-president, having served in that capacity until his retirement five years ago. He was born in Providence, R. I., and located at Syracuse 50 years ago.

Metal Studies by Testing Society (Concluded from page 30)

num-base die castings. Results have already been received on 15,000 individual test pieces—in fact the data are so profuse that definite recommendations were withheld pending study by statistical methods.

Before active testing was commenced, much preparatory discussion was necessary to secure agreement on the list of alloys, and the size and shape of tension, impact and corrosion specimens to preserve the correct relation of surface to cross-section so important in die casting. Twelve aluminum-base alloys have been produced to the following chemical specifications:

Aluminum-Base Die Casting Alloys

	Copper, Per Cent	Silicon, Per Cent	Nickel, Per Cent	Iron, Per Cent	Aluminum, Per Cent, Balance
I	4	..	..	1½ to 2	94
II	10	..	..	1½ to 2	88
III	14	..	..	1½ to 2	84
IV	..	5	..	1½ to 2	93
V	..	13	..	1½ to 2	85
VI	2	3	..	1½ to 2	93
VII	4	5	..	1½ to 2	89
VIII	1½	¾	2¼	1½ to 2	94
IX	4	1½	4	1½ to 2	89
X	..	2	5	1½ to 2	91
XI	2	8	..	1½ to 2	88
XII	8	1	..	1½ to 2	89

It was also necessary to devise a usable method of hardness testing, and the committee has met this by a special Rockwell "E" scale, using ⅛-in. steel ball penetrator, and minor and major loads of 10 kg. and 100 kg., respectively.

At the Atlantic City meeting it was agreed to extend the program to cover zinc-base die castings, wherein various grades of zinc, ranging from the relatively impure Prime Western to electrolytic zinc of 99.90 per cent purity, Horsehead zinc of 99.94 per cent purity, and a special electrolytic zinc of 99.97 or 99.98 per cent. Such tests, especially the corrosion expo-

sure tests to be arranged, will do much to settle the question whether the instability of zinc-base die castings is due to lead and cadmium impurities.

Eventually it is hoped to have ample information about commercial die-cast metal, and its variation piece to piece and factory to factory, which will enable a specification to be written. While it is recognized that in die casting, as in all types of casting, a test piece gives merely a general indication of the quality of the metal in the actual casting, it is thought that when producing large quantities of important castings a special block can be slipped into the die at intervals and test pieces cast which will be of much control value to both producer and purchaser.

May Organize Lead Institute

Important interests in the lead industry have taken steps to organize a lead institute, similar in character to the Copper Institute. Discussions thus far have been informal, but a meeting of the leading interests may be held this month, at which details will be worked out with the idea of forming the institute in the fall.

One of the chief functions of the new organization will be to gather consumption data and other statistics to keep producers informed of the conditions of forward orders. Production statistics are already available.

Among the large corporations interested are the National Lead Co., the American Smelting & Refining Co., and the Western Electric Co., all of which are understood to have signified their intention of joining such an organization.

Unite to Cut Distribution Costs

(Concluded from page 18)

don't care what they pay that is reasonable, so long as they are assured that they don't pay a greater price than anyone else."

As a method for preventing ruthless price cutting, Mr. Schwab suggested the appointment of a committee to act as an arbiter, not so much to say what shall be made, but to watch what is being done. "Each company should report to that committee monthly or quarterly how much business he has done. Nothing need be said about price, but the monthly report of business done should be insisted upon. Occasionally someone will report more business than his position and the statistics of the past would warrant. Now if he has given his word that he is going to cooperate and does that, he is not cooperating and therefore is not a man to be taken into confidence as one who is doing a legitimate business.

"What does cooperation mean? Fifty men sit together and say that they are going to cooperate. The next day a good order comes along and someone goes out and takes it regardless of anybody's cooperation. If I understand the law correctly there is no reason why someone might say that the price of bolts and nuts is so-and-so. If other manufacturers want to cooperate there is nothing in the laws, as I understand them, that doesn't say that I can sell my goods at the same prices publicly announced that they will sell theirs. It is a question of personal confidence and relation with each other. You can go and cut your prices to get business if you like, but you will find when the end of the year comes round that you have not a greater percentage of the business than you would have had if you had gone ahead pursuing the normal tone and price of your business."

The progress made by trade association in bettering business conditions was emphasized by Gilbert H. Montague, general counsel National Welded Chain Association of the United States, in a talk on "Recent Steps in Business Self-Government." This progress, he pointed out, has been possible largely since 1925 when the Supreme Court rendered certain decisions making it possible for manufacturers to organize for the purpose of exchanging views and ideas concerning the conduct of their respective businesses. "Since that time," said Mr. Montague, "trade associations have grown to be second only to the national Government as governing bodies."

Committees Formed to Promote Distribution Plan

In the discussion which accompanied each session, it was clearly brought out that manufacturers and jobbers alike are heartily in favor of a distribution plan either similar to or patterned after the plan now used by the bolt, nut and rivet manufacturers. This sentiment was brought out by some 40 men representing jobbers in all parts of the country and manufacturers of a score or more distinct lines of products.

In order to investigate more thoroughly the possibilities of introducing the distribution plan used by the bolt and nut industry into other fields of manufacture, George Puchta, Queen City Supply Co., Cincinnati, suggested that two committees be formed, one to be made up of one representative of each of the several manufacturing industries represented at the meeting and the other to be composed of a number of the jobbers' chairmen from the various districts which have already been organized through the efforts of the bolt and nut industry. It was decided that these two committees should meet together for the purpose of considering plans for placing distribution on a more profitable basis. The personnel of these committees is included elsewhere in this story.

The possibility of arriving at manufacturing economies by comparing costs with those of competitors was stressed

by Mr. Schwab. "You will get all the advantages which the Steel Corporation has by reason of its variety of works, if you will just adopt the things they have naturally adopted by consolidation. No one would question the legality of that. If that is a great measure of economy and a great economic step forward, why is it not equally right for you who dispose of your products to discuss prices and conditions with reference to distribution? American manufacturers don't want to break the present law, but our business justifies our existence with the present law."

Business Analysis and Forecast

(Concluded from page 27)

of conditions represented by the P-V Line has been more quickly effective in the steel industry than was the case in 1923, the decline in ingot production coming about as soon after the decline in the P-V Line as it did in the early portions of 1924 and 1925. Parallelism between the two indexes is not sufficiently close to enable precise forecasts, but a further decline in production at a somewhat greater rate than usual for the season is indicated for the next two or three months.

The rate of changes in unfilled steel orders is an excellent barometer of the trend of business, its direction, or rise and fall, generally anticipating the course that business will take two or three months subsequently. The curve may hold close to its present low level for four or five months as it did in 1925.

Two of the great key industries of the country made a favorable showing in May. The automobile and building industries both increased more than usual for the month and were more active than in May of either of the two preceding years. If one were to allow for a normal rate of growth over a period of years, both industries would show activity at about the normal level. These facts explain both the well sustained volume of steel production and the large total volume of industrial activity. They do not, however, agree with the relatively unfavorable showing of railroad freight traffic, which runs considerably behind a year ago, and this fact leads us to infer that the automobile and building industries are somewhat ahead of the condition of the total for all industries.

The normal seasonal trend in both industries is rather sharply downward from now on, the decline carrying through September for building and through December for automobile production. In view of the current high money rates, some degree of political uncertainty, and the probable sagging trend of general business, it is probable that the two industries will fall off during the summer to a somewhat greater extent than usual for the season.

We Expect a Minimum Cost

(Concluded from page 7)

many manufacturers. They are suspicious that the products are sold below cost or without a fair margin of profit. I rather think that just the opposite is the fact. In general, the manufacturer who is forward looking and is quoting low prices usually has a very satisfactory margin of profit above his cost, as his annual statements show.

There is no reason to believe that the present tendency of lower selling prices will not continue and that we will not have this continual process of cost reduction and lower and lower selling prices. It is altogether proper that this tendency should continue, as it is on this basis that the prosperity of this country is based. Lower costs mean the possibility of each of us having more things, and that, after all, is what material prosperity is.

Fifth Largest Machinery Exports

May Total Was Exceeded in Only Four Previous Months,
All of Which Were More Than Seven
Years Ago

WASHINGTON, June 28.—Making a gain of \$7,294,784, or a little more than 19 per cent, exports of machinery in May were valued at \$44,670,652, against \$37,375,868 in April. For May of last year the value was \$35,791,991. For the five months ended with May, 1928, the value was \$196,649,126, an increase of \$19,117,419 or approximately 10% per cent over the total of \$177,531,707 for the corresponding period of last year. Only four previous months have exceeded the shipments made in May: June, 1919, with \$46,420,000; December, 1920, with \$50,322,000; January, 1921, with \$56,706,000; March, 1921, with \$45,796,000.

Exports of industrial machinery in May accounted to a substantial degree for the increased foreign shipments, being valued at \$20,274,976, a gain of approximately 17 per cent over exports of this class of equipment in April, valued at \$17,412,396. In May of last year exports of industrial machinery were valued at \$16,304,363. For the five months ended with May, 1928, an increase of almost \$5,000,000 was made over exports for the corresponding period of 1927, the respective totals having been \$89,173,624 and \$84,291,019.

Exports of power-driven metal-working machinery in May were valued at \$1,970,348, compared with \$1,827,938

Steady Gain in Machinery Exports Is Shown, After the Collapse of the 1920 Boom Had Spent Itself

in April, and \$1,494,498 in May of last year. For the five months ended with May the value was \$9,788,382, against \$7,231,825 for the corresponding period of last year. Exports of other metal-working machinery in May were valued at \$577,610, against \$397,842 in May of last year. For the five months ended with May of the present and last

Total	724	\$1,235,109	696	\$998,344

year the values were \$2,458,567 and \$1,908,965, respectively. As listed in THE IRON AGE table, exports of power-driven metal-working machinery numbered 724 units valued at \$1,235,109, against 696, valued at \$998,344, in April.

Total imports of machinery and vehicles in May were valued at \$2,424,688, a slight decrease under those for April, valued at \$2,427,259. For May of last year the value was \$3,389,320. For the five months ended with May the values were \$11,401,985 in 1928 and \$13,038,408 in 1927, showing a decrease of almost one-eighth for the five months

of the current year. Imports of industrial, office and printing machinery in May were valued at \$1,457,391, against \$1,378,840 in April; and \$6,684,804 for the five months ended with May of 1928, as compared with \$7,688,333 for the corresponding period of last year. Imports of machinery listed in THE IRON AGE table were valued at \$2,029,893 in May, against \$1,935,751 in April, and \$2,663,943 in May of last year. For the five months ended with May, 1928, and 1927, the values were \$8,706,883 and \$9,798,630, respectively.

Research and Market Study Needed in Steel

Future of Pittsburgh District Said to Depend on Laboratories, Sales
Departments and Quality of Personnel

“THE future of steel in Pittsburgh depends on the ability of the industry to maintain the necessary research, and to put the results of that research into production effectively,” declares Dr. Stephen L. Goodale, department of metallurgy, University of Pittsburgh, in the June issue of *Pittsburgh Record*, published by his college. “It depends also on a study of markets so that new conditions shall find our steel managements here prepared for them. Again, it depends upon maintenance of the high quality of the personnel engaged in steel production. If these conditions are met there need be no fear of a failure of sustained growth, and Pittsburgh will continue to be the greatest steel center of the country and probably of the world.”

The recent growth of steel capacity in the West, he points out, represents the building up of a very young industry and naturally has been relatively rapid compared with that in Pittsburgh. The steel industry at Pittsburgh, he states, will doubtless grow at a satisfactory rate when compared with the growth in other districts in the future.

Pittsburgh Can Lead in Research

• Pittsburgh has not lost any of its material advantages as a steel producing center, and it can expect to profit by the quality of its leadership and the momentum its industry has acquired during years of ascendancy, according to Doctor Goodale.

“There are three lines of effort along which study and planning will help—research, study of markets and living conditions,” he said.

“Pittsburgh is well supplied with research institutions. For example, at the Mellon Institute of Industrial Research more than a hundred problems are under investigation at this time; and a number of these have a direct bearing on the steel industry. The personnel of a number of different departments in our local collegiate institutions is usually engaged for at least a part of its time in the study of problems in the steel industry.

“The United States Bureau of Mines, in its Pittsburgh experiment station, is conducting important fun-

damental research work on the open-hearth process of steel making and on other problems of the steel industry. The American Sheet & Tin Plate Co., the National Tube Co. and the Aluminum Corporation of America are notable examples of large corporations which maintain separate metallurgical research laboratories in this district, and the Westinghouse Electric & Mfg. Co. also has an important metallurgical department in its large research laboratory. There are always a large number of research problems under investigation at the various plants of the steel companies, mostly of an immediately practical nature.

“There is still room for extensive additional fundamental research in the steel industry, as this industry in general is considerably behind the chemical and electrical industries in promoting research and in securing the advantages to be derived therefrom.

“In electrical engineering, the General Electric and Westinghouse companies, and a number of other successful organizations, have large and well planned research departments. They have spent much on problems of fundamental information, in addition to the research directed to solving questions of immediately practical application and importance. All of these interests have profited largely by the results of such work themselves, and have advanced the uses of electricity in the service of mankind.

Market Changes Require Study

“From time to time new developments of various kinds bring about major changes in the relationships between different industries and considerable shifting of the centers of locations of industries. Some new product is developed and to a large extent replaces products previously in use. For instance, one may cite bakelite, a product of research in chemistry, and aluminum and the alloys of aluminum which serve excellently for many uses in place of iron or steel. To this extent aluminum is a competitor of steel. Other light and strong metals, such as magnesium

and its alloys, are being actively developed.

“Steel producers need now more than ever before to study developments not only in steel but in other metals in order to plan ahead wisely to meet the competition that is forecast by such present developments.

Good Living Conditions Important

“If Pittsburghers wish to retain for this city its present steel supremacy one of the essentials required is that workers in steel shall find here good living conditions in terms of necessities and, in increasing measure, in terms of modern luxuries also. The large cities in our country are in direct competition for the best personnel in all walks of life.

“The whole community should join hands in a determined effort to keep Pittsburgh as good a city as can be in which to live. Economical and efficient administration of city and county affairs should be demanded, so that citizens shall receive the maximum in return for the heavy taxes which every great modern community demands of its people.”

Steel Cartel Quota Unchanged—New President Elected

WASHINGTON, July 2.—The International Steel Cartel will maintain its present quarterly production schedule of 7,321,750 metric tons of steel ingots in the ensuing three months and will make no change in over-production penalties, according to a preliminary announcement covering the results of the meeting of the entente at Düsseldorf, Germany, June 25, relayed by cablegram to the Department of Commerce by its commercial attaché in Paris.

It also was reported that Aloyse Meyer was formally elected president of the cartel to fill the vacancy caused by the recent death of Emile Mayrisch, first president. M. Meyer is director-general of the Acieries Reunies de Burbach-Eich-Dudelange in Luxemburg.

European Markets Generally Dull

Continental Quotas Unchanged—German Export Prices Reduced—Wales Expects Benefit from Delimited Export Markets—Antwerp Strike a Disorganizing Factor

(By Cable)

LONDON, ENGLAND, July 2.

Pig iron is dull and the outlook is unfavorable. Dorman, Long & Co., damped one Newport blast furnace, reducing the number of North-east Coast furnaces that are active to 34.

Only 27 Scottish stacks are now operating. Business generally is quiet and with the Glasgow Fair holiday approaching, little revival is anticipated before the end of August. Hematite iron is weaker on heavy stocks but prices are below cost.

Foreign ore is also quiet but Bilbao Rubio remains steady on the continuance of Swedish mines stoppage.

Finished iron and steel continue dull. Japan bought a few thousand tons of ship steel, and India placed some lines owing to the idleness of local Indian plant. But demand generally is poor and makers are operating part time only. Dorman, Long & Co. closed one Britannia steel furnace.

Continental iron and steel is quieter on the continued abstention of substantial buying, but market is likely to become disorganized if the strike of Antwerp dockers spreads as threatened.

The International Raw Steel Cartel

made no alteration in quotas for the third quarter.

Belgian pig iron output for May was 360,000 tons and that of raw steel 329,000 tons. Fifty-six blast furnaces were active at the end of May.

French production for May was 871,000 tons of pig iron and 794,000 tons of raw steel. On May 31, there were 150 furnaces in blast.

Welsh tin plate bars are firm on continued demand and a shortage of steel scrap. Tin plates are quieter

on the uncertainty of the tin market, but inquiry still is strong. Further important steps have been taken toward delimiting certain leading export markets, whereby Wales expects to receive substantial benefit and probably Welsh export prices will be raised.

There is an improved demand for galvanized sheets, especially from India and South Africa. Japan bought fair quantities of thick and thin gages of black sheets.

Germany Reduces Export Prices 25c to 50c a Ton

(By Radio)

BERLIN, GERMANY, July 2.

The international market is duller. Following the example of France and Belgium, Germany has reduced her export prices on rolling mill products by 1 to 2 shillings a ton.

The German home market is quieter. Demand steel has been reduced by increasing dullness in the engineering branches and by slowness in the revival of building.

June home prices of pig iron, semi-finished steel products and rolled products, including steel rails, are retained for July.

Production of both pig iron and

steel is declining. Mills producing bars are best occupied and have delivery terms averaging 2½ months. The market for tubes and medium and thin sheets is weaker.

Average Age of German Equipment Is Low

HAMBURG, GERMANY, June 16.—New plants, equipments and general machinery acquired by the German steel industry in the years following the war have brought the average age of machinery and furnaces down to a point where they compare favorably with other European producing countries. At the end of April there were

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.87 per £ as follows:

Durham coke, del'd....	£0 17½s.	to £0 17¾s.	\$4.27	to	\$4.33
Bilbao Rubio ore*.....	1 2½		5.48		
Cleveland No. 1 fdy.....	3 8½		16.56

Germany	6 1		1.34		

(a) Nominal.

109 furnaces in blast with an average age of 13 years. Steel furnaces show an average age of 16 years for the Thomas and only 9 years for the open-hearth furnaces.

General machinery and equipment in the steel industry have an average age of 14 years and machine tools of 8 years. The average age of equipment

in other industries, however, is better than in the steel industry. Among the wire makers, nail machines only average 7 years and wire drawing machinery is only 6 years. The general averages for other countries are about 170 per cent higher in Great Britain, 30 per cent higher in Belgium and 80 per cent higher in France.

Steel Export Association Operating

Recent Tin Plate Purchase by Japan Distributed to Five Mills— Importers Protest Shape Duty

NEW YORK, July 2.—The newly formed Steel Export Association, which is understood to include most of the independent mills as well as the United States Steel Products Co., is apparently functioning. On about 62,000 base boxes of oil can tin plate for the Nippon Oil Co., bids of American mills are understood to have been substantially the same and the business was awarded to the leading Japanese export houses in New York for execution by an American mill or mills. The various bidders on this tonnage reported themselves not in a position to accept more than a small portion of the total, so that the award was finally made on a basis of equal distribution to four of the bidders, United States Steel Products Co., Bethlehem Steel Export Corporation, Weirton Steel Co. and Jones & Laughlin Steel Corporation, and 3000 tons to the Wheeling Steel Corporation, which was the maximum that company was willing to accept.

Among buyers for export the impression seems to be that large contracts will probably be handled in a manner similar to the method used with the Nippon Oil Co. tin plate order. On smaller tonnages, the impression prevails that a mill may accept half the order, which would necessitate the buyer placing the remainder with another maker, or will take the entire tonnage, but refrain from quoting on a similar inquiry for the same material that might develop shortly afterward.

Association May Gain New Markets

Foreign traders are inclined to discount the report that the Steel Export Association is a combination to maintain a higher level of prices in export sales. It is pointed out that while there has been severe competition among American sellers seeking export business, orders have seldom been taken at a price that was lower than necessary to meet the competition of Continental mills. At present the United States is not a dominant factor in the sale of iron or steel to any foreign market of importance, and traders seem to believe that the new association, by distributing business in a single market among the various mills which it includes, will be able to institute a real effort to establish itself in that market with a

lower loss to the individual mill, as losses on such business will be better distributed.

With a market definitely secured for American mills, it is pointed out by foreign traders that producers here would be in a more tenable position than at present to suggest or receive the suggestion of an agreement with European mills bearing on the limitation of shipments of steel to the United States or to certain centers of consumption abroad.

Business with South America and Japan

Export business with South American markets is reported to be showing continued improvement, although orders are individually small. Japanese buying is light, but in addition to the award of tin plate by the Nippon Oil Co., the Kioto Oil Co. in Japan recently awarded about 3000 base boxes of a total inquiry for 12,000 boxes and is expected to return to the market soon for the remaining tonnage. Kioto municipality has awarded three miles of grooved and girder rails to a Japanese exporter and the order will be filled by an American mill. Tokio municipality has opened bids on nine miles of 91-lb. high T-rails and 100-lb. girder rails. A recent report from Japan states that the Kawasaki Dockyard Co. at Kobe, the leading black sheet producer of the country, will continue increasing its capacity for light gage black sheets and by 1929 expects to have a maximum production of 150,000 tons a year, compared with its present output of slightly less than 100,000 tons. The Government Works at Yawata is also planning a small increase in its black sheet output, so that it is estimated that with the Kawasaki mills turning out 150,000 tons of sheets annually the total for the entire country will be close to 200,000 tons.

Importers Protest Shape Duty

Importers of Continental steel in the United States, who are affected by the recent decision of the United States Treasury Department, which increases the duty on bar sized channels, angles and tees from 20c. per 100 lb., the structural rate, to 30c. per 100 lb., the duty on bars, have filed a brief with the Customs Court and action is expected this week. No decision on

the reclassification of reinforcing bars under a paragraph calling for a lower duty is expected until some time this fall.

An active movement of foreign steel is reported at present as some sizable tonnages of material have been arriving in the past week, which were bought some time ago when the market was at a lower level. When this material has been disposed of, a period of dullness seems to be expected, as very little purchasing has been done by importers here since the recent rapid advances in Continental steel prices. Meanwhile, in the past week European quotations have been reduced, the third small reduction in about three weeks, and plain steel bars are now offered at 1.80c. to 1.85c. per lb., base, delivered New York, with structural shapes at 1.61c. to 1.71c. per lb., base. Small sales of hot rolled strip steel and hoops are reported and importers claim that deliveries from Continental mills are rather less extended than a fortnight ago, when two to three months was the usual time offered.

Decline in German Exports and Imports in May

Showing a loss of 10,266 metric tons, or 2.8 per cent, exports of iron and steel products from Germany in May totaled 353,815 metric tons, compared with 364,081 tons in April, according to radiograms received from Berlin by the Department of Commerce, Washington. Imports in May were the smallest of the current year, amounting to 166,020 tons, compared with 190,527 tons in April, a decline of 24,507 tons, or approximately 12.8 per cent.

Of the 21 classifications in the export list, 12 showed decreases and nine increases in May. Exports of semi-finished steel declined to 47,829 tons from 54,706 tons, while the greatest reduction was in plain wire, which decreased to 27,797 tons from 37,188 tons. The greatest gain was in iron and steel bars, rods and angles, which increased to 87,448 tons from 76,968 tons. Of the 21 classifications in the import list, 13 showed declines in May. The outstanding decreases were in iron and steel bars, which dropped 10,126 tons to 63,931 tons from 74,057 tons, and in rails, which declined 6799 tons to 5784 tons from 12,583 tons.

Production of pig iron in Germany in May was 1,044,056 tons, a reduction of 1412 tons from the April total. Steel production increased to 1,247,781 tons, a gain of 86,376 tons. At the end of May there were 104 furnaces in blast, a decrease of three from the April total.

The Edgar Allen Steel Co., Inc., manufacturer of high speed, carbon and alloy tool steels, has removed its New York office to 741 Washington Street and its Chicago office to 21 North May Street.

Machinery Markets and News of the Works

Machine Tool Demand Remains Steady

June Buying at Same Rate as in May and Sales for First Six Months Considerably Ahead of Same Period of 1927—Exports Gain in May

BUSINESS in machine tools in June ran at about the same rate as in May. An unusually good month was experienced in the Chicago district, due for the most part to the large volume of sales to agricultural implement makers.

Sales during the first six months of 1928 are estimated as approximately 20 per cent greater than in the same period in 1927. Companies specializing in high-production equipment participated generously in the business available, and another noteworthy feature is that demand has been from widely scattered sources in the general industrial field.

Steady trend of the machine tool orders in the first half of this year is also reflected from the monthly Index of Machine Tool Orders compiled by the National Machine Tool Builders' Association. The net orders of 63 reporting companies in the first month of 1928 were the highest of any month since May, 1920. February orders were also at a high level and the March index showed a continued upward trend, the level reaching that of the summer of 1919. In April the volume of orders was again fairly heavy, but in May it was somewhat less than April, but not enough to turn the trend line downward.

Recession during the summer months is no doubt to be expected, although in some quarters it is believed that business will continue at a fair rate.

Exports of machine tools during May increased approximately 24 per cent as compared with April. The figures are: 724 machines valued at \$1,235,109 in May, as against 696 machines valued at \$998,344 in April. Engine, turret and other lathes to the number of 164 account for 31 per cent of the total value of the May exports, and cylindrical, internal and tool grinders, numbering 252, for about 30 per cent.

Demand from the automobile industry has been comparatively light in the past 30 days, although some activity developed in the Michigan district during the week, with the purchase by the Pontiac Motor Car Co. of a fair sized lot of production machinery. The Wright Aeronautical Corporation, which has been making purchases for some time, is in the market for equipment that is expected to total close to \$200,000.

New York

NEW YORK, JULY 2.—The two outstanding buyers of machine tools in this territory continue to be the Wright Aeronautical Corporation, Paterson, N. J., and the General Electric Co., Schenectady, N. Y. The Wright company, which has been quite a steady buyer for several months, is at present in the market for equipment that will probably total close to \$200,000. The General Electric Co. has been buying against a list of 60 or more items for its refrigerating machinery plants, and last week asked for prices on an additional list of 15 presses. In the Buffalo district, the Curtiss Aeroplane & Motor Co. has been buying a few tools and is in the market for further equipment.

Among the railroads, the New York Central has a substantial number of inquiries upon which bids have been submitted, and recently inquired for a 21-in. lathe. The Brooklyn & Manhattan Transit Co. is inquiring for a small engine lathe and a saw. While there has been a slight decline in the volume of inquiries from small users during the past week, the heavy buying in prospect from large companies continues of substantial proportions.

Sales of tools in past week have been well distributed among different types of machines. Lathes continue an important item, and Pratt & Whitney Co. reports orders for a total of 12 engine lathes, of which five 13-in. were for one company, four 16-in. for a second company and three 20-in. for a third.

Department of Plant and Structures, Municipal Building, New York, has taken out a permit for a three-story housing station and destructor plant to cost \$820,000, with power equipment, conveying, and other machinery; also for a two-story auxiliary building, 50 x 375 ft., ramp type, for conveying refuse, etc., to de-

structor station, to cost \$130,000 with equipment.

Greenwich House, 29 Barrow Street, New York, operating a vocational training school, will soon begin superstructure for three-story metal-working and wood-working shop at 16 Jones Street, to cost in excess of \$100,000 with equipment. Complete art metal-working tools and machinery will be installed. Delano & Aldrich, 126 East Thirty-eighth Street, are architects.

A. J. Thomas, 2 West Forty-sixth Street, New York, architect, will soon take bids on general contract for two-story automobile service, repair and garage building, 75 x 200 ft., to cost about \$100,000 with equipment.

Common Council, Albany, N. Y., has approved additional appropriation of \$100,000, making total fund of \$460,000, for municipal airport development, including hangars, repair and conditioning shops, oil storage and distributing stations and other buildings.

Hudson Hardware Co., 236 Main Street, Yonkers, N. Y., has asked bids on general contract for one-story storage and distributing plant on Saw Mill River Road, to cost close to \$50,000 with equipment. J. S. Bartley, 30 Fairview Avenue, is architect.

Jorgensen Brothers, Inc., 140 Lott Street, Brooklyn, operating an automobile repair works, has awarded general contract to Perri Contracting Co., 26 Court Street, for a one-story addition to cost about \$40,000 with equipment. George J. Lobenstein, 885 Flatbush Avenue, is architect.

M. Silverstein, 26 Court Street, Brooklyn, architect, will soon begin erection of two-story automobile service, repair and garage building, 120 x 250 ft., to cost approximately \$175,000 with equipment.

New York & Richmond Gas Co., 691 Bay Street, Stapleton, S. I., operating an artificial gas plant and system, is disposing of a preferred stock issue to total \$1,500,000, a portion of proceeds to be used for expansion and improvements. William J. Welsh is president.

Koeppen Metal Products, Inc., 361 Manhattan Avenue, Union City, N. J., operating a chromium plating works, has acquired property at Carlstadt, N. J., for erection of two-story plant, 80 x 350 ft., to cost close to \$70,000 with equipment. Present works will be removed to new location.

Mount & Robertson, Inc., 62 Broad Street, New York; cabinet manufacturer, has acquired plant at Boulevard and Ninth Street, West New York, N. J.,

heretofore used for textile manufacture, and will remodel for new factory.

P. D. Kinney, Newark, has taken out permit for a one-story machine repair shop at 59-61 Lock Street, to cost about \$25,000 with equipment.

American Can Co., 120 Broadway, New York, has plans for extensions and improvements in seven-story plant at Jersey City, to cost about \$40,000. A. B. Heiser is company architect.

Public Service Electric & Gas Co., Public Service Terminal, Newark, is arranging for sale of preferred stock issue to total about \$28,000,000, a portion of proceeds to be used for extensions and improvements in power plants, power switching stations, transmission lines, etc.

Frederic P. Humphreys, head of Fred-eric P. Humphreys, Inc., 347 Madison Avenue, New York, naval architect and

yacht builder, and associates have organized Humphreys Shipyard Corporation to build Diesel engine-driven yachts and similar seacraft. New company has acquired property of Monmouth Marine Railways, Keyport, N. J., for establishment of plant.

Steelcraft Coverator Co., Inc., 641 Lexington Avenue, Brooklyn, has been formed to make radiator cabinets and shields and kindred metal specialties. Plant at above address is equipped and in operation, but company is in market for steel furniture sheets, 12 to 24 gage, steel tubing, angle iron and metal grilles.

Gravity Separator & Equipment Co., 15 East Twenty-sixth Street, New York, has been organized to manufacture gravity separators and special equipment for separating water from oil, grease, tar or other fluids of varying specific gravity. Manufacturing is being done by contract and awards have been made.

has been appointed New England representative for Axmann Sand-Throwing Machine Co., Cleveland, manufacturer of sand-throwers and kindred equipment.

St. Louis

ST. LOUIS, July 2.—Arrangements have been made by Stifel, Nicolaus & Co., St. Louis, for purchase of Moloney Electric Co., with local plant at Kings-highway and Union Avenue, manufacturer of electric transformers, in which controlling interest heretofore has been held by American Brown Boveri Electric Corporation, 420 Lexington Avenue, New York. New owner has arranged for bond issue of \$1,500,000 a portion of proceeds to be used for expansion.

Universal Automobile Service Co., 633 North Grand Boulevard, St. Louis, has plans under way for six-story service, repair and garage building, to cost in excess of \$400,000 with equipment. Pleitsch & Price, Arcade Building, are architects.

Gruendler Patent Crusher & Pulverizer Co., 320 North Fourth Street, St. Louis, has purchased property at Glasgow and North Market Streets, and plans early construction of one-story machine shop, approximating 21,000 sq. ft. of floor space, to cost about \$50,000 with equipment.

Missouri Power & Light Co., Jefferson City, Mo., is disposing of bond issue of \$1,500,000, a portion of proceeds to be used for expansion in power plants and system.

Capital Garage, Inc., 1025 Wyandotte Street, Kansas City, Mo., will proceed with superstructure for a seven-story and basement service, repair and garage building, 125 x 130 ft., to cost in excess of \$200,000 with equipment. C. A. Smith, Finance Building, is architect.

Brandon Stove Co., East Markham Street, Little Rock, Ark., has filed plans for rebuilding portion of four-story plant, recently destroyed by fire, with loss reported at more than \$40,000 including equipment.

The International-Great Northern division of Missouri Pacific Railway is in market for a 90-in. heavy-duty driving wheel lathe for turning locomotive tires.

H. C. Peterson, Bankers' Reserve Life Building, Omaha, Neb., architect, will soon take bids for two-story automobile service, repair and garage building, to cost \$110,000 with equipment.

Following recent acquisition of Davis Boring Tool Co., Spring and Forest Park Avenues, St. Louis, Larkin Packer Co., 6200 Maple Avenue, manufacturer of oil well equipment and supplies, has begun erection of one-story addition, to be used largely for machine shop in connection with removal of acquired interest to that location, to cost about \$25,000.

Mapes Consolidated Mfg. Co., Tenth and Locust Streets, Kansas City, Mo., has authorized construction by day labor of one-story and basement machine shop, 56 x 80 ft., to cost about \$21,000 with equipment. John C. Lawrence, Commercial Building, is architect.

Plant and general offices of Scullin Steel Co., St. Louis, are at 6700 Manchester Avenue. Sales department only is located in Security Building, Fourth and Locust Streets.

East St. Louis Casting Co., Sixteenth Street and Kansas Avenue, East St. Louis, Ill., has plans for one-story foundry for furnace castings, to cost more than \$30,000 with equipment.

New England

BOSTON, JULY 2.—Comparatively few machine tools were sold the past week. Dealers were active, however, following up prospects which give promise of closing this month. It is reported that the Boston & Albany Railroad has bought some of the tools included in its list of about 25 machines, including radial drills and milling machines. The third list of tools for the Boston Hyde Park district school includes the following:

Two 14-in. x 6-ft. tool room lathes.	One 15-in. shaper.
One 13 x 30-in. geared-head lathe.	One 2½-in. radial drill.
One 1¼ x 8-in. turret lathe.	One 24-in. turret lathe.
One 20-in. shaper.	One heavy-duty geared-head engine lathe.
One 16-in. crank shaper.	Two 15-in. x 6-ft. engine lathes.

It is understood the city will purchase these machines, as well as others contained in two previous lists, some time this month. A manufacturer of electrical goods is in the market for a radial drill. Several textile mills have signified their intention of replacing machine shop tools within the next few months. This is the first time in more than a year the mills have evinced any interest in metal-working equipment. A New England machine tool builder is expected shortly to be in the market for some equipment.

Small tools are moving in good volume once more. The most active houses say there has not been a month this year when sales have not run ahead of those last year.

Hunt Spiller Mfg. Corporation, 383 Dorchester Avenue, Boston, has started work on a one-story, 40 x 70 ft. addition. Plans are private.

The city of Brookline, Mass., has awarded contract for alterations to its manual training school. Maurice P. Meade, 80 Boylston Street, Boston, is architect.

Albert Kahn, Inc., 100 Marquette Building, Detroit, is taking bids for a three-story, 117 x 234 ft., service plant addition for Packard Motor Car Co., Commonwealth Avenue and Melvin Street, Boston.

Nashoba Cold Storage Co., Ayer, Mass., has awarded contract for a cold storage plant. Motors and conveying equipment will be used. Haynes & Mason, 280 Main Street, Fitchburg, Mass., are architects.

York Ice Machinery Corporation, 200 Causeway Street, Boston, engineer, is preparing plans for a \$100,000 ice making plant for Ice Utilities, Inc., Fall River, Mass.

American Radiator Co., 120 Federal Street, Boston, has asked bids on general contract for one-story addition to plant at Somerville, 76 x 168 ft., to cost close to \$60,000 with equipment. William A. Dykeman, 10 Devonshire Street, is architect. Headquarters are at 40 West Fortieth Street, New York.

James Purdon, 50 Congress Street, Boston, architect, has revised plans for two-story automobile service, repair and garage building, 100 x 150 ft., to cost approximately \$110,000 with equipment.

In connection with expansion and im-

provement program, American Writing Paper Co., Holyoke, Mass., has approved plans for three-story beater room addition, 40 x 52 ft., and steam power house, 45 x 56 ft., to cost more than \$65,000 with equipment. Entire program will approximate \$500,000.

Plans are under way for establishment of municipal airport at Southington, Conn., including hangars, repair and recondition shops, oil storage and distributing building, etc. Site has been acquired in Plantsville section. Southington Exchange Club, Dewey S. Blakeslee, president, is in charge.

Public Service Co. of New Hampshire, Manchester, plans early construction of transmission line from recently acquired power plant at Bristol to Ossipee and Conway, N. H., about 35 miles, including switching station, substation, etc., to cost about \$100,000.

Henry G. Thompson & Son Co., New Haven, Conn., manufacturer of metal cutting saws and saw machines, has made arrangement with Bay State Saw & Tool Co., Winchester, Mass., by which it will manufacture Bay State line of hack saws. Bay State plant will be removed to New Haven and E. T. Bailey will continue as president.

Fafnir Bearing Co., New Britain, Conn., has let contract to Aberthaw Co., Boston, for erection of manufacturing building in addition to two other structures now under construction. It will be six stories, 60 x 290 ft.

W. Scott Thomas, 303 National Exchange Bank Building, Providence, R. I.,

Pittsburgh

PITTSBURGH, JULY 2.—For some machine tool dealers, June bulked fairly heavy in point of sales, but for most of them it was a rather lean month. Standard machines and tools did little, and it was special machinery that contributed largely to order books of some dealers whose business averaged well with earlier months of the year. Crane business is light, but there are few steel companies in this and nearby districts that are not figuring on improvements and asking for prices for estimating purposes.

Contract has been let by Pittsburgh Safety Glass Co., Frick Building, Pittsburgh, subsidiary of Pittsburgh Plate Glass Co., same address, to Mellon, Stuart & Co., Oliver Building, for new plant at Creighton, Pa., to cost approximately \$800,000 with machinery.

Board of Education, Ambridge, Pa., is considering installation of manual training equipment in addition to junior high school, to cost about \$180,000 with equipment. Bids will soon be asked on general contract by W. Ward Williams, 309 Fourth Avenue, Pittsburgh, architect.

Bids will be received by United

States Engineer office, Huntington, W. Va., until July 10 for 11,900 lb. button-head rivets; 218 steel buckle plates; 700 bolts and 32,053 lb. plates, circular 216

United States Corrugated Fiber Box Co., Seventeenth Street, Wheeling, W. Va., is said to be completing plans for an addition to cost in excess of \$85,000 with equipment.

Pittsburgh Parking Garage, Inc., 555 Sixth Avenue, Pittsburgh, has awarded general contract to Mellon, Stuart & Co., Oliver Building, for seven-story service, repair and garage building, 60 x 200 ft., to cost more than \$200,000 with equipment.

manufacturing plant, to cost close to \$70,000 with equipment.

Haverford Township School Board, Brookline, Pa., plans installation of manual training equipment in two-story addition to junior high school to cost \$200,000, for which plans are being completed by Boyd, Abel & Gubert, Otis Building, Philadelphia, architects.

Detroit

DETROIT, July 2.—Plans are under way by Automatic Products Co., 1145 West Grand Boulevard, Detroit, manufacturer of screw machine products, for one-story addition, 120 x 450 ft., to cost in excess of \$150,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects.

Belle Isle Creamery Co., 3600 East Forest Avenue, Detroit, has filed plans for two-story automobile service, repair and garage building for company trucks and cars to cost about \$90,000 with equipment. Williams & Coughlan, Kresge Building, are architects.

Flint Super-Speedway Airport, Inc., Flint, Mich., has secured permission to sell stock in amount of \$798,000, fund to be used for establishment of airport, to include hangars, repair and mechanical shops, oil storage and distributing buildings, and other units.

Verner, Wilhelm & Molby, Book Building, Detroit, architects, have plans under way for naval airport at Grosse Isle, Mich., consisting of metal hangars, machine and repair shops, administration building, oil storage and distributing building and other units.

Oakland Motor Car Co., Pontiac, Mich., has authorized plans for group of foundry buildings, comprising six one-story structures, totaling 200,000 sq. ft. of floor space, to cost more than \$500,000, with equipment. Company is also planning for installation of new chassis parts plant unit.

International Harvester Co., 606 South Michigan Avenue, Chicago, truck division, is said to be completing plans for one-story factory branch, service and repair building at Detroit, to cost close to \$100,000 with equipment.

V. J. Waier & Co., 2539 Woodward Avenue, Detroit, architects, have plans for three-story automobile service, repair and

garage building to cost upward of \$100,000 with equipment.

Grand Haven Stamping Works, Inc., Grand Haven, Mich., has completed arrangements for one-story addition, to cost more than \$25,000 with equipment.

Firestone Tire & Rubber Co., Akron, Ohio, has acquired property at Grand Rapids, Mich., and plans early erection of new factory branch and distributing plant, to cost about \$180,000 with equipment.

Marquette County Commissioners, Ishpeming, Mich., have plans for a new automobile service, repair and garage building for County motor trucks and cars, to cost about \$85,000 with equipment.

Contract for new General Motors engineering laboratory has been awarded to the Everett Winters Co., Detroit. It will be 12 stories, 210 x 231 ft., and will cost approximately \$2,500,000.

Great Lakes Chemical Works, Idaho Avenue at Detroit Terminal Railroad, Detroit, whose plant was destroyed by fire June 12, has moved into new quarters at West Jefferson Avenue and Junction Street and has installed equipment for production of Babbitt metal, solder, type metal and metal oxides, practically doubling former capacity.

Buffalo

BUFFALO, July 2.—Contract has been let by Carborundum Co., Buffalo Avenue, Niagara Falls, N. Y., to Laur & Mack, 1400 College Street, for a five-story addition, to cost in excess of \$85,000, with equipment. L. J. Call is company engineer.

American Cyanamid Co., Niagara Falls, Ont., with headquarters at 535 Fifth Avenue, New York, is arranging for increase in capital stock from 320,000 to 500,000 shares, to total about \$3,297,000, a considerable portion of fund to be used for extensions and improvements in plants at Niagara Falls and Warners, N. J., and for new plant on site lately secured at Linden, N. J.

George J. and Albert P. Ahles, 623 Roosevelt Avenue, Rome, N. Y., have organized Fort Stanwix Mfg. Co., capitalized at \$36,000, and plan early operation of plan for manufacture of tools, dies, jigs and kindred products.

E. B. Green & Sons, and Albert H. Hopkins, 1 Niagara Sq., Buffalo, architects, have plans for six-story automobile service, repair and garage building, to cost in excess of \$500,000 with equipment, to be owned and operated by Genesee Motoramp Garage, Inc., 93 Pearl Street.

Curtiss Aeroplane & Motor Co., Inc., Kail Street, Buffalo, is arranging for increase in capital from 300,000 to 600,000 shares of stock, no par value, a considerable portion of proceeds to be used for expansion and improvements, including construction of new plant units. A reconstruction program, arranged by previous financing is now under way, to cost approximately \$250,000.

D. H. P. Mfg. Co., Inc., Johnstown, N. Y., has been organized by Henry and Mitchell Denkert, 308 South Melcher Street, with capital of \$50,000, and contemplates early operation of plant for manufacture of water strainers, filters and kindred products.

Plans are being considered by Sealright Co., Inc., Fulton, N. Y., manufacturer of special sealed cardboard containers, etc., for a two-story addition to cost more than \$200,000 with machinery.

Philadelphia

PHILADELPHIA, July 2.—Property at 1202-10 Filbert Street, Philadelphia, has been purchased by Nevin Bus Terminal Co., Philadelphia, as site for multi-story service, repair and terminal garage, to cost in excess of \$180,000 with equipment.

Board of Education, Nineteenth and Ludlow Streets, Philadelphia, contemplates installation of manual training equipment in new four-story senior high school in Olney section, to cost close to \$500,000, for which plans will be drawn by Irwin T. Catharine, address noted, architect.

Thomas W. Swanger, 4607 Fern Hill Road, Philadelphia, and associates have organized Swanger Brothers Co., to operate local plant for manufacture of tools and machine specialties. William E. Swanger, Hackettstown, N. J., is also interested in new company.

Pennsylvania Salt Mfg. Co., Widener Building, Philadelphia, has authorized immediate construction of plant on 43-acre tract, recently acquired at Tacoma, Wash., to be operated by its subsidiary, Tacoma Electrochemical Co. Three buildings will comprise initial unit, totaling close to 30,000 sq. ft. of floor space, to cost more than \$200,000 with equipment. Entire project will cost approximately \$1,000,000.

Christian Gunther, Jr., 1618 Germantown Avenue, Philadelphia, and associates have organized Titgen-Eastwood Co., with capital of \$50,000, and contemplate early operation of plant for production of foundry equipment and supplies.

Department of Institutions and Agencies, Trenton, N. J., is completing plans for one-story industrial building at Colony for Feeble Minded, Vineland, N. J., to cost about \$100,000 with equipment. C. N. Leatham, State Office Building, is architect.

Tidewater Fertilizer Co., New Castle, Del., has acquired local industrial property and will remodel for new plant unit, with installation of electrically-operated machinery, conveying equipment and auxiliary apparatus.

Bethlehem City Ice Co., Bethlehem, Pa., care of Butz & Clader, 523 Hamilton Street, Allentown, Pa., architects, is having plans prepared for one-story ice-

The Crane Market

INQUIRY for overhead traveling cranes has declined somewhat in the past week or 10 days, but there is some good business still to be placed. Among recent inquiries is a request for prices on two 5-ton electric cranes from the Fairbanks Co., New York, for its plant at Binghamton, N. Y. The United States Hoffman Machinery Corporation, New York, is in the market for two small cranes and some monorail with hoists for its plant at Syracuse, N. Y. Inquiry for locomotive cranes is less active than a few weeks ago. Action seems to be expected soon on the list of cranes and steam shovels being inquired for by Dwight P. Robinson & Co. for export to South America.

In the Chicago district the Appleton Machine Co., Appleton,

Wis., is about to buy two 10-ton electric traveling cranes, and the Public Service Co. of Northern Illinois is in the market for a 15-ton and 35-ton electric traveling crane.

Among recent purchases are:

Montan Treating Co., Boston, a 15-ton, 8-wheel locomotive crane, reported purchased from American Hoist & Derrick Co.

Griffin Wheel Co., Chicago, three 1-ton wheel pitting cranes, through Page Sales Service, Chicago, from Milwaukee Electric Crane & Mfg. Co.

American Rolling Mill Co., Butler, Pa., a 25-ton overhead crane from Morgan Engineering Co.

Kitts Steam Specialty Co., Inc., Oswego, N. Y., manufacturer of valves, traps and steam specialties, has moved from 56 East Second Street to its new plant at West Second and Erie Streets.

Oswego Falls Corporation, Fulton, N. Y., has awarded contract to Austin Co. for two-story factory, 100 x 113 ft., at its Sealright branch, for manufacture of paper containers.

Gulf States

BIRMINGHAM, July 2.—Plans are being arranged by Texas Co., Texas Co. Building, Houston, Tex., for construction of pipe line from West Texas to Houston, about 470 miles, to cost close to \$10,000,000 with booster stations, etc. It is purposed to extend line shortly following from Houston to Port Arthur, Tex., about 90 miles, where main refinery of company is located.

Rome Electric Range Co., Rome, Ga., recently reorganized with capital of \$1,500,000, is planning removal of plant to Huntsville, Ala., where facilities will be provided for increased capacity.

Traders' Oil Mill Co., Fort Worth, Tex., plans one-story addition to cottonseed oil mill to cost \$25,000 with equipment.

Claiborne Parish School Board, Haynesville, La., is considering installation of manual training equipment in two-story and basement high school to cost \$200,000, for which bids have been asked on general contract. Edward F. Neild, City Bank Building, Shreveport, La., is architect.

Clyde Steamship Co., Pier 36, North River, New York, is said to be planning new cold storage and refrigerating plant at its pier at Miami, Fla., to cost about \$55,000 with equipment.

Texas Wire & Nail Mfg. Co., Galveston, Tex., is completing work on new plant and plans early operation; galvanized wire department will also be placed in service within few weeks. Plant will have capacity of about 2000 kegs of nails. 50 tons of galvanized wire, and about 100 tons barbed wire per day. Company has authorized installation of department for keg manufacture. Charles Jackson is plant superintendent.

S. S. Dutton Co., Sanford, Fla., is planning to rebuild its ice and precooling plant recently destroyed by fire, with loss in excess of \$100,000 including machinery.

Central Power & Light Co., San Antonio, Tex., plans extensions and improvements in La Palma power plant, vicinity of San Benito, Tex., including installation of 10,000-kw. turbo-generating unit and accessory equipment. Additions will also be made in transmission lines.

Board of Education, Port Arthur,

Tex., plans installation of manual training equipment in new two-story Thomas Jefferson High School, to cost \$400,000, for which bids will soon be asked on general contract. M. Lemmon, Construction Industries Building, Dallas, Tex., is architect.

James B. Clow & Sons, Inc., North Talman Avenue and West Lake Street, Chicago, manufacturer of plumbing equipment and supplies, pipe, etc., has acquired a controlling interest in Na-

tional Cast Iron Pipe Co., Birmingham, and contemplates expansion in facilities for increased production.

Pecos Valley Refining Co., Pyote, Tex., has approved immediate addition to gasoline refinery to cost more than \$125,000 with equipment.

Refining Castings Corporation, Dallas, Tex., has been formed to operate gray iron foundry, specializing in refinery castings. Contracts for building and equipment have been let.

Chicago

CHICAGO, JULY 2.—June closed as an unusually good month in the machine tool trade. The character of business, however, was quite different from a year ago at this time. In the first six months of 1928 only one major railroad list has been submitted to dealers in this district. In the absence of railroad business there has been a large volume of orders from agricultural implement manufacturers, a fair amount of which has been for replacement and plant betterment, and a large number of machine tools have been purchased for plant extensions, especially in tractor works. For several months there has been a good run of miscellaneous orders from scattered sources. Fresh inquiry from the railroads includes a 36-in. shaper for the Rock Island and a 36-in. boring mill for the Chicago, Burlington & Quincy. Used tools are in fair demand.

Contract has been let by Mills Novelty Co., 4110 Fullerton Avenue, Chicago, manufacturer of vending machines and parts, to Thomson & Son, 30 North La Salle Street, for a four-story addition, to cost \$175,000 with equipment. F. Rogers, 14 West Washington Street, is architect.

Board of Education, Decatur, Ill., plans installation of manual training equipment in new three-story junior high school, to cost \$300,000, for which bids will soon be asked on general contract. Brooks, Bramhall & Dague, National Bank Building, are architects.

R. B. Kurzon, 105 West Monroe Street, Chicago, architect, will soon take bids on general contract for three-story automobile service, repair and garage building, to cost about \$425,000 with equipment.

C. S. Card Iron Works Co., Denver, Colo., has plans for one-story addition to machine shop, 40 x 240 ft., to cost about \$23,000 including equipment.

Lubbers & Bell Co., North Second Street, Clinton, Iowa, manufacturer of hardware products, will proceed with work by day labor on one-story addition, 85 x 160 ft., to cost close to \$40,000 with equipment. A. N. Morrell, Clinton, is architect.

Halsam Products Co., 1801 Warren Avenue, Chicago, manufacturer of toys, etc., is completing new three-story plant, 35 x 125 ft., to replace a structure destroyed by fire several months ago.

Peoples Gas Light & Coke Co., 122 South Michigan Avenue, Chicago, has

awarded general contract to Ford & Phillips, 559 West Van Buren Street, for one-story meter building and laboratory, with repair and parts departments, testing division, etc., to cost in excess of \$50,000 with equipment.

William Robertson & Son, Chicago, manufacturers of high pressure lubricators, have moved their office and factory to 1424 North Halsted Street.

O. C. Keckley Co., Chicago, has acquired control of Lowerie Mfg. Co., Springfield, Ill., manufacturer of hydraulic presses.

Indiana

INDIANAPOLIS, July 2.—Contract has been let by Warner Gear Co., Muncie, manufacturer of automobile transmissions, to Albert J. Glaser, 610 South Jefferson Street, for a two-story addition, to cost about \$80,000 with equipment; also contract to Austin Co., Cleveland, for one-story machine shop, 150 x 250 ft., to cost approximately \$50,000 with equipment. R. P. Johnson is president.

DuBois-Robineau Furniture Co., Du Bois, has awarded general contract to Van Hoy Construction Co., Logansport, Ind., for rebuilding two-story factory recently destroyed by fire, to cost \$100,000 with equipment.

Certaineed Products Co., Anderson, manufacturer of roofing products, etc., will make extensions and improvements in plant to cost in excess of \$50,000 with equipment.

Board of Sanitary Commissioners, City Hall, Indianapolis, O. C. Ross, president, will receive bids until July 17 for centrifugal pumping machinery and auxiliary equipment for extensions in sewage disposal plant in Eagle Woods district. Charles H. Hurd, Merchants' Bank Building, is engineer.

Evansville Ice & Storage Co., 10 North Eighth Street, Evansville, has asked bids on general contract for two-story cold storage and refrigerating plant, to cost about \$65,000 with equipment. G. E. Wells, Inc., 100 West Monroe Street, Chicago, is engineer.

Truck Engineering Co., East Pontiac Street, Fort Wayne, has engaged Guy Mahurin, Standard Building, architect, to prepare plans for two one-story units at

motor truck equipment plant, to cost more than \$35,000 with equipment. Roy Spaulding is general manager.

Stanworth Tool Mfg. Co., manufacturer of counterbores, countersinks, end mills, reamers, etc., formerly at Indianapolis, is now operating in its new plant at Lebanon. Manufacturing space has been tripled, new equipment has been installed, and production has been considerably increased.

Taylor Brothers Mfg. Co., Elkhart, has been organized to manufacture grease guns, non-corrosive terminals and cables, cantilever tool boxes and measuring devices. Products will be manufactured by company or under contract, principally at plant of Indiana Aluminum Ware Corporation. C. E. Taylor is president of company.

Cincinnati

CINCINNATI, JULY 2.—Machine tool buying was sustained at a moderate rate the past week, with the result that sales in June closely approximated those in May. Three or four leading builders report that bookings last month were from 10 to 15 per cent better than in the previous month. On the other hand, a number of manufacturers noted a downward trend in orders. The tone of the market is healthy, and most executives are optimistic about the outlook for business during the summer. While a recession is expected, it is not likely that it will assume grave proportions. Several companies are of the opinion that purchases will continue at the present rate through July and August.

Sales in the first six months of 1928 were from 15 to 20 per cent ahead of those in the same period of 1927. It is worthy of note that those companies which have specialized in building high production tools are the ones which have made the best records during the first half of the year. Automobile makers have accounted for only a small percentage of the machinery sold in the last 30 days, most of the business having been placed by companies in the general industrial field.

Bids will be received by State Department of Public Welfare, Columbus, for new power plant and equipment at local Institution for Feeble Minded, as per plans and specifications at office of Herbert B. Briggs, Ohio-Hartman Building, State architect. Same department has plans under way for power plant and equipment, water supply and tunnel system at State institution at Apple Creek, to cost more than \$200,000, for which bids will be asked in August. J. E. Harper is director.

Constructing Quartermaster, Wright Field, Dayton, Ohio, will receive bids until July 20 for expansion joints.

Procter & Gamble Co., Gwynne Building, Cincinnati, has filed plans for addition to plant at St. Bernard, Ohio, comprising pumping plant, tank and tower building, and lime recovery unit, to cost about \$45,000.

United States Stove Corporation, South Pittsburg, Tenn., recently organized under Delaware laws, has acquired local plant and business of Wetter Mfg. Co., manufacturer of stoves, heating equipment, etc. New owner is disposing of bond issue for \$175,000, portion of proceeds to be used for extensions and improvements.

Atlantic Ice & Coal Co., 106 Collins Street, S.E., Atlanta, Ga., has plans for ice-manufacturing plant at Knoxville, Tenn., with initial output of 125 tons per day; a cold storage unit will also be built, entire project to cost in excess of \$150,000 with equipment. Engineering department is in charge.

Board of Education, Louisville, plans installation of manual training equipment in new three-story high school to cost \$235,000, for which plans have been filed. S. D. Jones is business director.

Cleveland

CLEVELAND, JULY 2.—Increased activity developed in the machine tool market in the Michigan territory the past week. The Pontiac Motor Car Co. purchased a fair sized lot of production machinery, and some other good business is pending from another automobile manufacturer. The market continues rather quiet in the Cleveland territory. There is some demand from manufacturers of automobile parts and tire molds, but orders are confined mostly to single tools. The Columbia Chemical Co., Barberton, Ohio, came into the market for a number of machines, but is understood to have purchased used tools from a Chicago dealer. Turret lathes continue to move well in single orders. Machinery business in June, on the whole, will show about the same volume as during May.

Plans are being drawn by the Federal Foundry Supply Co., 2639 East Seventy-ninth Street, Cleveland, for new one-story plant, 90 x 255 ft., to cost about \$130,000 with equipment. E. A. Welland & Co., 2725 Pittsburgh Avenue, are architects.

Radio Electric Co., Scienceville, Ohio, manufacturer of lighting equipment,

nickel-plated desk lamps, etc., has approved plans for one-story plant, 60 x 165 ft., to cost about \$50,000 with equipment.

Ohio Power Co., Canton, Ohio, will issue bonds in amount of \$6,333,000, and preferred stock for \$2,111,400, a portion of proceeds to be used for extensions and improvements.

Board of Trustees, Marsh Foundation School, Van Wert, Ohio, Dr. R. R. Reeder, director, is having plans drawn for new industrial arts building, to cost more than \$90,000 with equipment. Langdon, Hohly & Gram, Security Building, Toledo, Ohio, are architects.

Thompson Products Co., 2196 Clarkwood Road, Cleveland, manufacturer of bolts, nuts, etc., has awarded general contract to deHamel Construction Co., Plymouth Building, for one and two-story addition, 53 x 122 ft., to cost about \$55,000 with equipment.

White-Chevrolet Co., Zanesville, Ohio, local representative for Chevrolet automobile, is completing plans for three-story and basement service, repair and garage building, totaling about 45,000 sq. ft. floor space, to cost close to \$95,000 with equipment. W. S. Jameson, 31 North Fifth Street, is architect.

Cleveland Electric Illuminating Co., Illuminating Building, Cleveland, has acquired municipal light and power plant at Ashtabula, Ohio, and plans expansion and betterments, including construction of transmission lines for connection with present system, as well as other lines for power supply in Ashtabula dock district.

Steubenville Pressed Steel Co., Steubenville, Ohio, has been formed to manufacture and fabricate pressed steel products. Temporary quarters have been leased and company has begun manufacture of garage hardware.

Pacific Coast

SAN FRANCISCO, June 27.—H. W. Hull, 851 Monadnock Building, San Francisco, and associates have made application for permission to construct and operate a hydroelectric power plant on Independence Creek in Klamath National Forest, to cost in excess of \$200,000.

Diamond Hardwood Flooring Co., Los Angeles, plans rebuilding portion of mill destroyed by fire June 19, with loss more than \$80,000 including equipment.

Chaffey Union High School District, Ontario, Cal., is planning new vocational school unit in connection with high school group, to cost in excess of \$300,000. Allison & Allison, Hibernian Building, Los Angeles, are architects.

Board of Public Works, San Francisco, has granted appropriation of \$50,000 for addition to municipal car barns, for repair and garage service for motor buses used on system. M. M. O'Shaughnessy is city engineer.

Watsonville Ice & Cold Storage Co., Watsonville, Cal., is arranging an expansion and improvement program to cost \$250,000, including installation of equipment. Initial work will consist of extensions and betterments in power house to cost about \$75,000.

Union Pacific Railroad Co., Portland, has taken out permit for a one-story forge and blacksmith shop at its repair yards, to cost close to \$30,000 with equipment. Plans have also been completed for one-story flue shop.

Culmuck Furniture Co., Oakland, Cal., will rebuild portion of factory recently destroyed by fire, with loss estimated at \$65,000 including equipment.

Riverside Cement Co., Riverside, Cal., operating mills at Crestmore, near Riverside and at Oro Grande, Cal., is disposing of a preferred stock issue to total \$6,500,000, a portion of proceeds to be used for extensions and improvements. John Treanor is president.

Port of Seattle Commission, Seattle, has plans for a municipal grain elevator with capacity of 1,000,000 bu., to cost \$900,000, with elevating, conveying, screening and other machinery. Engineering department is in charge.

Jenison Machinery Co., 50 Fremont Street, San Francisco, has been formed to acquire good will and stocks of San Francisco office of Smith Booth Usher

Co., operating in northern California as distributor of machine tools, woodworking machinery, construction equipment, pumps, engines, motors and other products.

Hardie Mfg. Co., maker of spray and power pumps, has purchased site at Fifteenth and Northrup Streets, Portland, Ore., and will erect two-story brick and concrete building.

undertaken this summer. D. P. Cruikshank is vice-president.

Imperial Oil Co., King and Church Streets, Toronto, has purchased site on Ninth Avenue for establishment of a garage, office, warehouse, boiler house, barrel washing plant, light products pump house, etc., to cost approximately \$300,000.

Western Canada

Langley Electric Mfg. Co., Ltd., 677 Notre Dame Avenue, Winnipeg, is receiving bids, no closing date set, for a one-story addition, 66 x 100 ft.

Dominion Carton & Envelope Co., Edmonton, Alta., has let contract to L. F. Toby, 433 Tegler Building, for a one-story factory, 100 x 184 ft., to cost \$35,000. Architect is R. P. Blakey, 417 Empire Block.

Claydon Co., Ltd., 708 Confederation Life Building, Winnipeg, has been awarded contract for an addition, 305 x 317 ft., to Weston freight car shops at Winnipeg for Canadian Pacific Railway.

South Atlantic States

BALTIMORE, July 2.—Plans are being completed by International Harvester Co., Truck Division, 606 South Michigan Avenue, Chicago, for one-story factory branch, service and repair building at Baltimore, to cost close to \$115,000 with equipment. Bids will be asked on general contract.

Tidewater Oil Co., 11 Broadway, New York, with main refinery at Bayonne, N. J., has acquired tract of five acres, vicinity of Pennington Avenue and Baltimore & Ohio Railroad, Baltimore, for new storage and distributing plant, to cost more than \$350,000 with machinery.

United Railways Co., Continental Building, Baltimore, is having plans completed for one-story and basement motor bus service, repair and garage building, 195 x 400 ft., to cost in excess of \$150,000 with equipment. W. H. Emory, Jr., 18 East Lexington Street, is architect and engineer.

Lexington & Thomasville Gas Co., Thomasville, N. C., is considering construction of new central artificial gas plant, to cost more than \$150,000 with equipment.

Bids will be received by Chemical Warfare Service, Edgewood Arsenal, Md., until July 13 for one steam heated tray dryer with fan; one sifting machine; one grinding mill and auxiliary equipment, circular 120; until July 13 for one oxygen bomb-testing apparatus; one laboratory outfit, and one 12-in. recording hygrometer, circular 119.

Public Improvement Commission, Munsey Building, Baltimore, has plans for a

two-story storage and distributing plant for municipal service, to cost about \$375,000 with conveying, elevating and other equipment. J. E. Greiner, Lexington Building, is engineer.

McGowan-Motes Motor Co., 521 Broad Street, Augusta, Ga., will soon begin erection of one-story service, repair and garage building, 130 x 145 ft., to cost about 100,000 with equipment. Willis Irvin, S. F. C. Building, is architect.

District Commissioners, District Building, Washington, contemplate installation of manual training department in new E. A. Paul Junior High School, Brightwood district, to cost \$500,000, for which bids will soon be asked on general contract. A. L. Harris, District Building, is architect.

City Council, Shelby, N. C., has approved plans for extensions and improvements in municipal electric light and power plant, including installation of additional equipment.

Henry I. Grines, Asheville, N. C., architect, has filed plans for three-story automobile service, repair and garage building, 145 x 200 ft., to cost upward of \$100,000 with equipment.

American Chatillon Corporation, 393 Seventh Avenue, New York, has awarded general contract to McClintic-Marshall Co., Oliver Building, Pittsburgh, for rayon mill at Rome, Ga., to include power house, machine shop and other mechanical units, to cost in excess of \$3,500,000. Lockwood, Greene & Co., 1 Pershing Square, New York, are architects and engineers.

Canada

TORONTO, JULY 2.—Machine tool sales have fallen off the past week, but from recently announced programs of some industrial companies for plant extensions, prospects for an early resumption of buying are good. The automotive industry continues to buy for replacement and the General Motors of Canada, Oshawa, is having lists prepared for equipment for a new plant in western Canada and another in Ontario. A brisk demand is reported for small tools from mining fields of Ontario.

Construction has been started on a newsprint mill at Liverpool, N. S., for Royal Securities Corporation, Montreal. Work has also been started on a 20,000-hp. hydroelectric plant by Nova Scotia Power Commission to supply power for mill. Foundation Co. of Canada, Ltd., Montreal, has general contract for both mill and power plant.

Weaver Canadian Co., Ltd., Chatham, Ont., manufacturer of automobile jacks and pumps, garage equipment, etc., is having plans prepared for a new plant, 36 x 190 ft.

Bids are being received by B. A. Jones, architect, 14 Ontario Street South, Kitchener, Ont., for one-story addition, 50 x 125 ft., to plant of Galt Art Metal Co., 385 Dundas Street, Galt, Ont.

American Can Co., 2065 Jeanne d'Arc Street, Montreal, will build a five-story

addition to its factory, 130 x 200 ft. Company engineers have plans.

W. H. Wardwell, 1463 Union Avenue, Montreal, is preparing plans for a 10-story warehouse for Manufacturers Terminal Co., 1835 Ontario Street East, Montreal.

Bids will be called soon for a new plant on Coxwell Avenue for Service Station Equipment Co., Ltd., 510 King Street East, Toronto, manufacturer of gasoline pumps. It will be one story, 122 x 340 ft., steel and brick construction.

Ralston, Purina Co., Ltd., Main Street, Woodstock, Ont., has awarded contract to Harding Construction Co., Buffalo, for a five-story addition, 80 x 80 ft., to cost \$60,000.

Steel Equipment Co., Pembroke, Ont., is planning an addition to its factory to cost approximately \$70,000; work to be

Hell Co., 1131 Montana Avenue, Milwaukee, Wis., manufacturer of steel dump bodies, hydraulic hoists and tank equipment, etc., has placed general contract with Klug & Smith, consulting engineers, 69 East Wisconsin Avenue, local, for erection of a one-story addition, 74 x 302 ft. Inquiry is being made for miscellaneous equipment, including punches, shears, drills, shapers, lathes, etc. Hydro-Hoist Co., a subsidiary, recently was consolidated with Heil Co., and present enlargement is for benefit of both operations. Julius P. Heil is president, treasurer and general manager.

Modine Mfg. Co., 1700 Racine Street, Racine, Wis., manufacturer of automobile, truck and industrial radiators and coolings systems, will place contracts about Aug. 1 for additions costing approximately \$100,000.

Board of Education, Antigo, Wis., is taking bids until July 7 for a two-story addition, 52 x 74 ft., to Antigo Vocational Training School, to be used largely for metal and wood-working processes. Designer is Donald M. Schopeke, 125 Wausau Road, Antigo.

Hochenauer-Stresau, Inc., Milwaukee, has been organized to manufacture machinery, mechanical appliances and devices. Principals include Carl J. Hochenauer, 1510 Maryland Avenue, who has been a sales manager of A. O. Smith Corporations; R. S. Stresau and Leo Mann. Definite plans will be made public later.

Belle City Mfg. Co., Racine, Wis., manufacturer of individual threshing outfits, crawler attachments for tractors, etc., has taken over production and marketing of line of corn harvesting and husking machines heretofore made by Continental Mfg. Co., Springfield, Ohio. No important additions to plant or equipment will be made at this time, however.

THE IRON AGE

New York, July 12, 1928

ESTABLISHED 1855

VOL. 122, No. 2

Ford Uses Many Electric Furnaces

115 Forging and Heat-Treating Units in One Building—Several Types Used—Forming Ring Gears

BY FAY LEONE FAUROT*

PROBABLY the largest group of electric furnaces to be found in any one building in the world is in the Fordson plant of the Ford Motor Co. This big installation is in the spring and upset building. Here there are 115 electric furnaces using a total of about 20,000 kw. Seventy-six are operating in the spring department and 28 in the forging department, the remaining 11 being used on miscellaneous work.

Nickel-chromium in ribbon form is used as a resistor in those furnaces where the temperature does not exceed 1500 deg. Fahr. In some of the high-temperature furnaces troughs of carbide compound filled with pulverized carbon are used. Others are fitted with globar resistors, a non-metallic resistance element resembling silicon-carbide in appearance. Two of the furnaces use wire and one uses graphite for a heat source.

Alternating current is supplied at the building at 13,200 volts. From a substation it is carried to two distribution points, where it is transformed into 220 and 440 volts respectively. The 76 furnaces in the spring department are capable of handling 6000 rear springs and 12,000 front springs for the new Ford Model A, and 2500 springs for the truck, in two 8-hr. shifts. Two of the furnaces, on the

eye operation, are equipped with transformers which permit the voltage to be increased when it is desired to accelerate heating the springs.

Ford engineers say that the metal resistor type of furnace is long lived, simple and efficient. The form of its resistor makes it an easy matter to locate the heat source in any part of the furnace, or to have varying degrees of temperature in different parts of the same furnace. Elements composed of lengths of nickel-chromium on frames of fused aluminum oxide and fire clay are installed in floor, walls or ceiling of a furnace, or in any two or three of these places if desired. Thus heat may be put exactly where needed. When a break-down occurs these resistors may be removed easily through panels in the furnace walls, and repairs made in a short time.

Ribbon resistor-type furnaces have been operated for as long as a year without any apparent change in the area of the cross-section of the resistor or other deterioration of its structure. Ribbons of various cross-sections are used, those of common size being 0.03 x 1½ in.; 0.08 x 1½ in.; 0.08 x 1¾ in.; ¼ x 1¾ in., and 0.05 x 1¾ in. The usual combination alloy for temperatures up to 1900 deg. Fahr. is about 80 per cent nickel and 20 per cent chromium. In small laboratory furnaces the resistor is often in the form of a continuous wire.

The globar type of resistor is well regarded also, es-

*Mechanical engineer, 420 Lexington Avenue, New York.

At head of page is general view of one group of the electric furnaces in the spring and upset building at the Fordson plant.

pecially for those furnaces that operate at higher temperatures than 1500 deg. Fahr. For forging furnaces, where temperatures range from 2300 to 2400 deg. Fahr., the globar units give excellent results. They have been known to last 1000 to 1200 hr. and with further development it is said 2500 hr. will be possible. They are economical, easy to introduce into the furnace, rigid, strong and not liable to deterioration. They may be used for lower temperatures also, and of course give satisfactory results. The Ford Motor Co. engineers began experiments with globar resistors in 1925, but it was not until 1926 that the results achieved seemed to warrant their continued use. Since then, however, this form of resistor has been steadily gaining in favor.

The operation of the spring-forming machinery is interesting. Spring steel stock cut to proper size is put on a conveyor and carried through the furnace, both ends of the stock being heated to a proper curling temperature meanwhile. Leaving the furnace they pass downward, are lifted off and inserted in a double press which curls both ends at one operation. Each unit is capable of heating and curling eight spring leaves a minute or 3840 a day. These furnaces are rated at 170 kw. to 252 kw.

with a capacity to heat 2000 lb. of steel an hour to 2250 deg. Fahr. at a power consumption of not to exceed 400 kw. hr. a ton, heating billets 2½ in. in diameter by 8½ in. long. This furnace is approximately 12 ft. long and 7 ft. wide, built of sheet steel, lined with 2 in. of Silocel powder, 4½ in. of Silocel brick, 2½ in. of C-22 insulation brick and 4¼ in. of high-grade fire brick. The furnace roof, of arched type, is removable, equipped with a sand seal, lined with 5 in. of insulation and 4½ in. of refractory brick. The heating elements consist of two covered troughs of silica-carbide containing granular graphite. These troughs, supported on piers, extend lengthwise of the furnace, having suitable power input connections at the ends. Stock to be heated is charged into the furnace through seven openings 12 in. square in the back of the furnace. Heated stock is removed from the front of the furnace through similar openings. All the openings are fitted with hand-operated, counterweighted doors, sealed at the top. The floor of the heating chamber is flat, with the bottom of the discharge opening at 3 ft. 6 in. above the floor line.

Electrical equipment for this furnace includes 225 kw. oil-cooled transformers with primary windings for 440-volt, 60-cycle alternating current, arranged for connection to

ELECTRIC Forging Furnace Having as its Heating Element a Trough of Carbide Compound Filled with Pulverized Carbon and Energized Through a 78-In. Space Between the Two Large Electrodes. This furnace was furnished by the Electric Furnace Co., Salem, Ohio

The 28 electric furnaces in the forging department operate at a temperature of 2350 deg. Fahr. and require a total of 7732 kw. Seventeen of these furnaces use globar resistors, 1¼ in. in diameter x 28 in. There are twenty-seven heating elements to the furnace. Total power per furnace: 337 kw. at 220 volts, three-phase, 60 cycles; of which 187 kw. is on No. 1 control and 150 kw. on the second.

These furnaces are approximately 8 ft. wide, 4 ft. deep and 6 ft. 5½ in. high and are lined with suitable insulation and refractory brick to provide a heating chamber 5 ft. 6 in. wide, 22 in. deep and 22½ in. high to top of arched roof. The whole is inclosed in a steel-plate shell, well braced and reinforced to prevent warping.

Stock to be heated is inserted through a slot adjustable for opening 1 in. to 4½ in. The globar elements, rated at 10 kw. each on a 110 to 120-volt power supply, are star-connected for operation on the 220-volt, three-phase 60-cycle alternating current supplied. They are controlled by Leeds & Northrup recording controllers. These forging furnaces are lined with fire brick, red Silocel and natural Silocel. The resistors are held at each end by water-cooled spring contacts, thus arranged for quick replacement. The furnaces can heat 1000 lb. of steel an hour to 2250 deg. Fahr., with a power consumption giving about 4¾ lb. heated per kw. hr. on stock up to 2 in. in diameter.

A special 450-kw. trough resistor type furnace is designed to operate at a temperature of 2400 deg. Fahr. and

three-phase power supply, with secondary wound with six taps for variable power supply to furnace. The switching and metering equipment consists of one 1000-amp. magnetically operated oil-break switch, for primary circuit for furnace temperature control through Leeds & Northrup recording controller, one 2000-amp. six-point hand-operated selective type oil-break switch for secondary circuit for varying power input to furnace, one indicating type watt-meter, one current transformer and the panel. There is also a relay for magnetic switch operations from Leeds & Northrup controller.

While the greatest number of electrical furnaces are to be found in the spring and upset building of the Fordson plant, there are other installations in the motors and rolling mill buildings.

Three of the 19 furnaces in the motors building are quench furnaces, 24 ft. long, rated at 237½ kw. These are used for hardening the Model A crankshafts. Each furnace here has a capacity of eighty-five crankshafts an hour. They operate at a temperature of 1500 deg. Fahr. To save floor space, the drawing furnaces are built on top of the quench furnaces. The shafts are carried up and through these furnaces on a conveyor, the drawing furnaces using 189 kw. and operating at 700 deg. Fahr.

Other electric furnaces in the motors building include one 82-kw. continuous furnace for hardening push rods, with a capacity of 4800 an hour, one 149-kw. continuous furnace for hardening piston pins, also having a capacity

ELECTRIC Forging Furnace at the Ford Works. The height of opening for charging and withdrawing is adjustable to a maximum of 4½ in. The springs supporting the globar heating elements are back of the screen. A forging machine (behind the operator) is close alongside each furnace

of 4800 an hour; two rotary furnaces, 116 kw., approximately 14 ft. in diameter, which are used for hardening camshafts and which have a capacity of 204 each hour; three continuous quench furnaces, 207 kw., operating at 1500 deg. Fahr., and three drawing furnaces, 199 kw., for heat treating connecting rods and with a capacity of 11,000 rods in 8 hr. Practically all gears are drawn in three continuous furnaces, each 42 ft. long.

In the rolling mill building are two electric continuous furnaces for heating bar steel for forming ring gears. These use 400 kw. and 300 kw. respectively, both operating at 2000 deg. Fahr. Six other forging furnaces, totaling about 2700 kw., and each operating at about 2350 deg.

Fahr., and two continuous hardening furnaces of 300 kw. each, complete the present installation in the rolling mill building.

When electric power may be had at a low cost, such as 1c. a kwhr., the use of the electric furnace would seem to offer the solution of many of the troublesome problems arising in the forming and heat treatment of steel. In the main the advantages far outweigh the disadvantages. While the first cost of the installation, with its accompanying electrical control apparatus, is high, and the cost of energy per B. t. u. is high, these costs are more than balanced by other economies of operation and control. It is true that an electric furnace heats up slowly from atmos-

FORMING a Ring Gear for the Ford Model A. A piece of steel bar of right section and length is heated to forging temperature and then placed successively in two presses. The first one bends the two ends into a short circular segment, while the second one, shown here, completes the forming of the circle. The forming elements are brought forward by action of the toggles, being pivoted on the same center. The lower illustration shows the result after the forming members have been withdrawn

GENERAL Arrangement of a Globar Furnace, as Used in Forging Practice at the Fordson Works. Each globar element is supported at both ends by a fixture, water-cooled and held in place by springs. This is a Holcroft furnace, with several of its features developed by Ford engineers

spheric temperature at the start, but its close control afterward balances its account in this respect. Costs of repairs are apt to be high, too, but this condition may be ameliorated by avoiding delays and by making provision for quick replacement of resistors or other failing parts. Finally, there is likely to be some loss in case of intermittent operation.

On the other hand, in the operation of electric furnaces there is first of all a temperature regulation which is at once simple and sure. It is easily controlled automatically, and can be made to stay within very small variable limits. A recording controller makes hand operation or personal attention on the part of the workman or foreman unnecessary. The installation of an electric furnace is simple. It takes up little room. It is clean, both as to outside appearance and operation. The workman can stand near the opening in working position without discomfort. The outside heat is hardly noticeable, even in the hottest weather. Strange as it may seem, there is at times an actual necessity for closing the roof ventilators to prevent an excessive

draft in the spring department, on some days when the wind is in the right direction to cause an excessive draft. The temperature in this furnace room in August is not excessive.

Incidentally, all Ford furnaces are painted with aluminum. The effect both in clean appearance and radiation is at once apparent. In the case of the electric furnace labor cost is at a minimum and a high quality of product is possible, for several reasons. There are no troublesome gases to deal with, no products of combustion in the furnace or escaping into the outside atmosphere of the shops. The space around and above the furnaces may be kept clean; there is little to cause dirt or dust. Electric furnaces may be moved easily, shifted about as work or process lines require. There is little additional equipment needed and most of it can be put on one panel; it is moved with the furnace and set up just as easily.

The stock can be kept clean, there is little tendency to scale, no opportunity for steel to absorb harmful ingredients, such as sulphur, while being heated. The tempera-

HEAT Treatment of Springs in the West Half of the Spring and Upset Building Is Accomplished in a Battery of Electric Furnaces. To conserve space, the drawing furnaces, which operate at a lower temperature, are located on top, as shown. The parts pass from the lower furnace to the one above by means of a conveyor system

ture can be maintained at the desired level and there is no possibility of burning the stock. The furnace can be put into operation at the throwing of a switch, and shut down in the same easy way. The life of the heating chambers is long, because there is no combustion taking place in them and hence no deterioration from gases or fumes.

The fact that there is available at Fordson 500,000 hp.

made at low cost makes the use of electric furnaces for the purpose of heating steel for forging and hardening possible in a large degree. Yet it is beginning to be realized elsewhere that the advantages of electric heating are so many that even this element of power cost may not be so important as it seems. Certainly Henry Ford has shown his confidence in it, and the results seem to justify his judgment.

Automatic Control of Operations

Instruments Giving Both Records of Past Performance and Manipulation of Valves Under Pre-determined Conditions

USE of recording and controlling instruments in the iron and steel industry was reviewed by C. C. Eagle and Roy M. Walker, Bristol Co., Waterbury, Conn., at the Chicago meeting of the Association of Iron and Steel Electrical Engineers. They said that the increasing use of arc welding has created a demand for an instrument to record the cycle of operations and give a history of the work done by the welder. A recording shunt ammeter does this so well that it is regularly furnished with some welding machines. It gives a record of time worked by the welder, so that the faithful welder gets full credit for his work. The character of the curves shows the type of work. If a large stick or two sticks are used, instead of one, to rush the work, this is shown up by the excess current. Reversed polarity hastens the work and badly weakens the weld, and is unmistakably recorded on the chart. If an electrode is thrown on the ground and left there, the straight line curve shown on the chart indicates the grounding of the electrode. Reference to the chart is a help to the welder and enables the supervisor to correct irregularities.

Checking of operations on the reversing valves on open-hearth furnaces is considered of the greatest importance in most steel plants. It is essential that the reversing valve be thrown on schedule from one checker chamber to the other, so that each may be brought up to the proper temperature and fuel not wasted after the checker has absorbed this heat.

An effective way of checking this operation is to install an electric time recorder on the reversing valve. This time recorder has a pen operated by an electromagnet. This pen is wired to a contact on the reversing valve, so placed that, with the valve in one position, the circuit is open; with the valve in the other position, the circuit is closed. The pen moves over when the valve is in one position and moves back when the valve is reversed. The resulting record shows at a glance the exact time of each reversal.

In addition to this record for the superintendent, one plant uses a single-pen recorder at each valve to guide the operator and indicate to him how the furnace was running during the previous shift.

Automatic Control Eliminates Human Factor

Some tendency has been shown of late to do more than keep a record of the reversing valve operations. It has been felt that automatically controlling these operations, thus removing the human factor, would be a decided step forward and well worth some expenditure. This plan also takes into consideration the fact that the checker chamber at one end of the furnace frequently heats up more slowly than that at the opposite end.

A scheme of accomplishing this control has been worked out, using two pyrometer controllers. The location of the thermo-couple has been the greatest problem to consider here. Temperatures in the hot part of the checker work are so high as to require the use of platinum couples,

resulting not only in great initial expense, but also in great care and upkeep of thermo-couples. It has been pretty definitely established that a cooler spot in the rear of the checker work can be located where the changes of temperature are directly proportional to those in the hot zone. This permits the use of base metal couples and results in comparatively little upkeep.

Once this cool spot has been located, and the temperature there corresponding to the maximum temperature desired in the checker work determined, the rest is a simple procedure. A thermo-couple is located in each checker chamber and each couple connected to a pyrometer controller. The spotter on each controller is set at the temperature corresponding to the maximum temperature desired. The two controllers are then wired to the motor at the reversing valve. As soon as checker chamber *A* reaches the desired temperature a contact is closed in controller *a*, which starts the motor of the reversing valve, throwing it over to chamber *B*. Then, as soon as *B* reaches the desired temperature, a contact is closed in controller *b*, and the valve is thrown back to *A*. By means of an automatic reversing switch from the thermo-couples, one controller only will do this work.

Reversing Valves by Temperature Differential

A successful installation has been made to control the reversal of valves by differential temperature. By connecting the two thermo-couples in series, and opposed to each other, the control instrument is operated by the difference in the temperatures in the two checker chambers.

Some open-hearth departments have found it highly desirable to keep a daily check of temperatures in different parts of the checker work. This gives a valuable line on stoppages from dirt, soot, etc. For this work a portable indicating pyrometer is used. The usual range is 0 to 2500 deg. Fahr., using a base thermo-couple with a nichrome or some other high-temperature metallic protection well.

In a warehouse where sheets are stored, considerable expense is caused by the rusting of the sheets, including those in the center of a pile. This condition may be guarded against by reference to a recording psychrometer. This recorder is supplied with a small motor and fan to assure circulation of air over the wet bulb. The range of about 30 to 110 deg. Fahr. is satisfactory. If the record shows the atmospheric condition when dew will form, fans are started to circulate warm air throughout the warehouse, to prevent moisture collecting on the sheets.

To get the best possible efficiency from an instrument it must be selected with the right thermo-couple or bulb, the right length of lead, and the right range. Accuracy of the readings, under the severe operating conditions usually encountered in a steel mill, is the prime requisite. Then models are selected with protection cases suitable for the surroundings. Heavy cast iron cases, out of place on a fine switchboard, are ideal in a room filled with gas or acid fumes.

New Products from an Old Iron

TRANSFORMATION of a gray iron foundry, the principal product of which was brake shoes, into a manganese steel and gray iron production shop has been successfully undertaken by the American Manganese Steel Co., Chicago. This company purchased the Burnside, Ill., plant of the American Brake Shoe & Foundry Co., which consisted of seven and one-half acres of ground, improved with modern foundry buildings housing two cupolas, and a raw material storage yard served by a gantry crane. New equipment installed includes a 1½-ton per hour electric furnace, an annealing furnace, a core baking oven, new sand-handling and preparing equipment, and miscellaneous items, such as a 500-ton press used for straightening frogs.

The two cupolas (Whiting No. 7 and No. 8) were allowed to remain in their former location, which is on the west side of the main building and easily accessible to the storage yard and the material-handling and charging equipment. These units are available for use in supplying gray iron castings to the jobbing trade. The electric furnace is located in the northwest corner of this building, not far from the cupolas and close to the material yard, which extends parallel to the main building. Beneath the gantry crane is an industrial track, from which spurs extend at frequent intervals into the main building.

This plant produces work requiring large molds and flasks, and it was therefore decided that a large shake-

out hopper would serve two purposes: first, that of providing shake-out floor area for the large molds and, second, a storage or reservoir for the shake-out sand. This hopper is 16 x 20 ft. in area, and the top, which is covered with bar grating through which the sand drops, is set level with the floor.

Used sand is fed through the bottom of this shake-out bin to an apron conveyor, at the head of which is placed a short-center magnetic separator belt for removal of scrap, gagers, etc., before delivery to the bucket elevator. Scrap is removed through a trap door and is then loaded in boxes, which are carried away by an overhead crane.

From the magnetic separator the sand is elevated by a 7 x 12-in. bucket elevator to a tapered, hexagonal revolving screen, which acts as a breaker of lumps and also screens and removes refuse. This screen is housed in a steel box to which is attached a suction line and dust collector for the removal of dust and fines from the sand.

From the screen the sand is delivered to a belt conveyor, at the head end of which a two-way spout is arranged for diverting the sand to the facing-sand mill. If backing sand is being prepared, water is added in proper quantity by a spray pipe, which extends across

A FEEDER Apron (Below), 96 In. Wide, Delivers Sand to Large Flasks on a Holt Rollover Machine

SAND is Taken from the Shake-out Hopper by a 30-In. Apron Conveyor. This hopper, covered by a grating, acts also as a storage for used sand

Foundry

Modern Equipment Transforms Chicago Plant So That Electric Manganese Steel Castings Can Be Made—Sand Handling and Annealing Furnace Features

the bed of sand passing on the belt conveyor. The sand is then discharged to a double paddle mixer or pug mill, which mixes and reconditions it. Backing sand is handled by a short cross-belt conveyor and a long distributing belt conveyor operating alongside the columns in the main foundry bay. By means of adjustable plows, this sand may be discharged at any point to shoveling hoppers for floor molding purposes.

If old sand is required for preparation as facing, the water spray is shut off and the sand is diverted to a hopper which was erected over a No. 3 Simpson mill, located in a side room just off the main foundry. This hopper has two compartments, one fed with old sand by means of the belt conveyor described above, and the other receiving new sand from the storage by means of the crane and grab bucket. Facing sand is distributed from the mill throughout the foundry by boxes mounted on electric lift trucks.

At the end of the distributing belt conveyor, sand is discharged to a large overhead hopper, fitted on the bottom with an 8-ft. apron feeder that delivers sand to long flasks used for making guard rails. These flasks are filled in about 4 sec., and the feed is regulated by electric push

buttons, which control the motor operating the apron feeder. This sand-preparation and handling equipment was installed by the Link Belt Co., Chicago.

The 1½-ton electric furnace was designed by the Pittsburgh Electric Furnace Corporation, Pittsburgh. It has been located so that another unit, with a capacity of 3 tons per hour, can be installed at a later date. Power is supplied at 12,000 volts, three-phase, 60 cycles by the Commonwealth Edison Co., Chicago.

Electric Furnace Has Special Features

One of the features of the mechanical construction of this furnace is that ball and roller bearings are used throughout the electrode-operating gear mechanism, and the electrodes are counterbalanced so that the regulating circuit has only to overcome the inertia of the system. The electrode arms to which the clamps are fitted are fastened to one end of a flexible steel cable, which passes over ball-bearing sheaves and around a fiber sleeve on a winch drum and then up through ball-bearing sheaves to where a counterweight is fastened. This counterweight is equal in weight to the electrode arm plus the usual operating length of the electrode.

When the electrode is lowered to the point where it touches the scrap in the furnace, the tension on the wraps

GASES Enter the Working Chamber of the Annealing Furnace (Above) Through Ports So Proportioned As to Give Proper Heat Distribution

THE Annealing Furnace (Below) Is Designed with Double-Pass Combustion Chambers and Has a Capacity of 12 Tons per Hour. It is charged by means of a car

of cable around the fiber sleeve of the winch drum is loosened and the sleeve expands, allowing the winch motors to turn without unwinding the cable further. The same operation occurs when the electrodes are raised too high. The counterweight then comes up against its stop and releases the "friction bite" on the fiber sleeves of the winch drums, and again the winch is free to turn without further overhauling of the cable. This system of counter-weighted friction-bite hoist mechanism avoids the use of limit switches at the top and bottom of the travel of the electrode arms.

The core drying oven is 40 ft. wide by 80 ft. long. It is fired by means of coke heaters, and the temperatures range from 700 to 800 deg. Fahr. It is of the lift-door type and is loaded by means of cars, which are moved in and out of the oven by a crane. Made by the Swartwout

Prepared Sand Hoppers Are Filled from a Distributing Belt Conveyor

Co., Cleveland, the oven is constructed with walls containing 4 in. of insulating material, which is protected on both sides by 14-gage, rust-proofed steel sheets.

Annealing Furnace Has Reducing Atmosphere

The annealing furnace has a capacity of 12 tons of castings per charge. The annealing period is 6 hr., which is followed by a heat soaking time of 2 to 3 hr. The unit was designed by the Carborundum Co., Niagara Falls, N. Y., to anneal manganese steel castings in a reducing atmosphere at a temperature of about 1950 deg. Fahr. The loading car is 8 ft. wide by 18 ft. long.

A feature is the use of Carboradiant combustion chambers, by means of which uniform temperature and control of furnace temperature and atmosphere are said to be obtained. The combustion chambers, which are of the double-pass type, are arranged in pairs on both sides of the annealing furnace. One burner for each chamber fires into the lower pass, in which vaporization of the oil and mixing with air are accomplished. The gases are then led to the upper pass, from which they travel into the working chamber through ports provided by spacing the top tiles of the upper pass. These ports are dimensioned to

so proportion the amount of gases discharged along the length of the chamber to give proper heat distribution.

These chambers are designed to have a uniform temperature throughout their length, and they deliver heat by radiation to the lower portion of the charge on the car, thus offsetting the drop in temperature of the gases as they pass down through the castings to the off-take ports located along the sides at the level of the car top.

Proper atmosphere is maintained within the furnace because the oil is vaporized and mixed with the air supplied for combustion before entering the working chamber. Burner adjustment is regulated by observing, through peep holes in the furnace shell above each combustion chamber, the color of the gases leaving the ports in the top of the combustion chambers.

Between the combustion chambers and the charge is interposed a firebrick screen wall, designed to regulate the radiant heat delivery from the combustion chambers to the load. The lower section of the wall is checkered to permit a greater quantity of radiant heat to reach the lower zone of the charge, where the combustion gases are at their lowest temperature. Excessive temperatures and destructive flame action are confined within the combustion chambers, conditions which the chambers are said to be capable of resisting because of the high refractoriness of the silicon carbide tile from which they are constructed.

The output of the foundry is varied. Several standard lines are made, such as manganese steel track supplies, centrifugal pumps to handle gravel and coarse material, and steam shovel dippers. The gray iron capacity is devoted almost wholly to jobbing orders, most of which come from railroads.

High-Pressure Steam Boilers

Conclusions as to the best type of high-pressure steam boiler under present limitations were recently submitted to the American Society of Mechanical Engineers by George A. Orrok, consulting engineer, New York Edison Co., New York. For three pressure ranges the conclusions are:

1—Very high-pressure boilers (2000 lb. and over). Flash type, tubes 2 in. or less in diameter, no header, no drums, all welded joints, except at collectors and manifolds where flanged or coned joints should be used. These boilers may consist of a single coil for small outputs or multiple coils as in the Benson boiler.

2—High-pressure boilers (800-1600 lb.). Water-level type, consisting of a bank of tubes of larger diameter than those indicated for the flash type, with walls not to exceed one-tenth of the outside diameter in thickness. Tubes to be expanded in headers or small-diameter drums whose thickness when exposed to fire should not exceed one-tenth of the outer diameter. Water-line drum should not contain when half full more than 10 per cent of the water content of the boiler. The boiler should be high rather than low, so that the water in the tubes may be under sufficient static head to insure steadiness of steam, and restrictions in discharge opening to steam drums should be sufficient to obviate serious moisture in the steam. Dry pipes or separators should precede the superheater. Steaming economizers should not be used, but the feedwater should be heated by economizer or the regenerative system so that little water heating is left to be done by the boiler itself. Water-cooled furnace walls should be used in sufficient amount to make the furnace repairs a negligible quantity.

3—With temperatures in excess of 750 deg. Fahr. we must be content with a shorter life of tubes and be prepared to replace coils or tubes from time to time. The only alternative is the use of much-higher-cost alloy steel.

Mr. Orrok discussed in his paper such matters as the effect of tube inclination, the releasing surface and steam space, boiler materials and safety in operation.

The Rising Tide of Iron and Steel

Curve of Production from 1919 to 1927 Closely Parallels the
Record-Breaking Pre-War Trend

BY E. E. THUM

THE article by Edwin C. Eckel in the June 14 issue of THE IRON AGE, entitled "Iron Industry Facing Great Changes," contains many observations which should be thoughtfully considered by all men in the metal industries who are planning ahead for future growth. I find myself unable to agree with one of his conclusions, namely, that "we are not likely to resume our normal or pre-war rate of increase for a good many years to come." The very graph he uses to show the world pig iron output indicates that production is now, and has been since 1919, increasing at a rate closely parallel to the pre-war trends, save only for a 12 or 13-year setback due to that upheaval.

Of course, one cannot certainly predict the future from the past, except in elementary physical science; nevertheless, good information on past performances, interpreted in the light of current events, is the best basis for predictions about industrial developments. As a case in point, a person in 1895 would have been justified in plotting future production of pig iron in a slowly rising curve, extrapolated from the known trend up to that time. Subsequent history would have proved the conservatism of this prophecy.

Even in 1905, after the actual production had taken a definitely higher rate, Sir Robert Hadfield in his presidential address before the Faraday Society prophesied that the world's production would continue to increase at the same rate it had during the preceding 30 years; that is, slightly over a million gross tons yearly. The graph shows how much he underestimated the ability of the people to absorb iron; for it took the profound dislocation of a great war to bring his trend line within calling distance of actual production.

In making his calculations Sir Robert assumed that the 40 million tons of iron made in 1900 was consumed by only 200 million people; and if two-thirds of the total population of the earth would eventually use the metal at the same rate the annual consumption would be above 250 million tons. This gives what he thought was the eventuality—an annual consumption of 400 lb. per capita. But in the

United States last year 120 million people consumed 35 million tons of pig iron, a per capita consumption of 650 lb. in round numbers.

On this basis it appears that the mechanical age has called for more and more iron; so the acceleration of production between 1904 and 1916 may be taken as a definite trend and not as a temporary burst of speed. But, of course, there must be a maximum some time. The production curve will sooner or later show a point of inflection. From then on the curve will reverse itself, gradually approaching the time when new production merely replaces natural wastage and decay. If such a point of inflection in the curve marked "pre-war trend" be placed at the year 1912 or 1913, and the line exactly reversed in curvature, I believe the predictions would not have been unduly optimistic and would have represented what would have happened in normal growth. Dr. John A. Mathews of the Crucible Steel Co. of America has also expressed the opinion that the rate of future increase will be curtailed through the economies resulting from alloy steels and corrosion-resisting alloys.

If this curve representing pre-war trend is moved over parallel to itself 12 years, it will be found to fit closely the recorded pro-

duction since 1919. And why shouldn't it? The urge to use labor-saving devices, to travel with speed and comfort, to beautify our buildings, bridges and highways, is here just as strong now as before the war. The war absorbed so much wealth and man power that the entire civilized world staggered along in a dazed condition, having lost sight of the old economic landmarks. It is surprising such substantial recovery as is shown by the actual production figures could be made in as little as 12 years. But the figures show it has been done!

This post-war trend line crosses the year 1936 at a production of 105 million tons. Dividing this figure by the factor 0.87 (the ratio between world production of pig iron and that of steel, a constant ratio since 1915) the figure of 120 million tons is computed to be the expected produc-

tion of steel in that year. This checks fairly closely the figure 115 million tons, estimated as the probable 1936 production of steel, in THE IRON AGE editorial printed June 23, 1927.

I therefore agree with Mr. Eckel that the maximum

rate of annual increase in iron and steel production may have been reached or passed. But I believe that nothing less than another devastating war will prevent the steady expansion in output called for by the post-war trend line sketched in the figure.

Production and Use of Die Castings

European and American Practice Contrasted—Availability Depends on
Machining Labor Eliminated—Heavy Price of Dies
Must Be Absorbed by Savings

BY SAMUEL TOUR*

GENERALLY speaking, the pressure die casting process requires (1) a machine capable of delivering molten metal under pressure to a die; (2) a metallic mold or die to receive the molten metal; (3) a suitable alloy which will function in the machine and form in the die, and which will yield a casting with the desired physical properties.

Die castings, properly speaking, do not include castings poured by gravity into a metallic mold or die, but presuppose the use of definite pressure. Proper combination of the three essentials noted gives a casting of sharp detail, finished or practically finished, requiring little or no machining, checking to close dimensional tolerance and rapidly producible in large quantities. The process often makes possible the use of much thinner walls than can be cast by any other method.

It is incorrect to say that castings cannot be considered as practical die-casting jobs in lots of less than 10,000 pieces. As a general rule, the pressure die-casting process is most economical where the elimination of machining and finishing operations is possible. The number of castings necessary to absorb completely the initial cost of the die depends, therefore, upon the amount of costly machining and finishing operations eliminated by the use of pressure die castings. Often this saving is so great that 1000 castings or even a few hundred will justify the construction of a die.

Present estimated annual production of pressure die castings in the United States is from 10,000,000 to 12,000,000 lb. of aluminum-base castings and from 50,000,000 to 60,000,000 lb. of zinc-base die castings. It is evident, therefore, that these types of castings are being widely used.

Pressure die castings are used in automobile parts such as steering wheel spiders, carburetor parts, oil purifier parts, oil pumps, fans, water pumps, electric starters, spark and throttle control parts, windshield wipers, instrument boards, speedometers, hand rests, interior trim handles, cowl, etc. They are used extensively in vacuum cleaners, washing machines, typewriters, check writers, adding machines, calculating machines, small motors, magnetos, radio condensers, radio frames, loud speakers, telephones, vending machines, instrument parts, instrument cases, small machine parts, ornamental parts, furniture, cooking utensils and electric refrigerators.

Producers generally purchase their raw materials in zinc, aluminum, lead and tin-base and mix their own alloys. Customers usually designate which type of alloy is desired and supply information as to service requirements of the

finished castings. They then depend upon the producer to select, in the type specified, the particular composition which his experience tells him will result in the best castings for the purpose. Obviously, no one alloy will meet the service requirements of all such castings.

European Die-Casting Practice

In another appendix to the committee report, E. V. Pannell, consulting engineer, British Aluminum Co., Ltd., New York, discussed the construction of die castings in Europe, of the type commonly called by that name in the United States. In Great Britain it is estimated that the heavy metal die-casting production is from 3,000,000 to 5,000,000 lb. a year.

In some cases, he said, the machines used are quite primitive, being entirely manual in operation. A number of them, mostly of the plunger type, are of Swedish design. Another Swedish design, semi-manual, uses air also, at from 16 to 40 lb. pressure. With small castings this machine is driven from a counter-shaft and produces up to 30 castings an hour of not more than $\frac{1}{4}$ lb. each. With manual operation, much heavier castings can be made.

An English machine designed with plunger and rack and pinion feed has a die-preheating chamber. It will operate with metals up to a melting point of 930 deg. Fahr. The metal pot holds 55 lb. of zinc-base alloy.

The production of light alloy die castings in England does not possess the potentialities of the American situation. Castings from a given pattern are called for in relatively small numbers. As the orders average perhaps not over one-tenth the number called for in the United States on a single order, the die charges for castings are ten times as great.

In the automotive field, particularly, this limiting condition is found. In the United States 4,500,000 automobiles are produced by about 45 leading makers and average 100,000 each. In Great Britain 100 makers produce 150,000 cars, or an average of 1500 cars of a given design. Standardization, therefore, is carried to a much smaller degree than in America and the great diversity of parts called for is best served by the use of permanent-mold castings.

For reasons growing out of this situation, and similar situations in other industries, the entire annual production of light alloy die castings in Great Britain probably does not exceed 1,500,000 lb. A similar amount is produced in Germany and an appreciably smaller quantity in France.

In Europe there is a certain amount of prejudice against the use of the air-operated machine. This no doubt is on account of the relatively high cost of compressed air for a small shop. It is asserted also that air leakage and the behavior of compressed air on the molten aluminum are a disadvantage. Lack of density in the castings is mentioned.

*Metallurgist Doehler Die Casting Co., Batavia, N. Y. This is an abstract of an appendix to a committee report at Atlantic City in the last week of June, at the meeting of the American Society for Testing Materials.

Better Planning of Production Is Crux of Distribution Problem

Output in Keeping with Market Analysis Would Prevent Domestic Dumping, Says Economist—Research in Distribution Urged

THE problem of distribution affects our whole national economy; it is much broader in scope than the marketing program of the individual manufacturer, declared Magnus W. Alexander, president National Industrial Conference Board, New York, in addressing the distribution conference held in New York, June 28 and 29, under the auspices of the bolt, nut and rivet industry.

"Distribution," he said, "involves much more than transportation, marketing and handling. To many distribution means simply the disposal of their own output, that is, the problem of marketing their own goods. Market analysis and salesmanship, it is believed, can solve the problem. We must examine the issue, however, not from the standpoint of the individual producer alone, but from the broad viewpoint of national economy.

"It is seldom recognized that the distribution problem goes much deeper and, in fact, has its roots in production. Faultily planned production cannot be rectified—although in part it may be corrected—by even the most excellently planned marketing program, a fact evidenced in the failure of many carefully designed and strongly financed advertising and sales campaigns."

Growing Proportion of Employed Engaged in Distribution

One heritage of war days, Mr. Alexander pointed out, is our over-expanded plant capacity, a condition aggravated by a greatly accelerated pace of production resulting from continuously increasing industrial efficiency.

"The fact remains, however, and much evidence has been adduced to prove the point, that productive efficiency in certain lines, particularly in the last few years, has set a pace which might easily outstrip domestic consumption under present conditions. There has arisen, therefore, a great deal of discussion of the 'distribution problem.'

"Statistical data on the process of distribution are as yet remarkably scant," said Mr. Alexander. "It is claimed, on the basis of individual observations and on inquiries into specific lines of commodities, as agricultural products, for instance, rather than on comprehensive, scientific data, that the cost of distribution generally has been steadily and disproportionately increasing and that economic gains, achieved by efficiency in production, in part are lost by waste in distribution.

"We know that in many instances the consumer price is several times that of production cost, and census data for the past 50 years give substantial evidence that the economic cost of distribution has been constantly rising as compared with the cost of production. In 1870, 8,629,000, or 88 per cent of all those gainfully occupied in production and distribution combined, were engaged in production proper, that is in manufacturing, mining and agriculture, as against 24,470,000, or less than 70 per cent of all those thus gainfully occupied in 1927."

Domestic Dumping One Cause of Higher Distribution Costs

The essential waste in distribution, according to Mr. Alexander, occurs in the competitive over-production of

certain commodities that happen to be convenient for the manufacturer to produce, resulting in expensive high-pressure sales campaigns and frequently in ruinously low prices. This kind of marketing has been characterized as domestic dumping.

"Every well informed business man knows," declared

the speaker, "that goods are being sold continuously at or even below the cost of production. This naturally raises a far-reaching question: Is it economically sound and socially desirable that goods be sold without profit, or at a loss, over a considerable period of time? Is that sound or constructive competition?

"A producer may be able to dispose of a certain amount of his output at no profit or even at a loss and continue to exist by virtue of the profit made on the bulk of his output. But is it not inevitable, because of the interdependence of one business transaction on another, and the interdependence of all industries, that such a policy is bound to disorganize trade and in the end is bound to react disastrously upon him who sells at or below the cost of production?

"It is this very circumstance of selling a portion of quantity production at or below the cost of production that has sharpened competition between producers in many instances to the point of being ruinous, and probably has tended greatly to increase distribution costs where high-pressure selling has been applied."

The speaker urged more thorough market analysis and closer study of consumer demand to avoid needlessly sharp competition with resulting dwindling profit margins.

Large-Scale Enterprises Sharpen Competition

"One of the most interesting and significant features of our business evolution during the past decade," asserted Mr. Alexander, "is that large-scale enterprise, which a quarter of a century ago was feared as a danger to free competition, today is a prime factor in accentuating competition.

"Business conditions in the United States during the past decade have presented a paradoxical situation: Great national prosperity with record business activity, but at the same time a competitive struggle which has resulted in precarious profit margins.

"We see, furthermore, that the very method of production that has contributed so much to our national income, namely, efficient mass production, which has effected high productivity per worker and has made it possible to combine high wage levels with low prices, is the very factor that today is accentuating the competitive struggle and thereby emphasizing also certain distribution problems to which trade associations might well devote their earnest attention."

Although, broadly speaking, there can be no over-production, there certainly can be a surplus output of a given variety of commodity at a given time. "It is therefore in planning what to produce that the fundamental solution of the distribution problem lies," declared Mr. Alexander.

Jobbers and retailers, he indicated, are not necessarily to blame for mounting costs of distribution, as they are called upon by customers for increasingly elaborate service. The average ratio of profits to receipts is considerably smaller in trade than in manufacturing and other lines of business activity.

Some Increases in Distribution Costs Justified

"It is necessary in discussing the increasing costs of distribution to distinguish between what constitutes actual and avoidable waste, such as unnecessary cross-hauling, congestion of perishable commodities, unnecessary handling, misdirected high-pressure sales methods, and such other elements which increase distribution costs but add nothing to the products; and those elements in distribution that increase either the convenience or the desirability of the commodity and are demanded by the producer, as, for instance, packaging, quick delivery in small quantities and other various services performed by the dealer for his customers," said Mr. Alexander.

"These latter services in essence become a refinement of the products and are to be classed as manifestations of

our rising standards of living rather than as costs representing economic waste."

Need for Scientific Research in Distribution

Prosperity in the United States in the past decade has been due, in large measure, to industrial productivity and the elimination of economic waste in production through mechanization, he asserted. Rationalization of the distributive process, combined with careful production planning, should result in a further substantial economic gain.

"The pressure of our present competitive struggle is a challenge to renewed effort to do our utmost in stimulating scientific research and to apply its results to production and distribution alike. Constant vigilance, comprehensive and accurate information and scientific analysis of all facts and economic trends having any bearing on our business activity are the keys to the maintenance of our economic well-being," asserted Mr. Alexander.

"Ours may rightly be called a machine civilization," said Mr. Alexander in conclusion, "but it should always be remembered that we owe to the machine both the leisure and the price for our cultural and social progress."

Individual Roller Table Drives

Improvement in Control, Compared With the Inflexibility of Group Drives —Breakdown of One Roller Does Not Cripple Train

GROUP roller drives, as for roller tables, whether of the cable and sheave type, or bevel gear type, lack flexibility in that the individual rollers cannot be controlled, said J. C. Dobelbower, Crocker-Wheeler Electric Mfg. Co., Ampere, N. J., speaking at the Chicago meeting of the Association of Iron and Steel Electrical Engineers. "In case of motor trouble, breakage of cable or gears, the entire table is out of commission. With the roll-out motor drive the failure of a driving motor affects only the one roller—in fact, a number of motors in the train could fail without a shutdown of the table. This also permits shutting down some of the motors, to produce a drag on the speed of the strip or bar, if desired. There are also fewer bearings to lubricate than on the group drive, which means less maintenance and fewer chances of trouble.

"With any of the types of motor for roller drive it is essential that the insulation throughout be such that it will stand up under the heat obtaining and all parts must be of extra rugged construction. In installing roll-out motors it is essential also that each motor be protected by an overload relay or fuse, to prevent roasting out in case the motor is stalled, due to jamming or any other abnormal condition, unless the motor is designed to permit stalling.

Control of Speeds Desirable

"Power for driving roll-out motors is best obtained by use of a motor-generator set. This should consist of a variable-speed d.c. motor driving an alternator. By the use of this combination the speed of the alternator can be varied, thus changing the frequency and voltage of current delivered to the roll-out motor. This permits the operator to control the speed of the strip or bar on the table.

"Roll-out motors of the general purpose design can, if desired, be ventilated. If this is done, however, it is necessary that clean air be supplied; the ventilation can be obtained by bringing the air in at one end of the motor at the bottom, and discharging it at the bottom of the opposite end. This type of motor, however, should not

require ventilation, as it is comparable to any fully inclosed motor operating in a hot place. The roll-out motor of the design where the motor is built directly in the roller is, however, a different problem. The motor, in this case, is subjected directly to the heat from the strip or rod being carried on the outer surface of the motor. Thus heat is applied to the surface which, in the ordinary design of motors, is the surface from which heat is radiated."

American Standards Association to Succeed Standards Committee

Reconstruction of the American Engineering Standards Committee to keep pace with the growth of the industrial standardization movement in the United States is now under way, it is announced by the committee. The principal features of the reconstruction are the definite federation of national organizations, under the name American Standards Association, in such a way that trade associations interested in standardization may more readily join in the direction of the movement; placing the technical work of approving standards in a standards council; and concentrating administrative and financial responsibility in a board of directors composed of 12 industrial executives.

The underlying principles remain unchanged. The basic functions remain completely in the hands of the representatives of the member-bodies. The individual members, whether of the board of directors or of the standards council, are appointed or nominated by the member-bodies, which thus remain the fundamental units in the organization.

The name American Standards Association is being adopted as more accurately descriptive of the reorganized association, and also because of the misunderstandings and misconceptions which have frequently occurred in connection with the words "engineering" and "committee." The scope of the work is, however, being limited to those fields in which engineering methods apply.

Cast Steel Core for Bronze Gulls

*To Support a Feature of a Monument on the Potomac to America's
30,000 Lost at Sea*

TO the more than 30,000 Americans who have perished at sea since the nation was founded—heroes of naval battles and martyrs to commerce, rescue work or adventure, a striking monument is to be built on the banks of the Potomac River in Washington, on a site in East Potomac Park granted by Congress, not far from the National Cemetery in Arlington. The memorial is to cost \$500,000. About a third of this sum has been contributed, many gifts coming from school children. A national campaign to raise the remaining \$350,000 is being directed by William Fellowes Morgan, Jr., 107 Cliff Street, New York.

A reproduction below of a photograph of the model of this Navy and Marine Memorial shows the free-flying gulls, which make the monument an unusually interesting piece of sculpture. To support the considerable weight of the gulls the steel armature shown at the right was constructed at the Tietjen & Lang branch of the Todd Shipyards Corporation at Hoboken, N. J. Begni del Piatta, the sculptor who introduced the use of the steel, is shown seated in the center of the group.

Heat Savings from Insulating Furnaces

One Year's Operation May Pay Installation Cost—Quantitative Results Outlined and Thicknesses Recommended

INSULATION applied to open-hearth furnace regenerators has not only minimized radiation losses, but also has cut air leakage losses, said L. B. McMillan, consulting engineer, Johns-Manville Corporation, New York, in a paper before the Chicago meeting of the Association of Iron and Steel Electrical Engineers.

Among the advantageous results attained through the use of insulation on checker chambers are: (1) Direct saving in fuel consumed per ton of steel produced; (2) increased temperature of the preheated air and gas; (3) improved conditions of furnace atmosphere, due to reduced air leakage; (4) increased speed of heats; (5) increased production; (6) decreased losses during Sunday shut-downs; (7) increased temperatures in gases delivered to waste-heat boilers, resulting in increased steam production.

All of these results have been secured in varying degrees in many installations. In some cases the saving in fuel has been the outstanding advantage. In others increased speed of heats and increased production have been most noticeable. In still others the most notable feature was increased steam production in the waste-heat boilers. Naturally, with varying conditions of operation the various items will not show up in the same proportion in each installation. But in every installation investigated it was found unmistakably apparent that highly desirable results were being obtained, and this without detrimental effect on the brickwork, where insulation was properly proportioned to the conditions encountered.

Air Infiltration Is Bothersome

There are cases where the spaces around the checker chambers are well ventilated and relatively cool, with correspondingly lower wall surface temperatures, yet where the losses are undoubtedly greater than in others where the chambers are in confined spaces, where much higher temperatures prevail. In still other cases, the rate of air infiltration through the walls is such that the temperature of the wall may be deceptively low. In such cases losses by radiation may not be excessive, but air infiltration losses in such cases are none the less real and preventable.

The best means of estimating the savings in heat transmission losses is through the use of calculations based on the thicknesses and conductivities of the materials, and the temperature conditions involved. Such computations show that, in reduced transmission losses alone, the insulation of checker chambers is fully justified; and the saving through reduction of infiltration losses is just so much more net gain.

Calculating the Benefits in Dollars

What these savings in B.t.u. an hour really mean is best visualized by expressing them in terms of savings in dollars per 100 sq. ft. a year. In the case of a 13½-in. roof at an average inside temperature of 2400 deg. Fahr., the saving in B.t.u. an hour by 2-in. insulation is 443 B.t.u. If the furnace is operated 6000 hr. a year, the equivalent saving in dollars per sq. ft. is 53c.; or \$53 per 100 sq. ft. a year, even at a value of heat of only 20c. per 1,000,000 B.t.u. This annual saving is considerably more than the cost of the insulation, so that the initial cost is repaid in a few months' operation, after which the saving is clear gain. In fact, from the heat-saving viewpoint, the use of

much thicker insulation would be justified. But other practical considerations make it advisable to limit the thickness of efficient insulation on the roofs to about 2 in., which successful installations have shown to be entirely safe.

On side walls, however, thicker insulation may be used and the heat loss reduced to a more economical basis, without fear of danger to refractories, because the brick work is thicker, and the average temperatures are lower. It is true that the temperatures to which the upper portions of the side walls are exposed are the same as those under the roof, but the omission of insulation at the skew back, and the downward flow of heat through the thick wall to the cooler lower portions, prevent the raising of the mean temperature of the wall to a dangerous point, even in the case of the portion above the checkers.

Saving by 4-in. insulation on an 18-in. firebrick wall at an average inside temperature of 2000 deg. Fahr. is 365 B.t.u. per sq. ft. an hour. This is equivalent to a saving of \$44 per 100 sq. ft. a year on the basis of 6000 hr. operation and a value of heat of 20c. per 1,000,000 B.t.u. This saving is sufficient to pay an annual return of about 70 per cent on the investment represented by the cost of insulation. A thickness of insulation of 3 in. to 4 in. is clearly justified on these portions of the side walls.

Percentage Factors Do Not Tell the Story

Referring to the question of savings in terms of total fuel cost, a word of warning was issued in connection with such percentages. Percentages are useful if properly interpreted; when misinterpreted, they are likely to be highly misleading. A saving of 3, 5, or even 10 per cent might look small in comparison with total costs, or with savings which might be effected in other directions, as by more careful operation, etc. The true perspective is obtained by comparing the annual saving with the annual cost of effecting that saving, regardless of what percentage relationship these bear to the total operating cost. In the case of insulation, the saving may appear to be small when expressed as a percentage of the total fuel bill, but likewise the annual cost of maintaining the insulation is a still smaller percentage of that small total fuel bill, therefore the saving looms large when compared with the cost of effecting it.

Example of a Well-Designed Insulation

In a typical installation of new checker chambers the walls above ground, and to a point about 1 ft. below grade, are insulated to a total thickness of 3¾ in. with block insulation applied in two layers, so that the second layer overlaps all of the joints in the first layer. Temperature measurements on checker chamber walls insulated in this manner have shown an average of approximately 1200 deg. Fahr. between the insulation and the firebrick. This increased temperature at the outer surface of the brick demonstrates the effectiveness of the insulation in limiting heat flow through the wall, and yet is not so high as to result in a dangerously high mean temperature in the brickwork.

The roofs are insulated to a total thickness of 1¾ in., with 1¼-in. block insulation and ½-in. cement. The use of as thick insulation on the roofs as on the side walls

should be recommended, but observed temperatures averaging approximately 1100 deg. Fahr., between the 1¾-in. construction described above and the brickwork, indicate that the thickness of insulation could be increased to 2 in. without endangering the brickwork. The fact that the temperatures under the roof are not maintained continuously at the maximum point, and that the peaks are of very short duration, insures that the mean temperature of the brickwork is well within the range of safety.

Earth Is Not a Natural Insulator

The walls below grade and the floors of the chambers are insulated with 2-in. block. It was formerly the general belief that, because of the resistance to heat flow offered by dry earth, insulation was not required on the underground portions. However, a more thorough analysis of the situation shows that the use of some insulation on these portions is highly advisable, but probably the thickness used should not exceed 2 in. The earth may not in most cases be dry at any great depth below the chambers, and the evaporation of moisture which penetrates into the dry zone around the furnaces represents a considerable expenditure of heat.

Furthermore, the theory as to the relative insulating effect offered by the dry earth is based on the so-called "steady state" of temperatures. But this steady state is not even approximately attained for many months after

the furnace starts up. All the while during this period heat is being dissipated, to increase the temperature of the surrounding earth, and before this rate of dissipation becomes negligibly small the furnace is shut down to be reconditioned for another campaign. Still another justification for insulation on these portions is, of course, the protection which it affords to the foundations and steel buckstays.

Insulation of existing checker chambers is just as important as in the case of new ones. In some cases it may be even more important, because of the effect of insulation in minimizing air infiltration losses. The block insulation itself provides a considerable increased resistance to air leakage and, furthermore, the outer surface of the insulation may be maintained more effectively airtight than the bare brickwall. The walls above grade and the crowns may be insulated as described above for new furnaces, except that, in cases where rebuilding is anticipated within a few years, the thickness of insulation may be reduced somewhat, as, for example, to 3-in. thickness on the walls and 1½-in. thickness of blocks on the roofs. Insulation of the underground portions of old checker chambers should, of course, be deferred until the time of rebuilding. But, since the savings by insulation of the above-ground portions repay the cost quickly, even a few years' use would make that part of the work a profitable investment.

Producing Wide, Thin Strip and Skelp

Arrangement of Mills and Their Motor Drives to Roll With Minimum Chilling and Low Power Drafts

TOLERANCES to which skelp must be rolled are usually not extremely close, and the gage for a given width is usually heavier than for other strip. These general conditions were outlined by A. F. Kenyon, Westinghouse Electric & Mfg. Co., East Pittsburgh, in a paper entitled "Selection of Main Drive Motors for Strip and

Fig. 1—Continuous Skelp Mill, 13-In., With Rope Drive. The stands are so spaced that the steel is never simultaneously in two groups of roughing stands or two stands of the finishing train

Skelp Mills," read at Chicago last month before the Association of Iron and Steel Electrical Engineers. "Most skelp mills," he pointed out, "do not require the refinements of arrangement which are so necessary to the successful operation of a strip mill.

"For light and medium tonnage production of the smaller sizes, a simple mill train, or a looping finishing train with a separately driven roughing stand, serves well. Wide skelp is produced in much the same manner and on the same types of mills as plate. The 13-in. continuous skelp mill shown by Fig. 1 is laid out to roll skelp in sizes ranging from 13/16 in. wide x 0.067 in. to 0.115 in. thick, up to 7¼ in. wide x 0.160 in. to 0.225 in.

thick, at a delivery speed from the last stand of about 1150 ft. a minute.

"Ten roughing stands are arranged in four groups, the groups being so spaced that the same piece is never in more than one group of stands at any one time, although it may be simultaneously in the two or three stands of each group. The finishing stands, also, are spaced so that the pieces run out before entering the succeeding stands. The mill is driven by two duplicate 2500-hp., 184 r.p.m. induction motors through rope drives.

"With the more recent installations, gear drives rather than rope are generally used, and there is also the tendency

Fig. 2—Gear Drive with Multiple Motors, Applied to a 14-In. Continuous Skelp Mill, with Spacing Similar to That in Fig. 1. The motors include

	A	B	C	D	E
Hp.	1,500	1,000	2,000	1,000	1,250
R.p.m.	491	293	294	209	294

to apply a greater number of motors, to lessen the complications of the gearing. Fig. 2 is an example of a 14-in. continuous mill, designed to do practically the same work as the mill just described, and with a similar arrangement of the roll stands. With the greater number of driving motors, the diversity of load from the several stands is not so great, and installation of a greater total horsepower of motors is necessary than if the mill were driven by one or two large motors. It is noted that the total horse-

power of motors on the mill shown in Fig. 2 is 6750, as compared with 5000 on the mill shown in Fig. 1.

Compactness Has Several Advantages

"In other forms of skelp mills, the stands are all closely spaced in a continuous line, so that a single billet may be in all stands simultaneously. Such mills are very compact in their arrangement, require little labor to operate, and finish rolling at a fairly high temperature,

Fig. 3—Close Spacing of Stands in a 10-In. Continuous Skelp Mill Driven by Gearing and Belt from Three Motors. Compactness and low labor and power costs are features

so that the energy consumption for a given rolling schedule is usually less than for a mill where the steel runs out between passes. The 10-in. mill shown in Fig. 3 is so laid out. The seven roughing stands are driven by a 2000-hp., 234 to 360 r.p.m. rotary-converter type adjustable-speed set. The edger is separately driven by a small d.c. motor, and the three finishing stands are driven through belt by a second 2000-hp. adjustable-speed set. The maximum delivery speed is approximately 1100 ft. a minute.

"Two of the most recently installed skelp mills are driven entirely by direct current adjustable-speed motors. Adjustable-speed drives are almost a necessity for a mill rolling any great range of product sizes, and where the

motors are of small or medium size, and closely grouped together, direct current often works out to advantage. On two other large sheet bar and skelp mills the greatest economy in first cost and efficiency in operation were realized by a combination of alternating current drives on the roughing and intermediate sections and direct current drives on the finishing stands, where the maximum flexibility and ease of control are desired.

"Active demand for long lengths of 16-gage and lighter material up to widths of 16-in. or more, by the automotive, metal furniture and other industries, has caused the installation in recent years of a large number of mills especially designed to produce this wide, thin-gage strip. The thin strip cools very rapidly. Thus, to expedite rolling and permit the finishing of the process at a sufficiently high temperature, the stands are closely spaced in tandem, and the material is rolled at comparatively high speeds.

Anti-Friction Bearings Change Conditions

"The latest development in rolling thin, flat products is the use of four-high mills with the backing rolls supported by roller bearings. Such mills make it possible to roll the thin gages up to widths of 48 in. or more, and in lengths of several hundred feet.

"Roll neck friction in such mills is much lower than in mills with plain bearings, and a marked reduction in power requirements and energy consumption is to be expected. For instance, several conventional strip mills rolling 16-in. to 20-in. wide 16-gage strip, at delivery speeds of about 1200 ft. a minute, have 1800-hp. motors on the finishing stands, and these motors are at times operated above their ratings. Modern mills with roller bearings, rolling 30-in. to 36-in. wide 16-gage strip at delivery speeds of about 800 ft. a minute, impose loads on the finishing stand motors of about 1500 hp., indicating a saving in power requirements of about 40 per cent. On some mills roller bearings are used on the roughing as well as the finishing stands. But it should be noted that the greatest savings in energy consumption are to be made on the finishing stands, where the rolling pressures are very high."

Standardization of Skid Platforms

Possibilities of the application of a simplified schedule in the manufacture of skids or platforms for use with elevating trucks have been surveyed by the division of simplified practice of the Department of Commerce. At present these platforms are made in a great variety of sizes and shapes. They have been developed in most cases to meet the needs of individual users. While the necessity for special sizes and forms may always exist, a brief survey shows that a wide range of commodities may be loaded on platforms of standard width and height.

Among the main considerations to be taken up at a conference of truck and skid manufacturers, and of railroads and other users, which is to be arranged for by the division, will be cost of manufacture and convenience and conformity to needs of users. In considering dimensions for the platforms, one factor will be economical packing in freight cars. One railroad company has adopted a skid of such dimensions that 24 can be loaded into a standard 50-ft. box car, leaving room opposite the doors for the lift-truck to enter.

Using interchangeable skid and truck equipment, certain shops and consignees have found it possible to save over 75 per cent of the cost of packing and boxing materials and over 90 per cent of the labor cost of loading and unloading freight cars. One paper company now loads a freight car with flat paper stock on skids in 45 min., using

two men. Formerly it took seven men 3 hr. to load the same quantity of goods packed in boxes, and the boxes cost three times as much as the skids, for each carload of goods.

It has been estimated that approximately 9,000,000 skids are now in use in the United States. This gives an indication of the wide application which standardization might find. One railroad company alone, after certain changes are completed, expects to use about 100,000 skids and more than 3000 lift-trucks for handling and storing supplies and other materials.

What Trade Associations Must Do

There are four things every trade association must do, says E. St. Elmo Lewis, of National Services, Inc., Detroit, and they are:

- (a) It must have an aggressive, faithful and competent leadership and a membership loyal to the purpose and plan.
- (b) It must have a plan of action based on a competent, unbiased analysis of the trade's requirements.
- (c) It must have an adequate and competent staff to do the work.
- (d) It must have a program that realizes the necessary time, and a budget that fully covers the expense of putting the plan into execution.

Mass Production Begets Overproduction

Surplus of Goods Natural Result of Mass Methods

—Remedy Lies in Better Distribution and
Regulated Output, Says G. M. Verity

MASS production naturally begets overproduction, and this fact must be recognized by industrial executives if they hope to stay on the road to success, according to George M. Verity, president American Rolling Mill Co., Middletown, Ohio, who recently discussed fundamental economic problems with a member of THE IRON AGE staff. The interview centered in the present dilemma of industry, with mass output expanding as costs are lowered and with increased production, in turn, resulting in more intense competition.

The present era of quantity production is mainly accounted for by the invention of mechanical equipment and the introduction of better processing and fabricating designed to replace less efficient manufacturing methods. A disagreeable by-product of these changes, however, is the tendency of profits in many lines of manufacture to shrink as competition grows keener.

Economists and industrialists alike are perplexed and are trying to find new business principles that will guide manufacturers safely through their current difficulties. When Mr. Verity was asked to name policies he regards as essential to the successful conduct of a manufacturing industry, he pointed out that mass production methods normally tend to result in surplus output and that the remedy, in his opinion, lies in better distribution and effective measures to control production. Severe competition also places new emphasis on the importance of a satisfied and loyal employee personnel. His remarks follow:

"From a marketing standpoint, the successful corporation of the future must have its costs of production so sound that it will be prepared to sell its products at a price that will encourage an increased consumption and still make satisfactory earnings on its capital investment. It is economically impossible to get what might be termed a high price for a product manufactured on the basis of mass production, and industrial executives might as well make up their minds to accept that fact.

Must Find Legal Way to Control Output

"It is true that the rapid growth of mass production through better mechanical methods brings with it the problem of an output that may be in excess of the consuming capacity of the country, except in periods of a peak de-

mand. This is a factor, however, which has evolved from the laudable and necessary effort of every manufacturer within an industry to improve his manufacturing methods. Its presence brings before us for solution the still large problem of distribution, which has now become the most serious and the most important problem confronting industry. In this connection, it seems to me not unreasonable to suggest that in the interest of the public at large some legal way must sometime be found whereby industry can control its production within reasonable bounds.

"The successful corporation of the future must give a maximum of service, fairly and equitably distributed among its clients, its working organization and its stockholders, and it must, at the same time, fully respect the rights of the public at large. It must be efficient in a superlative degree and it must be a good and loyal citizen. The part that it can play in the life of the community in which it is situated has infinite possibilities for good.

"That the replacement of man power by machinery will be productive of serious unemployment is a theory which may well be heavily discounted. What it will do is to eliminate much of the less desirable kind of work, but in its place will be substituted jobs of a higher order which will tend to develop the best ability of the workmen. Furthermore, the heavy influx of labor into this country has been effectively curbed by the enforcement of the present immigration law. With the large natural growth of the United States, its normal industrial needs will increase from year to year, and,

while a temporary displacement of labor may result from mechanical progress at some particular time in one particular line of industry, the opening of new channels of commerce as well as the widening of old channels should more than take care of the number of available workmen.

Esprit de Corps Essential

"The successful industry of the future must be thoroughly integrated in its manufacturing processes and must be large enough to enjoy the lowest possible costs of production and distribution in line with the best practical and scientific standards of the day. One of the fundamental factors which it must possess is a fine spirit of cooperation and great efficiency in organization and in management. It must respect the highest standards of compensation.

"THE rapid growth of mass production through better mechanical methods brings with it the problem of an output that may be in excess of the consuming capacity of the country, except in periods of a peak demand."—

GEORGE M. VERITY

Yet wages and salaries are, in truth, only a secondary matter, for they in themselves will not create loyalty and the spirit of cooperation which must exist if the greatest results are to be accomplished. The minds and the hearts of all those a part of a working organization must be reached in order to get them to respond in behalf of the common good and to adapt themselves willingly to changing conditions. If this is not done, modern technical achievements in industry would in many cases be far less effective than they are and, in some cases, would be entirely impossible.

"Years ago companies paid slight attention to the working conditions of their employees. Gradually, however, a social consciousness was created and effort was put forth to provide better sanitation, more comfortable working quarters, safety devices and other means enabling men to do their work to better advantage. All these things were done within the four walls of the industrial plant.

Paternalistic Attitude Toward Employees to Be Avoided

"But it was not long until companies realized that what their men did outside the plant also was of great importance. Consequently, attention was given to the matter of

helping them acquire adequate and attractive homes and of helping to make the conditions surrounding their domestic life as happy as possible. Care necessarily had to be exercised to avoid assuming a paternalistic attitude, and the plan that has been supported by many companies has been one of mutual helpfulness rather than that which might bear the malodorous title of 'welfare activities.' In our own company, we have an example of what has been accomplished in that line, as the majority of our men are home owners.

"The importance of the human side of industry cannot be stressed too much, for upon its natural and healthy development depends not only the success of pioneering in mechanical, technical and metallurgical fields, but in solving of the daily problems of production and distribution. The creation of an esprit de corps, the feeling that all are working for a common cause, is the groundwork or setting back of important discoveries and of the solution of what is often regarded as an inexplicable problem. Selfish motives are effaced and the good of the organization becomes the major consideration. The strength of industry, as in an army, is in its organization. The right men, properly trained, properly placed and fully instructed and inspired, can often accomplish the seeming impossible."

Using Heavy Steel Beams in the Desert

SOME of the difficulties involved in building a bridge over the Grand Canyon of the Colorado River may be visualized in the two illustrations. This work is being done by the Kansas City Structural Steel Co. Every beam has to be hauled 150 miles by truck over exceedingly rugged country. It was necessary to build a temporary town to take care of the needs of the workmen, and to maintain a fleet of motor trucks to haul in their supplies from the nearest railroad point.

AT Right Appears One End of the Bridge Jutting Out from the Rugged, Stratified Wall of the Canyon

HAULING Heavy Steel Girders Over Rough Country by Means of Motor Trucks and Trailers on Roads Which, in Part, Had to Be Prepared for Their Use

Star Return Tumbling Barrel for Forgings, Stampings and Castings

IDEAL Industrial Machinery, Cincinnati, has developed a new star return tumbling barrel for tumbling drop forgings, heavy stampings and castings. The parts are tumbled with stars or slugs, together with flint shot,

silica sand or steel shot, the weight of stars being approximately equal to the weight of the parts to be tumbled. In this way the parts are prevented from touching each other, being floated in the stars. The re-

Work Is Charged By Means of a Power Loader and Is Discharged Automatically. The stars return to the tumbling compartment automatically

sults achieved, it is claimed, are not to be distinguished from a sand-blasted finish. It is stated that scale is removed even from alloy steel forgings without denting the work and without destroying the corners or designs on the parts.

Work is charged into the barrel by means of a power loader. In discharging, the rotation of the barrel is reversed, and the work automatically comes out at the end of the screen. The stars and sand are separated and fall into a cone-shaped jacket, which surrounds the screen. When the barrel is again rotated in the tumbling direction, the stars automatically return to the tumbling compartment. A minimum of labor is involved.

Transfer and separation of the stars is accomplished by means of a patented cup arrangement in the head between the tumbling compartment and the cone which surrounds the separating screen.

Machines are built in a range of sizes with tumbling compartments that measure from 18 x 24 in. to 48 x 60 in. Rigidity of construction for the hard usage they are intended for is a feature stressed by the manufacturer. Barrels are equipped with a hood for connection to the standard exhaust system. It is planned to show the equipment for the first time at the forthcoming International Steel Exposition, to be held in conjunction with the annual convention of the American Society for Steel Treating.

Diesel Generating Set Furnishes Direct Current for Crane Operation

WHILE alternating-current electrical energy is almost universally furnished by central-station companies, many plants require direct current in some phase of their manufacturing processes. Overhead traveling cranes, if the advantages of dynamic braking are to be gained, require direct current. Dynamic braking cannot be obtained with a. c. motors, because they cannot be automatically reversed. But d. c. motors can function as generators and provide effective and efficient means of braking. In addition, d. c. motors afford high starting torque and close speed regulation, both important considerations in crane operation.

To provide a source of direct current for this purpose, an engine-driven generating set has been put out by the Buda Co., Harvey, Ill. The set illustrated consists of a Diesel engine direct-connected with a 65-kw., 900-r.p.m., 250-volt, 260-amp., d. c. generator. It furnishes power to three 5-ton cranes and one 3-ton crane, which are operated in a foundry and machine shop. The 5-ton cranes are equipped with 11-hp. motors on the hoist and bridge and 3-hp. motors on the trolley, while the 3-ton crane is equipped with 5-hp. motors on the hoist and bridge and a 2-hp. motor on the trolley.

As the cranes in the foundry operate on a 24-hr. schedule six days a

week, there is a continuous demand on the generating set. The load fluctuates from 1 to 300 amp., and often increases instantaneously from zero to maximum. This set is said to provide continuous service, and to withstand the wide variation in load, without greatly affecting the voltage regulation. The engine, built under li-

cense from the M. A. N. Co. of Germany, is of the four-stroke-cycle type, and fuel is injected without the use of an air compressor. It is provided with a self-starter, and no heating devices are required.

With low-priced fuel oil, electricity can be generated at as low as ½c. a kwhr. for fuel and lubricating oil.

Self-Contained Generating Set Consisting of a Diesel Engine Direct-Connected with a 65-Kw. 250-Volt Direct-Current Generator

Strainers for Fuel Oil and Other Fluid-Conveying Systems

STRAINERS of single and duplex types, for use in connection with systems for conveying fuel oil or other fluids, such as water, tar, paint, chemicals, steam and air are being marketed by the Anthony Co., 138 West Avenue, Long Island City, N. Y. In removing foreign matter from the

the inside of the strainer basket so that sediment accumulates in the reservoir which surrounds the basket. A connection is provided at the bottom

The Blow-Out Arrangement Permits Purging the Baskets Without Interruption to Flow of Liquids in the System

liquids, the device is said to eliminate a common cause of worn pumps, leaky valves, inaccurate meters, clogged controls and clogged nozzles. Both types of strainer are adapted for either suction or pressure lines.

The single strainer is made up of a body, cap, basket, gasket and a drain plug; the duplex type has twin parts, and, in addition, a cut-out cock with handle. The body is of semi-steel and standard baskets are of sheet brass. Each strainer is tested under 500 lb. hydraulic pressure and is suitable for steam pressures up to 250 lb. The single strainers are for use with liquids which contain a small amount of foreign matter and for pipe lines that may be cut out of service temporarily for cleaning. The direction of flow is from the outside to

through which accumulated sediment can be drained or forced out under pressure. For viscous solids, the cap at the top can be removed and the basket cleaned with kerosene or other medium.

Strainers of the duplex type, illustrated herewith, are intended for liquids that contain an appreciable percentage of solids or a trace of viscous residuum and in pipe lines where even temporary interruption to the flow is objectionable. This device has two straining chambers in one body, each chamber being a complete unit within itself. The flow of liquid through both chambers is controlled by one cock, one movement of the handle of which cuts out either chamber, as desired. The direction of flow is from the outside to the inside of the baskets, as in the single pattern strainer. The cleaning operation is simple. The strainer need not be taken apart and tarry and sticky matter is removed from the clogged baskets without burning or washing with kerosene. Drain connections are provided at the bottom.

An outstanding feature of the device is the blow-out arrangement by which all chambers can be purged and the baskets blown free of obstructions without interruption of flow of the liquid. The blow-out connection is located at the top of the strainer, as shown, and when connected to a steam, compressed air or water line, either chamber of the strainer can be cleaned rapidly. Obstructions are blown from the mesh in the reverse direction to the normal flow, and forced with the sediment through the drain.

The duplex strainers are available in three standard sizes, $\frac{1}{2}$, 2 and 4 in., respectively, the nominal size being designated by the pipe size of the inlet and outlet connections.

Offers Tubular Inside Micrometers and New Micrometer Calipers

TUBULAR inside micrometers, in three sizes to measure from 12 to 22 in., 22 to 32 in. and 32 to 42 in., respectively, have been added to the line of the Brown & Sharpe Mfg. Co., Providence. Each tool is graduated in thousandths of an inch and the range of measurements of each tool is obtained with ten interchangeable anvils of different lengths. The micrometer head has a movement of 1 in.

The shoulders of the anvils fit against the shoulder of the micrometer head, assuring positive alinement and accurate measurements. The anvils are held in place by a clamp-

screw which fits into a V groove and may be changed conveniently. Adjustments may be made quickly and the micrometer locked at any reading. The measuring points are hardened and the faces are ground on a radius, which adapts them for measuring parallel or curved surfaces. Metric micrometers of this type are also available.

Two new micrometer calipers, designated as the Nos. 60 and 62, have also been announced by the com-

pany. These tools are similar to the company's Nos. 61 and 63, except that they do not have clamping rings. They are obtainable with graduations in either thousandths of an inch or thousandths of a millimeter. One tool measures from 1 to 2 in. and the other from 2 to 3 in. Both tools have solid anvils and simple adjustment for wear of the measuring surfaces. They are furnished with or without standards and with or without ratchet stops.

The Measurement Range of the Inside Micrometers Is Obtained with the Anvils Shown at the Right

Expansion of Bethlehem Shipbuilding Corporation in Boston Area

Announcement has been made of acquisition by the Bethlehem Shipbuilding Corporation of the Atlantic Works in East Boston. This plant, which has long been established as a ship repair unit, covers 15 acres and has equipment including 22 buildings and two dry-docks. It is located on the main ship channel, directly opposite the United States Navy Yard.

Together with the Simpson Works, also owned by the company, the repair facilities of the Bethlehem company in East Boston now include three steel floating dry-docks, ranging up to 10,000 tons capacity, three graving dry-docks, of which the longest is 465 ft., and three marine railroads, the largest being of 2000 tons. Both these works are located within 10 miles of the Fall River Shipbuilding plant of the Bethlehem organization at Quincy.

Shops at both the repair yards are completely equipped with tools and machines required for any kind of marine and miscellaneous machine and boiler work. The largest graving dock and the largest floating dry-dock are served by a 15-ton traveling crane. Smaller docks and the marine railroads are served by cranes also, of lighter capacity. One feature of the equipment available is a barge fitted with boiler and air compressor, together with welding sets, making it possible to carry out many repairs at steamship berths instead of requiring the ships to be taken to one of the yards.

Standards Approved for Pipe Nipples

WASHINGTON, July 10.—Commercial standards for steel and genuine wrought iron pipe nipples were approved here at a general conference on June 29 of manufacturers of pipe and pipe nipples, and distributors and users of pipe nipples. The meeting was held under the auspices of the commercial standards unit, Bureau of Standards. The approved commercial standards specify that pipe nipples shall be made only from tested new full or short lengths and full-weight steel pipe, free from buckles, bends, kinks, cracks, laminations, imperfect welds, rust, injurious sand marks or any other defects which might affect its strength or serviceability. For steel pipe nipples, the pipe shall otherwise conform in all respects to the American Society for Testing Materials tentative specification for welded and seamless steel pipe, while that for genuine wrought iron pipe nipples shall be in accordance with the A. S. T. M. specification for welded wrought iron pipe No. A72-27.

Effective date for new production and clearance of existing stocks, the conference agreed, should be Jan. 1, 1929. The commercial standards will be subject to annual review for re-

vision by the standing committees. The conference voted unanimously for the adoption of the certification plan of the Bureau of Standards. Under this procedure, the manufacturer of the nipples will, upon request, certify to the purchaser that his commodity is made in conformity with the approved commercial standards.

I. J. Fairchild, head of the commercial standards unit, stated that, before printing the standard, signed acceptances must be received from at least 65 per cent (by volume) of the annual production, as well as a majority of distributors and users.

Freight Rates to Charleston, W. Va., Upheld

WASHINGTON, July 10.—Rates on manufactured iron and steel products, in carloads, from Cambridge, Ohio, and from the Pittsburgh, Youngstown, Johnstown, Pa., and Wheeling, W. Va., groups, to Charleston and Dunbar, W. Va., are not unreasonable, according to a proposed report made last week to the Interstate Commerce Commission by Examiner Thurston B. Johnston, in recommending dismissal of a complaint made against the rates by the Fletcher Enamel Co. and other makers of enamel ware at Charleston and Dunbar. Except from Cambridge and Johnstown the rates are 28.5c. per 100 lb., while from Cambridge and Johnstown they are 25.5c. and 30c. respectively. The complainants had asked for application of the Jones & Laughlin scale, which over short-distance routes ranges from 1.5c. to 6.5c. per 100 lb. less than the rates that are applied.

Keeping Busy the Continuing Need

The biggest problem confronting the nation, and one that will probably confront it for a long time, is that of keeping busy, says F. C. Biggert, Jr., president United Engineering & Foundry Co., Pittsburgh. "The loss of production, the discomfort and downright hardship of our recurring periods of slack operations, amounts to a tremendous total," he believes.

"We still have before us the development of many new products as well as the wider distribution of many already developed," he argues, "and as these developments occur, they will provide jobs for many who are from time to time displaced by new productive methods.

"We still have need for much road building. The development of our navigable waterways is barely begun. Flood prevention should be undertaken in many districts. Water power development should be advanced more rapidly than is now occurring. The Government should be spending much more than it now is upon aviation. Landing fields should be procured and equipped by the Government, instead of leaving this important matter to

private and municipal enterprises. Air ways should be mapped and rights of way secured."

Heavier Freight Movement in Iron and Steel Forecast

WASHINGTON, July 10.—Transportation requirements for iron and steel traffic during the third quarter of the present year are estimated at 454,760 cars, or an increase of 4.8 per cent over the 433,823 cars required during the corresponding period of last year, according to reports received by the car service division of the American Railway Association from the 13 Shippers' Regional Advisory Boards. For the 29 principal commodities, 9,910,768 cars will be required, it is estimated, an increase of about 597,000 cars or 6.4 per cent above the third quarter of 1927. Of the 13 boards, only two, the Central Western and Ohio Valley, estimated decreased requirements. The total number of cars required for coal and coke is estimated at 2,820,897, an increase of 14.1 per cent; for ore and concentrates, 839,352, an increase of 2.7 per cent; for castings, machinery and boilers, 67,875, an increase of 3.2 per cent; for agricultural implements, 42,355, an increase of 8.7 per cent; for automobiles, trucks and parts, 244,510, an increase of 16 per cent, and for petroleum and petroleum products, 653,174, an increase of 10 per cent.

Chrysler Corporation Opens New Engineering Building

A new engineering building for the Chrysler Corporation was opened July 2 with an informal celebration attended by Detroit city officials, leaders in the automotive industry and others prominent in public, industrial and financial circles. The building, which is part of the Chrysler Highland Park plant group, was opened for public inspection on Wednesday, July 4.

Four stories high and containing 960,000 sq. ft. of floor space, the building is a complete motor car factory within itself, with facilities for every process of motor car designing, building and testing. In it the engineering department will design and build experimental cars and parts for all Chrysler products, which now comprise four lines of cars and a line of marine engines.

Civil service examinations are announced by the United States Civil Service Commission for associate and assistant civil engineers with initial salaries ranging from \$2,600 to \$3,700 a year. Applications must be on file with the commission at Washington not later than Aug. 15. Full information may be obtained from the commission or from the civil service board of examiners at the post office or custom house in any city.

Forecasts Large Manganese Ore Output This Year

The placing of calcined rhodochrosite on the market in 1927 indicates that the domestic production of manganese ore in 1928 will probably be materially increased, according to a statement issued by the United States Bureau of Mines, Washington, reporting on shipments of manganese for last year. Noting that there was relatively little change in the shipments of ore containing 35 per cent of manganese or more in 1927 compared with 1926, it was pointed out that a large part of the shipments from Montana, which showed an increase of 4400 gross tons, was calcined rhodochrosite. California, North Carolina and Washington, all of which shipped high-grade ore in 1926, made no shipments in 1927. Shipments of ore containing 35 per cent or more manganese totaled 44,741 tons in 1927, against 46,258 tons in 1926. Shipments of metallurgical ore totaled 27,730 tons. This was an increase of 1200 tons.

Shipments of ore containing 10 to 35 per cent of manganese were less than half as large as those in 1926, amounting to 148,291 tons, against 364,312 tons. The larger part of the decrease in shipments of this grade is accounted for by shipments in Michigan and Minnesota that were classed with ores containing over 10 per cent of manganese in 1926 and fell below 10 per cent in manganese content in 1927.

Shipments of ore containing 5 to 10 per cent of manganese amounted to 1,310,127 tons, valued at \$3,270,560, in 1927, compared with 835,412 tons, valued at \$1,934,381, in 1926, an increase in quantity of 474,715 tons.

Imports in 1927 totaled 622,067 tons, or 308,630 tons of contained manganese, valued at \$8,487,016, compared with 347,378 tons of manganese content, valued at \$11,071,131, in 1926, exclusive of 14,112 tons of ore imported from Cuba.

Coal Supplies for 36 Days

Coal stocks in industries in the United States on June 1 were estimated by the National Association of Purchasing Agents as equivalent to 36 days' supply. Industries varied widely in this respect, however. By-product coke plants had supplies for only 19 days, against 66 days for electric utilities and coal gas plants. The railroads were credited with 36 days' supply, steel mills with 39 days and other industries 35 days.

Tonnage on hand June 1 was estimated at 40,890,000, a drop of 2,780,000 tons from the May 1 figure. There has been a consistent decline in the total reported, ever since Oct. 1, when the aggregate was 60,154,000 tons. Consumption in industries in May is given as 34,844,000 tons, a slight drop from April and the smallest figure since last September.

Estimates of the National Coal Association place the amount of bi-

tuminous coal mined in the last week of June at 8,350,000 net tons. This is about equivalent to the average of the two preceding weeks, as reported by the United States Bureau of Mines.

Graphite Production Last Year

Sales of natural graphite by producers in 1927 amounted to 5207 net tons, valued at \$232,971, a decrease of 263 tons, or 5 per cent in quantity, and an increase of \$13,629, or 6 per cent, in value, compared with 1926, according to the Bureau of Mines, Department of Commerce. The bureau's statistics of production were collected in cooperation with the geological surveys of Alabama, Michigan and Texas.

The decrease in production last year was in the amorphous variety, the crystalline variety increasing both in quantity and value.

The manufacture of artificial graphite in New York decreased from 9448 net tons in 1926 to 5472 tons in 1927, or 42 per cent. Imports of graphite in 1927 amounted to 17,452 tons, valued at \$723,923, compared with 16,166 tons, valued at \$921,233 in 1926, an increase of 8 per cent in quantity, but a decrease of 21 per cent in value.

Sharp Drop in Shipments of Sheet-Metal Ware

WASHINGTON, July 9.—Shipments of galvanized sheet-metal ware in May are reported by the United States Department of Commerce at 190,704 dozens, valued at \$758,953, compared with 237,511 dozens in April, valued at \$875,442. The May total is the smallest since February. It compares with 163,287 dozens a year ago, with a value of \$665,808. For the five months there has been a gain—from 988,727 dozens and \$3,710,727 last year to 1,026,455 dozens, \$3,877,143, this year.

Largest June Building Construction Ever Recorded

Building construction contracts placed in June are reported by F. W. Dodge Corporation at \$650,466,000. This is the second largest total ever reported for one month, having been exceeded by about 2½ per cent in May of this year. It was 3 per cent ahead of the high record made in June, 1927, and far exceeds any other June. For the first six months of the year the total has been \$3,445,000,000. This is the largest first half-year on record, representing an increase of 8 per cent over the first half of last year.

Residential buildings in June accounted for \$258,084,000, or 40 per cent of the total. Public works and utilities amounted to \$130,852,000, commercial buildings to \$93,942,000 and industrial projects to \$63,537,000.

Contemplated new work reported in June amounted to \$1,030,095,000, being 17 per cent ahead of May and 41 per cent above a year ago.

June contracts in New York and northern New Jersey were the largest for the month ever recorded, but were lower than in May. The same is true of the Middle Atlantic States and of Texas. In the Southeastern States the June total ran ahead of May. In New England, the Pittsburgh district and the Central West June made the second highest showing ever reported for that month.

Estimates of the Associated General Contractors of America placed the June volume of construction at 244, on a basis of 100 as the average for 1913. The current figure is contrasted with 212 in June last year and with a previous high total of 238 in August last year. The figure for May was 185.

Gain in Locomotive Shipments

WASHINGTON, July 9.—Railroad locomotives to the number of 51 were shipped in June, against 41 in May, according to the Department of Commerce. Of the June shipments, 39 were steam and 11 were electric locomotives for domestic account. One steam unit was shipped abroad. For the six months ended with June 314 locomotives were shipped, compared with 570 for the corresponding period of last year. In June, 1927, the total number was 89.

Unfilled orders July 1 called for 201 locomotives, compared with 220 on June 1 and with 400 a year ago. Of the current unfilled orders 161 are for steam and 40 for electric units. Foreign buyers account for 52 and three respectively.

Steel Works Employment Almost Stationary

Employment in 196 establishments making iron and steel total 265,197 in May, compared with 265,713 in the same establishments in April. The reduction was 0.2 per cent. There was an increase of 2.4 per cent in the total amount of payroll, the advance being from \$8,275,366 to \$8,471,115 for corresponding weeks in the two months.

Meantime 996 establishments in the foundry and machine shop group showed an advance from 233,951 on the payroll in April to 238,290 in May—an increase of 1.9 per cent. The amount on the payroll went up correspondingly from \$7,017,127 to \$7,205,634, or 2 per cent.

Machine tool plants to the number of 153 showed an increase of 2.7 per cent in number on payroll and 2.5 per cent in amount of payroll. Structural ironwork advanced 3.7 per cent in number on payroll and 6.1 per cent in amount of payroll, while cast iron pipe plants advanced 3.1 per cent under both heads.

Ingot Production Makes New Record

First Half 639,000 Tons Ahead of Previous Highest Half-Year—
Gain Over 1927 Almost 1,000,000 Tons

PRODUCTION of open-hearth and Bessemer steel ingots in the United States in June is calculated by the American Iron and Steel Institute at 3,742,964 gross tons. While this is the smallest total for any month of the year as yet, it is greater than the production of any month in 1927 subsequent to May. The six-month total is calculated at 24,792,883 tons, against 23,807,387 tons for the first half of 1927.

Previous to this year, the highest output for any half-year was that of the first half of 1926, at 24,153,809 tons. That figure included crucible and electric steel ingots, which are not included in the current figure. Hence, the apparent increase of 639,074 tons over the previous record becomes considerably greater if allowance be made for the tonnage no longer reported. As that class of ingots in 1927 aggregated 378,974 tons, it may be fair to allocate 190,000 tons

of crucible and electric steel ingots to the first half of this year, thus making the total about 24,983,000 tons, which is 829,000 tons (or 3½ per cent) higher than the previous record.

On the daily basis, the June production in 26 working days was 143,960 tons a day. This shows a drop of about 8 per cent from the figure for May and about 17 per cent from the high record figure of April. For the six months, the average for 156 working days was some 5300 tons greater than the average for the first six months of 1927, which had only 155 working days.

Practically the entire gain in six months over last year was in the open-hearth classification. Disregarding the tonnage of the small proportion of companies not reporting, the total was 20,213,141 tons, or close to 1,000,000 tons above the 19,226,735 tons of last year. Bessemer ingots, on the other hand, showed a drop of 50,000 tons, or 1½ per cent.

Estimating production in June of electric and crucible steel ingots at 1400 tons a day, the total for the month appears to have been about 145,360 tons for each working day.

Present Clock to Louvain University

Formal presentation to the University of Louvain of a clock and carillon for the tower of the new library was made July 4 by the War Memorial Committee of American Engineers. The ceremony took place in connection with the dedication of the library. The address of presentation was handed to the secretary of the university, Leon Van der Essen, by Dr. Edward Dean Adams, New York, committee chairman and representative of the Engineering Foundation.

The address recited in part: "To the glory of God and in memory of their fellow engineers who died in service during the Great War 1914-1918, the engineering societies of the United States of America present to the University of Louvain the carillon and the clock installed in the tower of the library of the university, the endowment fund of \$10,000 for their maintenance, the honor roll of those who died, and a record of the names of all those whose contributions have made this memorial possible."

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Testing the "Graham Idea"

IN a mechanical age the importance of the individual is overlooked. We give credit to mass production, to system, to scientific management, to standardization, or to some other abstract concept, but frequently forget our dependence, in the last resort, on human qualities.

As pointed out by Magnus W. Alexander in an address abstracted elsewhere in this issue, production is outstripping consumption in certain lines, and a distribution problem has arisen. Among makers of steel products distribution has been a topic of discussion for several years, but for the most part efforts to find a solution have stopped with general pleas for cooperation.

It remained for Charles J. Graham and other manufacturers of bolts, nuts and rivets to make the first systematic and sustained study of distribution in the steel industry. While their pioneer work has covered only a part of the iron and steel field, it has dealt with a branch having one of the most complex distributing organizations.

Mr. Graham and his associates have traveled from coast to coast at their own expense, and have done much to create a new conception of distribution and to bring about accord, where distrust and unintelligent competition had existed before. They have tried to instill into manufacturers and jobbers alike a sense of responsibility to each other, in the face of ingrained habits of individualism.

What they have attempted is not comparable with the purposes of the price pools of former days. The pools were frankly intended as a means of raising prices and thereby increasing profits. Today, mass production calls for mass demand, and it is realized that high prices mean idle plant and equipment. In fact, the present tendency to overproduce has created a new need—that of preventing prices from going to ruinously low levels.

It was to find a way, within the law, to throw the brakes on falling prices, and not to raise them, that the bolt, nut and rivet industry undertook to reorganize its distribution. If what has been done does not stand the test of time, it will be because the many independent business units involved are not yet capable of group thinking. It is obvious that the economic security of the individual depends on the stability of the entire industry; but a more short-sighted selfishness, taking into account immediate gain only, may prevail.

The plan adopted for bolts, nuts and rivets, which will be extended to other iron and steel products if the recent New York distribution conference bears fruit, is a test of men rather than of principles. It will succeed

only if those called upon to cooperate for the common good have the vision of those who initiated the movement.

A Record Half-Year

NOT only has the production of steel ingots made a new high record in the half-year just ended, but building construction has scaled new heights and the output of automobiles, after a slow start, has exceeded that of all half-years save the first half of 1926. Ingots, after making allowance for the crucible and electric steel tonnage, no longer reported by months, topped the 1926 record of 24,153,809 tons by about 850,000 tons, or 3½ per cent. New building construction, at \$3,445 millions, was 8 per cent ahead of last year, with June running up the highest total ever recorded. Automobile production (United States only) was about 2,200,000 cars and trucks. This is 150,000 less than in the first half of 1926, but 50,000 more than in any other half-year.

Railroad traffic does not hold up to some previous records. Car loadings and tonnage moved are not impressive, as compared with the figures for 1926. But the story of activity told by the figures for steel and automobile and building operations quite warrants the common observation that "business has been good," in spite of the qualification often made of the inadequacy of profits.

Bessemer Steel in the Market

THAT Bessemer steel is superior to open-hearth steel for a variety of purposes was pointed out in an article in last week's IRON AGE by Dr. G. B. Waterhouse, professor of metallurgy at the Massachusetts Institute of Technology and consulting engineer and metallurgist. The merits of the two steels were considered from the technical aspect, and it was pointed out that, in addition to the fact that Bessemer steel, as now made, is preferable for certain uses, there are opportunities to improve the quality further.

Two other phases of the subject may be considered—marketing and cost. Using for illustration Doctor Waterhouse's reference to the superiority of Bessemer steel for high-speed automatic screw stock, that is a specific use involving large tonnages, and the consumers call for Bessemer steel in making their purchases. A large tonnage of merchant bars is sold without the producer knowing just how the bars are going to be used. Some will be used one way, some another. In a general way open-hearth would cover all the uses,

while in some of them, perhaps only a small proportion, there would be objections to Bessemer. Accordingly the seller, when he is a maker of both Bessemer and open-hearth, elects to ship open-hearth. This is not theory, but citation of the practice under which much steel is being sold at the present time. Then, too, there are many buyers who have heard things about steel in a general way and have been moved to ask for open-hearth without definite knowledge that it would be more suitable for their purpose than Bessemer.

If the manufacturers wished to push Bessemer steel they would have much ground in which to work. There was a time, years ago, when open-hearth steel promised to be considerably cheaper to make than Bessemer. Events have worked out differently. Construction costs have mounted enormously and that falls more heavily upon open-hearth than upon Bessemer, and the increase in wages operates in the same direction. At one time there was an expectation that the relation of Bessemer and non-Bessemer ore supplies would become such as to make the former much the dearer; but additional discoveries of ore and the decline in consumption have made a condition today quite different from that expected a quarter century ago, when production of Bessemer steel was still showing increases.

It is true there is an argument in the other direction, scrap being cheaper now in relation to pig iron than it used to be. Using composites of THE IRON AGE for comparison, heavy melting steel against all descriptions of pig iron, scrap averaged \$2.12 under pig iron in 1912-13-14 and \$4.74 under in 1926-27. But scrap costs money to gather and transport while ore, coke and pig iron still have opportunities for cost reduction.

Steel makers have been making much progress in linking their various products with the services to which they will be put. It would seem that there is a good outlook for improving Bessemer steel and pushing it into the numerous uses for which it is particularly well fitted, with an advantage to the producer in the matter of cost.

Canada and American Steel

CANADIAN steel manufacturers continue to stress the existing regime of low or moderate duties on their products as a bar to the prosperity they have hoped for year by year but have not realized. President Robert Dodd of the Lake Superior Corporation, which has spent largely for plant extensions at Sault Ste Marie, Ont., in the past few years, complains that American steel companies, "protected by almost prohibitive duties on steel, can afford to sell their product in Canada at a price below production costs in this country" and adds that higher Canadian import duties would prevent this. To the suggestion that in case steel duties were raised American producers would build plants on the Canadian side, he replied that then they would be on a footing with Canadian steel works and their operations would benefit the Dominion in increased employment and in other ways.

It is quite improbable that American steel interests would build works in Canada, even though the Dominion Government raised steel tariff schedules. Canada is too largely agricultural and its urban population gives altogether too little promise of development in the American way to warrant any such move.

Also the hazard of a sudden electoral reversal of any policy of encouragement to steel manufacture is too great.

As THE IRON AGE has suggested on other occasions, no large part of the steel business our manufacturers have in Canada is done at the expense of the Canadian industry, and little if any of it at prices below production costs in Canada. The administration of Canada's anti-dumping laws is too efficient to permit this last, even if producers here ever reached such a degree of demoralization in their selling.

On the basis of last year's operations, Canadian steel works produced roundly 700,000 tons of rolled steel for their home market. Exports of American steel, finished and semi-finished, to Canada are also not far from 700,000 tons. While there is competition between works here and works yonder on certain products, a large part of the shipments from this side is in finished forms which Canadian mills are not equipped to manufacture. Canada, with her limited consumption of many rolled products, does not warrant the building of mills devoted to these lines or of mills equipped to roll the great variety of sizes and shapes which has been made available in this country only by investments running into hundreds of millions. Therefore, for years to come our Canadian neighbors will continue to avail themselves of the unparalleled facilities of American works and at prices which need neither threaten the prosperity of their own steel companies nor put the manufacturing consumer there at any disadvantage in comparison with his competitor on this side of the line.

British Blast Furnace Practice

BRITISH blast furnaces use considerably more iron ore and coke than American furnaces to make a ton of pig iron, but nevertheless they get along with a little less limestone, the native ores being somewhat self fluxing. Statistics of the consumption in 1926 are given in the annual report issued this year by the National Federation of Iron and Steel Manufacturers. A comparison with the blast furnaces of the United States, for the same year, is given below:

Materials Consumed per Ton of Pig Iron—1926

	Britain	United States
Iron ore, gross tons.....	2.3245	1.763
Cinder, scrap, etc.....	0.1715	0.165
Total, gross tons.....	2.4960	1.928
Limestone, pounds.....	878	889
Coke and coal, pounds....	2950	2061

The figures are closely comparable. While 1926 was an off year in British pig iron production, on account of the coal strike, the proportions of material did not vary materially from the average, except for a slight diminution in coal and coke consumption. The British average includes ferroalloys while the United States average excludes them.

It might be thought that the fact that the American industry has been a rapidly expanding one would in itself conduce to the making of improvements, there being so much opportunity in the designing of new plants. This does not apply with so much force to blast furnaces as to other things, for in both Great Britain and the United States the number of blast furnaces has been decreasing, for forty-seven years in the United States and for a longer time in Great Britain. In a British record beginning with 1874

that year is assigned the largest average number of furnaces in blast, 649, there being a substantially steady decrease to date. The United States record, which deals with the number of furnaces in existence, shows 716 in 1881, and decreasing numbers thereafter. At the end of 1927 there were 351 coke furnaces counted as capable of operation (though only 169 were then operating) and thirteen charcoal furnaces.

The early American blast furnaces had much less output per stack than the British. They were charcoal furnaces, but the nature of the fuel was not the reason. Rather it was a matter of geography and transportation, stacks being set up at numerous points where wood and iron ore were available. While American outputs have greatly outdistanced the British, the average being three or four times as great, there has been a certain increase in Great Britain, particularly in the last ten years. The following table shows the average number of British furnaces in blast at decennial periods, with the average annual output in gross tons.

British Blast Furnaces by Decades from 1877

	Number in Blast	Annual Output, Gross Tons
1877.....	541	12,200
1887.....	405	18,700
1897.....	380	23,200
1907.....	369	27,400
1917.....	318	29,400
1927.....	171	42,500

Of course it is chiefly a case of the fitter, and larger, stacks surviving and being in blast, and that is exactly the experience in the United States.

Export Information Developed by Research as an Aid to Foreign Business

Research as applied to export trade and the possibilities for expanding it can furnish information, definite and precise in many cases, along several lines of attack on the problem. As pointed out in a brochure prepared for the Research Committee of the New England Council by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., New York, some of these items are:

- What can be sold.
- Where it can be sold.
- Extent of the possible market.
- What it costs to do business.
- How many buyers there are.
- When they make their purchases.
- What are the best methods to use in getting business.

Personal investigation is urged as highly desirable in carrying on such a research. Sending to the country in question a representative—preferably from the factory—who can talk the language of the prospective customers is said to be the best means of obtaining a foothold in the desired market. Frequently such a trip is made, not with the hope of getting immediate business, but to secure first-hand knowledge of the far-away markets. Personal study of local conditions is thus utilized as a background in extending or inaugurating business connections.

All of this is, of course, in addition to the data and advice obtainable from the United States Department of Commerce. Many times this organization can tell a manufacturer whether it would be likely to be profitable for him to spend his time and money in looking carefully into the proposed outlet for his goods.

Foreign credit conditions often provide a stumbling block unless the subject is studied exhaustively, along the

RAILROAD buying gives little promise of amounting to much in the next few months, from all that came out of the railroad equipment show at Atlantic City. Disappointing as this situation is to those largely dependent on railroad business, the iron, steel and metal-working industries have been enjoying, on the whole, a surprisingly good volume of demand with so little help from the railroads. There is nothing in general conditions to suggest any marked revision of the steel buying schedules maintained lately, and business accordingly is now looking upon any expansion in the calls from the carriers as just so much to be added to a fairly satisfactory running total. Since the Atlantic City gathering, one reassuring development is the appearance this week of four inquiries for steel rails, on top of regular purchases long since closed, and some of the new rails will be put into track this fall.

THE New York Times, whose standard of accuracy, which it does not emphasize, is generally as high as its standard of cleanness, which it does emphasize, had this in an editorial a day or two ago:

Perhaps the phrase is not to be found in the work on agriculture which Secretary Hoover translated from the Latin. . . .

All the "agriculture" in *De Re Metallica*, which Mr. and Mrs. Hoover translated from the Latin, was in the name of its German author, Agricola. While eminently a "dirt" mining engineer, we believe the Secretary has made no claim to recognition as either a theoretical or a dirt agriculturist.

lines of local practices. With such a careful survey it is found that losses from this source may be held within 1 per cent, or even less. In some instances these losses prove lower than those from domestic customers.

Thoroughness, personal knowledge of the field, trust in the dealer abroad and complete sales information by classes of lines are four points stressed as essential to success in developing foreign markets. Complete dealer information, a branch of the fourth item, is needed, also, so that, while there is no effort to coerce dealers, the company is in a position to know what may reasonably be required of them.

To Further the Use of Slag

Manufacture and use of slag products are covered in a 56-page pamphlet issued by the National Slag Association, Leader Building, Cleveland. This is the fourth in a series of monographs, the others having been "Absorption in Slag and Slag Concrete," "Resistance of Blast Furnace Slag to Abrasion and Wear" and "Action of Slag Under High Temperatures and Fire." Primarily the present pamphlet discusses articles made of cement in which the slag is the principal ingredient. Concrete blocks and brick, monuments and a wide variety of other forms are treated, as well as similar articles made from slag-lime combinations, the hydrated lime acting as binder. This process has been employed more extensively in Europe than in the United States, as both the British and the Germans have experimented thoroughly with such products and their manufacture in France is being carried on on a large scale.

Construction costs in June are placed at 198 (1913 average at 100) by the Associated General Contractors of America. Comparing with 196 in May, this is the first rise since September.

This Issue in Brief

Some legal way must be found to control production within reasonable bounds, says G. M. Verity. Mass production methods normally tend to result in surplus output, which means shrinking profits. Industrial executives should make up their minds to accept the fact that it is economically impossible to get what might be termed a high price for a product manufactured on a mass-production basis.—Page 89.

* * *

Die casting may pay, even if the number of parts to be made does not exceed one thousand. It all depends on the amount of costly machining and finishing operations the die casting eliminates.—Page 82.

* * *

Human factor can be removed from reversing valves in open-hearth furnaces by using pyrometer controllers. Thermo-couples can be located at a relatively cool spot in the rear of the checker work, and when temperature reaches the mark at which the spotter on each controller is set, the draft is automatically reversed.—Page 77.

* * *

Arc welding operator's performance is checked by recording shunt ammeter. The character of curves shows the type of work done, when polarity has been reversed, if electrode has been grounded, whether the work has been rushed, etc.—Page 77.

* * *

Is the "Graham idea" the cure for ailing industries? If it fails it will be because the many independent business units involved are not yet capable of group thinking, says IRON AGE editorial writer.—Page 96.

* * *

Steel ingot output establishes new half-year record. Production for six months was 24,792,883 tons, exceeding by 639,000 tons the previous record, made in 1926. June daily output averaged 143,960 tons, 7.5 per cent under May.—Page 95.

Rusting of sheets in storage is prevented by use of recording psychrometer. If record shows atmospheric conditions are favorable to formation of dew, fans are started to circulate warm air throughout the warehouse, preventing moisture from collecting on the sheets.—Page 77.

* * *

Doubts that machinery will be a serious contributor to unemployment. While machinery eliminates much of the less desirable kinds of work, says steel manufacturer, it substitutes jobs of a higher order. Temporary displacements in some particular line will be compensated for by opening of new channels and widening of old ones.—Page 89.

* * *

Even distribution of heat in annealing furnace is obtained by means of "double pass" combustion chambers. Oil and air are mixed in the lower chamber; gases then travel to the upper pass and are admitted to the working chamber through ports dimensioned to provide for proper heat distribution.—Page 80.

* * *

Ford prefers electric furnaces for heat-treating. Low-cost power is plentiful and, though first cost of furnaces is high, ease of control, cleanliness, compactness and non-radiating qualities recommend them. Nickel-chromium in ribbon form is used as a resistor where temperature does not exceed 1500 deg. Fahr.—Page 73.

* * *

"Friction bite" hoist mechanism avoids the use of limit switches on electrode arms in melting furnace. Electrodes are counter-balanced and operating mechanism is equipped throughout with anti-friction bearings. Electrode arms are fastened to one end of a steel cable, which passes over sheaves and around a fiber sleeve on a winch drum and then up to a counterweight.—Page 79.

Insulating open-hearth regenerators will pay for itself within a few months, says insulator manufacturer. Calculates that heat saved equals \$53 per 100 sq. ft. a year. Where insulation is properly proportioned to conditions, highly desirable results are obtained, without detriment to the brickwork.—Page 86.

* * *

High cost of distribution is reflected in the lower percentage of wage earners engaged in productive, as distinguished from distribution, work. In 1870, 88 per cent of those gainfully employed were engaged in production, while now less than 70 per cent are so employed.—Page 83.

* * *

Denies post-war gain in world iron output is below pre-war average. Gains since 1919 will be found to approximate 12-year pre-war trend, says IRON AGE staff writer. "Nothing less than another devastating war will prevent the steady expansion in output called for by the post-war trend," he believes.—Page 81.

* * *

New record for June building construction was established last month. Contracts totaled over 650 million dollars, second largest month on record, and 3 per cent over those of June last year. First half-year was the highest ever reached.—Page 94.

* * *

"Keeping busy," says machinery builder, "is nation's biggest problem and will continue to be for a long time." Loss of production, discomfort and downright hardship in recurring periods of slack operation amount to a tremendous total.—Page 93.

* * *

If you injure another industry by selling below cost you yourself will be adversely affected eventually. Business is interdependent, says head of Industrial Conference Board, and selling part of output at a loss is bound to react disastrously upon the seller.—Page 83.

Pig Iron Output in June Declines

Actual Data Make the Daily Rate 3198 Tons or 3 Per Cent
Less Than May—Net Loss of Nine Furnaces

ACTUAL data covering the operations of blast furnaces in June show almost no change from the estimates published in THE IRON AGE, July 5. The June production was 102,733 tons per day or only 23 tons per day more than the estimate of 102,710 tons published last week.

Total June coke pig iron output was 3,082,000 gross tons or 102,733 tons per day for the 30 days in June compared with 3,283,856 tons or 105,931 tons per day for the 31 days in May. This is a decrease of 3198 tons or 3 per cent for June. In May there was a slight loss of only 0.25 per cent from April. The June production last year was 3,089,651 tons or 102,988 tons per day so that the two months show little variation. Output last month was the smallest for June since June, 1925, when it was 89,115 tons per day.

The Half Year's Production

Production for the half year to July 1 was 18,520,921 tons which is the smallest for that period since 1924 when the output to July 1 was 17,434,492 tons. The record for the first half year was 20,841,530 tons in 1923. An inter-

esting fact is that the merchant iron production, which was about 21,100 tons per day to July 1, this year, or close to 21 per cent of the total daily rate, compares with about 27,400 tons per day or nearly 24 per cent of the total daily rate for the first half of 1923, the record year.

Large Ferromanganese Output

Ferromanganese produced last month was 32,088 tons or the largest since separate records have been published.

Capacity Active on July 1

On July 1 there were 189 furnaces active having an estimated daily operating rate of 100,855 tons as compared with an operating rate of 106,145 tons per day for the 198 furnaces blowing on June 1. Six furnaces were blown in and 15 were shut down during June, a net loss of nine. Of the furnaces blown in two were Steel Corporation stacks, one belonged to an independent steel company and three were merchant furnaces. The Steel Corporation shut down seven furnaces and the independent steel companies blew

*These totals do not include charcoal pig iron. The 1927 production of this iron was 164,569 tons.

Daily Pig Iron Output in June Was About 3 Per Cent Less Than in May; Composite Price Decreases Slightly
Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 415,000 tons

out four. There were also four merchant stacks shut down. These data show a net loss of eight steel-making furnaces and one merchant furnace.

Possibly Active Furnaces Reduced

The Musconetcong furnace of the Musconetcong Iron Works in New Jersey and the Allen's Creek stack of the Tennessee Products Corporation in Tennessee have been abandoned during the last month, while the Tennessee Coal, Iron & Railroad Co. has blown in its new No. 5 Fairfield furnace in Alabama. This reduces the number of possibly active blast furnaces in the United States from 343 to 342.

Furnaces Blown In and Out

Furnaces blown in during May were the following: No. 2 Palmerton furnace of the New Jersey Zinc Co. in the Lehigh Valley; the Sheridan stack of the Lavino Furnace Co. in the Lebanon Valley; one Sparrows Point furnace of the Bethlehem Steel Corporation in Maryland; the Norton furnace in Kentucky (blown in the previous month but not reported); one Lorain furnace of the National Tube Co. in northern Ohio, and the Fairfield furnace in Alabama.

During the month the following furnaces were blown out or banked: One Susquehanna stack of the Hanna Furnace Co. in the Buffalo district; one Bethlehem furnace of

the Bethlehem Steel Corporation in the Lehigh Valley; one Eliza furnace of the Jones & Laughlin Steel Corporation and one Carrie, one Clairton, one Duquesne and one Edgar Thomson furnace of the Carnegie Steel Co. in the Pittsburgh district; the Sharpsville furnace in the Shenango Valley; one Sparrows Point stack of the Bethlehem Steel Corporation in Maryland; one Granite City furnace of the St. Louis Gas & Coke Corporation in Illinois; one South Chicago and two Gary furnaces of the Illinois Steel Co. in the Chicago district; one Pioneer furnace of the Republic Iron & Steel Co. and the Alabama City furnace of the Gulf States Steel Co. in Alabama.

Roller Bearings in Four-High Mills

In a paper on four-high mills, read before the Engineers' Society of Western Pennsylvania, F. C. Biggert, Jr., United Engineering & Foundry Co., Pittsburgh, touched on the roller bearings in such mills. The following are extracts from the paper:

"The roller bearing is thus the crux of the situation. It operates substantially without heat or wear and is particularly adapted to high speed. The only difficulty is that its dimensions precluded its use in ordinary two or three-high mills except under comparatively light rolling loads.

"This difficulty has been removed by using four-high mills where roll diameters may be selected without regard to any factor except the space requirements of the roller bearing. It was the perfection of this combination that started the recent and remarkable change from the long established practice for producing wide thin metal products.

"In a cold mill and at the finishing end of a hot mill where the power requirement is greatest, the saving, due to the four-high roller bearing mill, is approximately 50 per cent, that is, equal tonnages of like sizes, rolled from like slabs, require about one-half the power in a four-high roller bearing mill as would be required in a two-high mill on ordinary bearings.

"At the roughing end of a hot mill, where the metal is thick, this ratio probably does not apply, but the saving in power is substantial there also."

Iron and Steel Markets

Large Summer Production Indicated

Volume of Steel Business Keeps Up, Following Record Six
Months' Output—Prices on Wire Products
Reduced—Declines in Pig Iron

THE coming of summer, frequently a dull period in the iron and steel industry, has brought no sharp reduction in the volume of demand.

Production of steel last month was the largest for any June in 10 years, and, while a decline in output is expected in the current month, leading steel makers are confident that it will not exceed 10 per cent. In support of their forecast is the June increase of 220,187 tons in the unfilled orders of the Steel Corporation, the first gain since February. While part of this increase may have been due to recent pipe line orders and to tin plate contracting, it must also reflect more general covering in other products than recent reports indicated.

The buoyancy of demand is all the more noteworthy because it follows six months of record steel production. Output in that period not only exceeded production in the first half of last year, but was $3\frac{1}{2}$ per cent higher than the previous peak, reached in the first six months of 1926.

Although consumption remains high—and leaders in the trade expect it to be well sustained, even without any expansion in railroad equipment buying—the price situation shows fresh evidence of instability. Foundry grades of pig iron at Chicago and at Philadelphia have been reduced 50c. a ton, and the scrap market is generally weak.

Among some finished steel products, also, prices are giving ground. Makers of wire products have announced a reduction of \$2 a ton on nails, staples and plain wire and \$3 on barbed wire. On nails and staples, however, the new quotations are essentially a formal recognition of prices that certain mills have been naming for some time.

The test of the third quarter quotation of 1.90c., Pittsburgh, on plates, shapes and bars has been further delayed by the willingness of many producers to extend second quarter contracts carrying a price of 1.85c. That there will still be a determined effort to raise the market on these products is shown by advances for the fourth quarter named by Steel Corporation subsidiaries, following the receipt of inquiries for that period. The prices are 2c. at Pittsburgh, 2.10c. at Chicago and 2.15c. at Birmingham.

With considerable tonnage for the third quarter not yet definitely under contract, producers expect current prices on these products to show increasing firmness.

The customary seasonal variations in farm implement production are notably absent this year. Chicago reports that agricultural equipment plants, especially

those making tractors, continue to fall behind in deliveries notwithstanding that they are operating above rated capacity.

No summer lull has developed in the automobile industry. Steel is being ordered freely by manufacturers that are bringing out new models, as well as by builders of low-priced cars, among which the Ford company continues to expand production.

The large volume of steel being placed for construction work is again reflected in fabricating awards, which total 43,000 tons for the week. Included was 14,000 tons for a bridge at Louisville.

Increased steel business is expected in coming months from the oil industry, and steel exports show no signs of falling off. In addition to contracts for 225,000 tons of oil and gas pipe line placed in the last few weeks, there are now 1200 miles of such pipe actively under negotiation, including 435 miles of 10 $\frac{3}{4}$ -in., or 40,000 tons, for a Standard Oil subsidiary.

Business in tin plate is particularly good, supporting a mill operation of 90 per cent.

Rail production is still receding, at Chicago having reached a 60 per cent rate, but the beginnings of the fall buying movement are seen in four inquiries, among them 37,000 tons for the Norfolk & Western and 15,000 tons for the Northern Pacific. Domestic buying of railroad equipment is light, but the Argentine State Railroads have placed orders for 1100 freight cars with American shops.

Current steel output at Chicago ranges from 75 to 80 per cent, while the rate in the Greater Pittsburgh district is 70 to 75 per cent. Chicago production a year ago was 70 per cent of capacity and that of Pittsburgh 65 to 70 per cent. Two years ago, when steel capacity was smaller, the Chicago percentage was 85 and that of Pittsburgh 75.

Steel ingot output for the first half of this year, at 24,792,883 tons, exceeded that of the corresponding half of 1926 by 639,000 tons. Since crucible and electric steel ingots are no longer included in production reports, it is estimated that the gain was about 200,000 tons greater than a comparison of the available figures shows. Hence the increase over the previous record is placed at $3\frac{1}{2}$ per cent.

THE IRON AGE composite for pig iron has declined to \$17.09 a ton, the lowest figure in more than 12 years. The finished steel composite has dropped to 2.326c. a lb., but remains above the low point for the year, which was in January.

Pittsburgh

Steel Sales Surprisingly Good for July—Situation Considered Healthy Notwithstanding Some Price Weakness

PITTSBURGH, July 10.—General sales in the steel market in this district during the past week were surprisingly good when the season is considered, and were rather well spread out. Significance was seen in the fact that during the holiday period most mills were closed down for a minimum of time. Steel works operations are estimated at 70 to 75 per cent of capacity. Excepting a few lines, requirements for consumption are being well maintained and orders for third quarter, when aggregated, represent a good volume. Conditions generally are above the average for this time of the year. Tin plate is particularly strong and mills are operating at about 90 per cent of capacity, and strong pressure is being exerted for delivery. There is expectation of large packs of vegetables and fruit.

While there was a let-up in demand for oil country goods following the recent heavy orders, some large requirements for a pipe line are expected to develop and encouragement has been given by a stronger market for crude oil.

Demand for structural shapes, bars and plates is fair. On the larger tonnages some second quarter contracts have been extended at 1.85c.

Structural fabricators report good business, although most inquiries involve small jobs. The largest contract of the past week, placed with the

American Bridge Co. by the Louisville Bridge Commission for a bridge over the Ohio River between Louisville, Ky., and Jeffersonville, Ind., called for 14,000 tons. Demand from the automotive industry for sheets, cold-finished steel bars and strips is fair, but on the last named product there has been a slight recession, and the market is rather irregular.

The increased production of ingots during the first half and June of the current year, when compared with the corresponding periods of last year, together with the increase in the unfilled

tonnage of the United States Steel Corporation, are accepted as barometers showing the healthy tone of the steel market.

Inquiry for coke and pig iron is extremely dull and neither market has been given a test; meanwhile quotations are unchanged.

Ferroalloys.—There are still last half requirements to be placed, but most consumers of ferromanganese are rather well covered for this period. Inquiry is light. The market is reported to be firm at \$105, Atlantic seaboard, for both domestic and foreign material. Shipments are still being made, however, on old contracts at \$100. Only moderate specifications are being received against contracts for spiegeleisen. The standard grade continues to be quoted at \$31 to \$32, furnace. Consumers of 50 per cent ferrosilicon are covered for the year.

Pig Iron.—Extreme dullness prevails in the market for pig iron. While basic is quoted at \$16, Valley, it is believed to be easy at this figure and that a test might develop a somewhat lower price. Buyers generally are remaining out of the market for third quarter tonnages. No. 2 foundry iron is quoted at \$16.75, Valley. Bessemer

and malleable iron are quoted at \$17, with the former showing a little more strength than the latter. Low phosphorus iron continues to move in small lots at about \$28.25, delivered. While the iron being sold is in small lots, it has been observed that immediate shipment generally is required, and this is taken to indicate that stocks in the hands of consumers are small.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free...	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—The market for sheet bars has settled to a basis of \$32, Pittsburgh, and is quiet. Demand for slabs, which are quoted at \$32 to \$34, Pittsburgh, also is inactive, while light demand exists for billets, the base size of which takes a price of \$32, Pittsburgh, with \$1 differential over that figure for the small sizes. Forging billets are quoted at \$38, Pittsburgh. Demand for soft wire rods, which command \$42, base Pittsburgh, is slow.

Bars, Plates and Shapes.—From the standpoint of tonnage, the market for these hot-rolled products is fairly good, although some buyers still show some resistance to the price of 1.90c., base Pittsburgh. While on the one hand mills are trying to get 1.90c. from the small or occasional buyer, some have extended second quarter quotations to the larger buyers for third quarter. The rather general way in which this has been done leaves room for doubt as to whether the 1.90c. price will become effective in this quarter to important buyers. Fabricators, automobile manufacturers and bolt and nut makers are buying in fair volume. Railroad buying is light. The largest fabricating contract during the week, amounting to 14,000 tons, went to the American Bridge Co. and was awarded by the Louisville Bridge Commission for a bridge over the Ohio River between Louisville, Ky., and Jeffersonville, Ind. The American Bridge Co. also was awarded a contract for 2600

tons for a foundry building for the Chevrolet Motor Co. at Saginaw, Mich. Inquiries coming to fabricators are numerous, but for the most part involve only small lots. Demand for iron bars is only moderate and prices remain unchanged.

Rails and Track Supplies.—Only small orders are being placed for light rails, quoted at \$36, Pittsburgh, a small amount of the business coming from coal mines. Demand for both small and standard spikes is quiet. The Norfolk & Western Railroad has put out its annual inquiry for rails, which calls for 37,000 tons, for July-January delivery. This is a somewhat smaller tonnage than this railroad bought in each of the two previous years.

Wire Products.—The card just put out by the American Steel & Wire Co., naming third quarter prices for jobbers, puts into official effect prices that have been prevailing, although representing a 10c. per 100 lb. reduction under some quotations. The outstanding change from the former practice is to put in a 10c. per 100 lb. differential instead of the former 5c. differential as between jobbers and retailers. For this time of year, demand for wire nails and cement-coated nails, quoted at \$2.55 per 100 lb. keg, Pittsburgh or Cleveland, is fair and specifications in July so far have been better than they were in June. Inquiry for plain bright, hard fence wire, quoted at \$2.40 base, per 100 lb., is only moderate, while that for barbed wire is dull, as is generally the situation during the harvesting season. Operations of wire mills range from 50 to 60 per cent of capacity.

Tubular Goods.—New orders for standard pipe are being placed in fair-sized volume, while those for oil line pipe are light, but some good sized inquiries are current and the business is expected to be closed soon. Butt weld demand is fairly active, some of it coming from the building and construction industry. Specifications for mechanical seamless tubing, coming largely from the automotive industry, is satisfactory. Operations of pipe mills in this district range from 60 to 70 per cent of capacity.

Tin Plate.—The Fourth of July hol-

iday, as usual, saw a letup in operations, but the reduction in output was held to a minimum because of heavy requirements before makers. Probably not over an average of four turns was lost. The output generally is at about 90 per cent of capacity. The arrival of warm weather has been an influence in reducing the tonnage somewhat, but also is developing crops which have been backward. Tin plate production for the year to date has been very satisfactory, and present indications are that the output for the year will be relatively better than that of any other steel line. A few consumers, who had not adequately specified for first half contracts, have placed additional orders to cover their requirements.

Sheets.—Sheet makers report that the volume of business is surprisingly good for this season, which is generally the duller of the year. A number of automobile makers are in production on new models and are taking good-sized requirements. The volume of business for the first half was also good. Prices are neither better nor worse, but seem to be at the bottom. Black sheets are quoted at 2.65c.; galvanized sheets at 3.50c., and blue annealed at 2c., all f.o.b. Pittsburgh. A small amount of car business has been placed, but railroads generally are buying lightly.

Cold-Finished Steel Bars and Shafting.—Indications are that the cold-finished steel industry will produce a larger tonnage during the third quarter of the year than it did during the corresponding period of last year. This is partially due to the demand from the Ford Motor Co., which was not in the market one year ago. Automobile producers continue to place fair-sized orders for cold-finished steel bars, which are quoted at 2.10c., Pittsburgh. Implement manufacturers and jobbers are also taking moderate tonnage.

Hot-Rolled Flats.—Specifications during the past week showed a recession, although they continue to be fair. The letup was probably due to the Fourth of July holiday. Automobile makers are rather well covered for their third quarter requirements.

Cold-Rolled Strips.—As in the case

Pig Iron

July 10, 1928, \$17.09 a Gross Ton

One week ago.....	\$17.25
One month ago.....	17.23
One year ago.....	18.59
10-year pre-war average.....	15.72

Based on average of basic iron at Valley furnace and foundry irons at Chicago, Philadelphia, Buffalo, Valley and Birmingham.

	High		Low	
1928	\$17.75,	Feb. 14;	\$17.09,	July 10
1927	19.71,	Jan. 4;	17.54,	Nov. 1
1926	21.54,	Jan. 5;	19.46,	July 13
1925	22.50,	Jan. 13;	18.96,	July 7
1924	22.88,	Feb. 26;	19.21,	Nov. 3
1923	30.86,	Mar. 20;	20.77,	Nov. 20

of hot-rolled flats, demand for cold-rolled strips has shown a slight falling off, but not to the extent usual at this time of year. Operations vary, but are holding up well, and it is likely that the July rate will not be more than 10 per cent below that of June. Prices on some of the larger tonnages are somewhat easier. The bulk of business takes a minimum level of 3c., base, while for lots of 3 tons or more the going quotation is 2.75c.

Bolts, Nuts and Rivets.—Buyers of bolts, nuts and rivets continue to specify regularly, most of the buying being on a hand-to-mouth basis. There are a great many rush orders. Railroad buying is light. Operations are at about 60 per cent of capacity.

Coke and Coal.—The market for fuel continues to lag and prices are unchanged. Inquiry for coal is light, although there has been a slight improvement in the movement of Lake cargo tonnage. Consumers generally have good-sized stocks on hand and are not expected to come into the market actively in the immediate future. Demand for coke also is small, and the limited buying that is taking place covers only small lots for spot delivery of both furnace and foundry fuel. Only three merchant furnaces are operating in the Valley, which is reflected in the light inquiries for 48-hr. fuel. Foundry operations are estimated at about 50 per cent of capacity, and this has resulted in limiting activity in the market for foundry coke. Little third quarter contracting has been done, though some contracts have been quietly renewed and a number of negotiations are under way.

Old Material.—Further weakness has developed during the past week in the market for scrap. A number of grades are down 50c. a ton, while a drop of 25c. has been made on No. 2 railroad wrought. Heavy melting steel continues to take a range of

\$13.75 to \$14.25, and is easy at this spread. Buying is so limited that a real test of the market has not been made. The weak tone is due partly to the fact that dealers who were short on contracts appear to be practically covered, and also to the little interest shown by the mills. At the same time dealers seem to be not so willing to sell, which would indicate that they do not want to go short on a low market. Purchases that are being made for the most part are only to meet immediate requirements. Dealers who recently covered on heavy melting steel to fill contracts no longer are paying \$14.25. Considerable interest is shown in the Pennsylvania list of 51,000 tons of various grades, on which bids will be closed tomorrow (Wednesday). Some dealers believe that the offering will bring the maximum levels and that it will mean short covering rather than a stronger market. Included in the grades which have dropped 50c. are scrap rails, bundled sheets, heavy breakable cast, heavy steel axle turnings for the open-hearth furnace, shoveling steel turnings, mixed borings and turnings and rails 3 ft. and under. The Norfolk & Western Railroad will close bids on Thursday for approximately 7500 tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$13.75 to \$14.25
Scrap rails	13.25 to 13.50
Compressed sheet steel....	13.50 to 14.00
Bundled sheets, sides and ends	12.50 to 13.00
Cast iron carwheels.....	14.00 to 14.50
Sheets bar crops, ordinary	14.00 to 14.50
Heavy breakable cast.....	11.50 to 12.00
No. 2 railroad wrought....	13.75 to 14.00
Heavy steel axle turnings.	12.00 to 12.50
Machine shop turnings...	9.00

Acid Open-Hearth Grades:

Railr. knuckles and couplers	15.00 to 15.50
Railr. coil and leaf springs	15.00 to 15.50
Rollled steel wheels.....	15.00 to 15.50

Malleable Grades:

Railroad	13.75 to 14.00
Industrial	13.25 to 13.50
Agricultural	12.75 to 13.00

— The Employment and Vocational Guidance Section of the Welfare Council, 151 Fifth Avenue, New York, made up of the non-profit-making organizations, has compiled a list of the organizations which help seekers after employment or in the study of a suitable vocation.

Automobile Business Prospects Good

With production of cars and trucks in the United States and Canada in June approximating 440,000, the total for the first half of the year has gone well beyond the total in the first half of 1927. This gain over last year will be much larger in the last half, primarily because Ford Motor Co. was completely out of production in the last half last year and is now operating at better than 3000 cars daily. This rate is expected to rise to 5000 cars daily during the summer, according to *Automotive Industries*, and to remain at or above this figure throughout the last half.

Keener competition throughout the last half will probably be occasioned by the appearance of a considerable number of new models during July and August. Many cars which have enjoyed unusual sales records during the first half will be continued without change and will be compelled to meet the public interest in the newer models. The fact that the Ford company is still several months behind on orders helps to limit competition in the low priced field but in price fields above this group the sales effort will be much keener.

Export shipments are generally at a higher rate than in any preceding year and promise to continue high throughout the year.

Simplification of Shovels, Spades and Scoops

Preparatory to calling a conference of the standing committee on the simplified practice recommendation concerning shovels, spades and scoops, to consider the revision or reaffirmation of this recommendation, the division of simplified practice of the Department of Commerce, Washington, has been requested to initiate a survey among the acceptors of the simplification to ascertain certain information for the consideration of the committee.

In making announcement of the survey the division stated that past experience of the division with other industries has proved that periodic resurveys covering simplified practice recommendations are essential to keep abreast of current practice, promote greater adherence, insure a larger degree of application and provide the necessary material for the use of the standing committee concerned for an intelligent revision or reaffirmation of each recommendation. The questionnaire being sent out is intended to bring this situation about.

The Stout Metal Airplane Co., a division of Ford Motor Co., Dearborn, Mich., has increased production on its standard, all-metal, tri-motored transport plane so that schedule now calls for two planes a week. The tri-motored transport, of the type which now makes daily trips between Detroit and Cleveland, sells for \$49,000.

Chicago

Foundry Iron Reduced 50c. a Ton—Wire Products Lower, Cast Iron Pipe Up—Steel Demand Fairly Steady

CHICAGO, July 12.—Notwithstanding that iron and steel business is well ahead of the first 10 days of July last year and that the tapering in demand is much more gradual than in the early summer of 1927, there persists among buyers and sellers alike an uncertainty as to prices. Wire products have been marked off \$2 a ton at a time when output averages close to 60 per cent of mill capacity, or within about 5 points of what some believe represents the full consumptive capacity of the country. Chicago producers have cut pig iron 50c. a ton, not wholly as a stimulant to business but to limit boat shipments and to reach farther from the close confines of this immediate territory. The scrap market is dull, with a decided leaning toward lower prices. In contrast to these movements is the determination of some cast iron pipe manufacturers to ask \$2 a ton more for their products.

Two inquiries for 1928 rail requirements, totaling over 50,000 tons, are adding interest to the railroad track supply market. However, this business, even if placed at an early date, will not stem the decline of rail rolling schedules, which now have been reduced to less than 60 per cent of capacity.

The rate of ingot output remains between 75 and 80 per cent of capacity. The holiday last week served as a check to the flow of incoming business to local mills and recovery has been slow, with the result that new sales in plates, shapes and bars have fallen sharply below production. Specifications are about equal to 75 per cent of local mill capacity.

Pig Iron.—Local producers of foundry pig iron have announced price cuts of 50c. a ton, bringing the No. 2 foundry grade to \$17.50, f.o.b. local furnace. The effect of this move is looked for in the curtailment of boat shipments from Lake Erie and an expansion of the narrowed territory now served by local producers, rather than in a sharp stimulant to buying in and near Chicago. Some interest is being shown in third quarter and last half needs, but for the most part 30 to 60-day requirements are as far as buyers care to go. Unsteadiness on scattered sales of silvery is noted. Charcoal iron is being sold in some cases at bargain prices and in other instances at \$24, furnace.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$17.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	18.00
Malleable, not over 2.25 sil.....	17.50
High phosphorus	17.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	21.51
So'th'n No. 2 (barge and rail).....	21.01
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Although \$33, Hazard, Pa., is the price quoted on spiegeleisen, there have been no sales that can be considered as tests. Shipments of ferromanganese are light, following heavy releases against first half contracts at prices more favorable to buyers than those now in effect. It is reported that some users have stored enough of this material to meet re-

quirements for the remainder of the year and that in at least some instances second half contracts will be of little value to sellers.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Competition for oil storage tank materials is unusually keen and it appears that producers in the South and to the east have the edge on most of this business, much of which is for water shipment to Texas ports and fabrication near the place of erection. In view of this situation, there is little in the way of plate tonnage that is in sight either for local fabricators or Chicago steel mills. Specifications against old tank orders are well filled, and in the absence of heavy car purchases, the primary outlet for plate mill products is in the structural field. Highland Park, Ill., will need 200 tons for an elevated water tank. The Chicago Bridge & Iron Co. will build a water tank, requiring 150 tons, for Wilmette, Ill. Reports of prospective large railroad equipment purchases are going the rounds, but there is little tangible evidence of such a move on the part of the Western railroads. The grain movement is getting under way in western and southern Kansas and agencies there estimate that 5 to 10 per cent more cars will be needed this year than last. The Missouri-Kansas-Texas has closed with the American Car & Foundry Co. for 19 baggage and mail cars. Among locomotive inquiries is one for an experimental, high-pressure engine for the Delaware & Hudson and a 2-8-2 type locomotive for the Alaska Railroad. Buyers of plates are now able to obtain deliveries in two to three weeks. Prices, except for delivery to the southwest, remain at 2c., Chicago.

Mill prices on plates, per lb.: 2c., base Chicago.

Structural Material.—Interest in pending structural jobs is centering in the Fine Arts Building, Chicago, which will take 5000 tons, and the Patterson Estate Building, which was originally estimated to require about 2000 tons, but which will be built with a tower, thus increasing the tonnage of steel needed. Litigation over air rights above the Randolph Street terminal (Chicago) of the Illinois Cen-

tral has been terminated, clearing the way for further planning on the Apparel Mart, which engineers now estimate will require between 75,000 and 100,000 tons of structural steel. Miscellaneous inquiries throughout most of the Middle West are in good volume and the outlook is favorable for sustained shop operations during most of the summer. Small and large contracts in late weeks have been in good balance. Some shops are now subletting to other fabricators portions of large contracts, on which the builders are stressing delivery. Notwithstanding that shops are well supplied with work, there appears to be no lessening in the keenness of competition, nor any decided effort to get prices above the low levels reached in the late spring. Prices for structural material are steady at 2c., Chicago.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Reinforcing Bars.—Sales remain moderately active in a market which has been held back by adverse construction weather. Two Chicago public school buildings will require a total of 500 tons. Small contracts are numerous, indicating that where hesitancy in making awards is shown, it is on those jobs where large sums of money are involved. Further tests of prices for heavy tonnages are needed. For 100 tons and less, quotations are firm on both billet and rail bars.

Bolts, Nuts and Rivets.—Specifications from practically all manufacturers are lighter, the most marked decrease being from users of small rivets. Railroads continue to place orders at the rate of late June.

Bars.—Farm implement manufacturers, especially tractor builders, continue to fall behind in deliveries, in spite of the fact that many plants are operating well above their rated capacities. Specifications to mills from this source are fully maintained, and there is no lessening in the rate of steel used by the automobile trade, as judged by shipments from Chicago district mills. Orders from road machinery builders are smaller because the season has advanced to the point where contractors are more concerned with using equipment than in making purchases against work contemplated or on hand. Soft steel bar prices are unchanged at 2c., Chicago. Both new orders and specifications for iron bars have been heavier than at any time previously this year. Prices are steady at 2c., Chicago. Users of alloy steel bars continue to issue specifications at an undiminished rate and new purchases are keeping books well filled. Prices are firm and alloy differentials are being maintained. Specifications for rail steel bars, though lighter, still compare favorably with shipments. Production is being maintained at a high rate as producers bend their efforts to round out stocks. Barn equipment builders are busy. The bed trade is quiet, largely because of the Furniture Show, which is now in full swing. Brazen tubes, made from hard steel, cannot be had in less than five weeks.

Rail steel bar prices are steady at 1.85c., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Wire Products.—Producers have announced price cuts of \$2 a ton on all wire products except barbed wire, which has been reduced \$3 a ton. Wire nails are now quoted at \$2.60 per keg, base Chicago, and plain wire is being quoted at \$2.45 per 100 lb., base, in the local market. Demand from all classes of users is lighter, but mill operations have been cut only a trifle to 60 per cent of capacity, as producers find it advisable to rebuild stocks after the June business, which was the best June in several years. Jobbers for the most part have cleared the heavy stocks of nails built up earlier in the year and again are ordering from producers. Distributors in the South report business as dull. The country trade in the Middle West is still of fair size and in the Northwest it holds above the average of a year ago. Weather conditions in the last week have been favorable to the farmers. Specifications from the manufacturing trade are being issued at an undiminished rate. Prices for wire and wire products are given on page 105.

Sheets.—Prices are holding, but consumer interest is slow. Schedules were not greatly improved following the shutdown over the holiday last week. Hot weather is now having its effect on production. In some quarters it is believed that users are showing more interest in the market and that present low prices will soon induce buying in larger quantities.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Coke.—Prices are firm at \$8, f.o.b. local ovens, as second half contracting comes to a close. Summer inventory periods, hot weather and a reported slackening in demand for foundry products have so far had only

a slight effect on the rate of coke shipments.

Old Material.—Cancellation of contracts and an unusually large number of rejections tell almost the whole story of the Chicago scrap market. Railroad shipments are heavy and there is a surplus of practically all grades. Steel mills are using less scrap and a larger portion of pig iron. Consumers throughout this district feel that there is an oversupply of scrap and that when they need additional tonnage they will buy it at least 50c. per ton below present levels. Dealers readily pay \$9.50 a gross ton for cast iron borings and \$12.50 for heavy melting steel.

Prices deliv'd consumers' yards, Chicago:
Per Gross Ton

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$12.25 to	\$12.75
Shoveling steel	12.25 to	12.75
Frogs, switches and guards, cut apart, and misc. rails	13.50 to	14.00
Hydraul. compressed sheets	11.00 to	11.50
Drop forge flashings.....	9.50 to	10.00
Forg'd, cast and r'l'd steel carwheels	15.25 to	15.75
Rail'd tires, charg. box size	15.50 to	16.00
Rail'd leaf springs, cut apart	15.50 to	16.00

Acid Open-Hearth Grades:		
Steel couplers and knuckles	13.75 to	14.25
Coil springs	15.75 to	16.25

Electric Furnace Grades:		
Axle turnings	12.50 to	13.00
Low phos. punchings.....	14.00 to	14.50
Low phos. plate, 12 in. and under	14.00 to	14.50

Blast Furnace Grades:		
Axle turnings	9.50 to	10.00
Cast iron borings.....	9.00 to	9.50
Short shoveling turnings..	9.00 to	9.50
Machine shop turnings....	6.00 to	6.50

Rolling Mill Grades:		
Iron rails	13.50 to	14.00
Rerolling rails	14.75 to	15.25

Cupola Grades:		
Steel rails less than 3 ft..	15.25 to	15.75
Angle bars, steel.....	14.25 to	14.75
Cast iron carwheels.....	12.75 to	13.25

Malleable Grades:		
Railroad	12.50 to	13.00
Agricultural	11.50 to	12.00

Miscellaneous:		
*Relay'g rails, 56 to 60 lb.	23.00 to	25.00
*Relay'g rails, 65 lb. and heav.	26.00 to	31.00

Per Net Ton		
Rolling Mill Grades:		
Iron angles and splice bars	13.50 to	14.00
Iron arch bars and transoms	19.50 to	20.00
Iron car axles	23.50 to	24.00
Steel car axles.....	15.50 to	16.00
No. 1 railroad wrought...	11.00 to	11.50
No. 2 railroad wrought...	11.00 to	11.50
No. 1 busheling.....	9.50 to	10.00
No. 2 busheling.....	5.75 to	6.25
Locomotive tires, smooth..	12.00 to	12.50
Pipes and flues.....	8.00 to	8.50

Cupola Grades:		
No. 1 machinery cast....	13.50 to	14.00
No. 1 railroad cast.....	13.00 to	13.50
No. 1 agricultural cast....	12.50 to	13.00
Stove plate	11.00 to	11.50
Grate bars	11.25 to	11.75
Brake shoes	10.50 to	11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Rails and Track Supplies.—The Norfolk & Western has inquired for 37,000 tons of rails and the Northern Pacific for 15,000 tons. These are the forerunner of the fall buying movement. The Northern Pacific tonnage is for early 1929 requirements, but is asked for now so that a part can be shipped by water before the close of

Lake navigation. Fully 3000 tons of track supplies will be needed with these rails, but this railroad will take close to 5000 tons to cover maintenance work. Users of light rails have ordered 1300 tons. Rail output in this district is at 60 per cent of capacity. Miscellaneous railroads have purchased a total of 1000 tons of track accessories in the week. The Cleveland, Cincinnati, Chicago & St. Louis has added 800 tons of rails to its contract.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.25c.; angle bars, 2.75c.

Cast Iron Pipe.—Prices for cast iron pipe at \$32, Birmingham, for 6 in. and larger diameters, are strong. In fact, some producers are naming \$34. The National Cast Iron Pipe Co. has taken 1600 tons of 6 and 8-in. pipe for Chicago at \$31.80, Birmingham, or \$40, delivered. This contract carries with it an option to double the tonnage. The United States Cast Iron Pipe & Foundry Co. is reported to be low bidder at St. Paul. The National company has taken 250 tons for Grosse Isle, Mich., and the American Cast Iron Pipe Co. has been awarded 100 tons by Waukesha, Wis. Saginaw, Mich., will buy 4000 ft. of 30 and 36-in. pipe.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$40.20 to \$41.20; 4-in., \$44.20 to \$45.20; Class A and gas pipe, \$4 extra.

Link-Belt Catalog and Engineering Data Book

General catalog 500 has been published by Link-Belt Co., Chicago, Indianapolis and Philadelphia. It consists of 1088 pages and not only covers, in engineering data and list prices, the complete chain, sprocket, power transmission, elevating and conveying and engineering divisions of that company's business, but contains considerable data for which the engineer has use.

In developing this book, it was evidently the purpose not only to make its contents of engineering information so ample that engineers might design plants with materials-handling equipment of a standard character, but also to supply price lists so complete as to enable the experienced buyer to determine net prices of his purchases.

The Gulf States Steel Co. has ordered nine thermal expansion goggle valves, built by the William M. Bailey Co., Pittsburgh, under the patents of F. R. McGee, chief engineer, Mingo, Ohio, works, Carnegie Steel Co. More than 80 of these valves, which are used on blast furnace main gas lines, have been installed in the past year. The valve now being sold is an improvement over one employing the same thermal expansion principle, developed and patented by Mr. McGee about three years ago.

New York

Pipe Inquiry for 40,000 Tons—Building to Take 12,000 Tons of Steel

NEW YORK, July 10.—The pig iron market has shown relatively little activity so far this quarter. Inventory-taking among foundries is largely over, but operations in some plants have been adversely affected by the hot weather. It is estimated that 50 to 60 per cent of the melters in this district have covered their known pig iron needs for this quarter. Comparatively little second quarter pig iron remains unshipped, but in some cases melters overbought and accepted deliveries on all they purchased, with the result that they will have a carryover on their yards. Pig iron sales in this district during the week totaled about 7500 tons. The General Electric Co. has bought 500 tons of high-silicon malleable iron for its Elmira, N. Y., plant. The Crane Co., Bridgeport, Conn., is understood to have closed, in part, against an inquiry for 1200 tons of foundry iron. A New York district melter is in the market for 1000 tons of foundry iron. The Chapman Valve Mfg. Co., Indian Orchard, Mass., has divided an order for 1500 tons of foundry among the Mystic furnace, a Buffalo producer and a third interest. An inquiry for 2000 tons of ballast iron for delivery on the Pacific Coast is before the local trade. Buffalo foundry iron continues to range from \$16 to \$17, base furnace, but eastern Pennsylvania producers have announced a reduction of 50c. a ton to \$19.50, base furnace. For some time they have shaded the market to that extent on sales in this district.

Prices per gross ton, deliv'd New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$20.91 to \$21.91
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 22.52
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

Bars, Shapes and Plates.—In a rather dull market, with activity displayed by sellers rather than buyers, little progress has been made in establishing 1.90c., Pittsburgh, or 2.05c. at Eastern plate and shape basing points as the third quarter prices on bars, shapes and plates. Nearly all mills are willing to extend 1.85c. plate contracts into the third quarter, and although there is some active solicitation of bar business at 1.90c., the common practice is to make this quotation tentatively on prospective business and await developments. The bar market, however, shows somewhat more strength than either plates or shapes, prices on the latter product usually being nominal on account of the difference in basing points of the two largest interests and the keen competition on large and desirable tonnages. Of particular interest in the structural market is the Western

Union Building in Manhattan, which will take about 12,000 tons of shapes. Another large job, for which inquiry will be made in the early fall, is the Kill Van Kull bridge connecting Staten Island and New

Jersey, which will take from 30,000 to 40,000 tons. The Structural Steel Board of Trade reports June fabricated lettings in the metropolitan area as 38,100 tons, compared with 46,000 tons in May and 32,000 tons in June, 1927. These figures do not include bridges, subway work, etc. Lettings during the first half of 1928, amounting to 182,800 tons, registered a sharp decline from the 278,300 tons reported during the corresponding period last year.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Warehouse Business.—Business so far this month is keeping up to the June rate, with activity fairly well distributed over all products. Sheets continue the weakest item, but there is nothing to indicate a further reduction in prices.

Reinforcing Bars.—About 1200 tons of bars will be required for a terminal warehouse in the Bronx for the Lehigh Valley Railroad. No other large pending projects have been reported, but reinforcing steel has not yet been purchased for a section of the subway, noted last week as about to be placed. The Long Island City post office, requiring 275 tons, has gone to the Kalman Steel Co. Most distributors are now quoting 1.90c., Pittsburgh mill, with 2c. occasionally obtainable on small tonnages. Warehouse prices are unchanged.

Pipe.—Interest is centered in a Western pipe line project, requiring approximately 435 miles of 10¾-in. o.d. oil pipe, or about 40,000 tons, which may be placed immediately by a Standard Oil subsidiary. Considerable tonnage of standard butt-weld pipe is being taken in this district, with prices apparently regular and the demand steady.

Sheets and Strips.—The sheet market seems to have become somewhat stabilized, but at levels which are far from satisfactory to the mills. The galvanized material is being sold to jobbers at 3.40c., Pittsburgh, with the general run of small orders at \$2 a ton higher. Black sheets are fairly steady at 2.65c., but concessions of \$1 a ton are occasionally to be had on attractive lots. On the blue annealed product, 2c., Pittsburgh, is representative of the market, with the mills not disposed to go lower under ordinary conditions. Consumers are not anxious to place orders and any irregularity in these prices on all sheet business can be traced to mill competition rather than the pressure of buyers. There is little demand for strip steel. The cold-rolled product is selling at a range from 2.75c. to 3c., Pittsburgh, and 1.85c. is the minimum on the hot-rolled material.

Wire Products.—Reductions by the leading producer of \$2 a ton on nails, staples and wire and \$3 on barbed wire have been followed by most makers and have done much to clarify the price structure on these products. In some respects the move merely amounts to a formal recognition of

Philadelphia

Foundry Iron Down 50c. a Ton—Extension of Second Quarter Steel Contracts Quite General

PHILADELPHIA, July 10.—A decline of 50c. a ton in the price of eastern Pennsylvania foundry pig iron is the first change in that grade since last February. Aside from the reductions of \$2 a ton on wire products, excepting woven wire fencing, and a decline of \$1 a ton on rerolling billets, the steel price situation is virtually unchanged. Steel mills in the East and in the Pittsburgh-Youngstown district have quite generally extended second quarter contracts and second quarter prices on plates, shapes and bars into this quarter, so that the \$1 a ton advance has not applied except to the occasional buyer or on very small lots. Scrap prices are so low as to afford little margin for the shippers, yet the quantities available seem to be sufficient for all needs.

Pig Iron.—With Buffalo foundry iron selling at \$21 or less, delivered in and around Philadelphia, eastern Pennsylvania furnaces have recently lost business at their very doorsteps, and to meet this situation they have reduced asking prices 50c. a ton, or to \$19.50 on the base grade, f.o.b. furnace. This means a delivered price in Philadelphia of \$20.26 for the No. 2 grade, \$20.76 for No. 2X and \$21.26 for No. 1X. Buffalo iron is being offered by one or two makers at \$16 to \$16.50 for No. 2 or No. 2X and at \$16.75, furnace, for No. 1X, though for carload lots higher prices are frequently quoted. Sales of foundry iron in this district have amounted only to a few thousand tons in the last week and carload lots have predominated. Many melters are still taking in iron on second quarter contracts. There has been little third quarter contracting. The largest inquiry is for 3000 to 5000 tons of low phosphorus iron for the Standard Steel Works Co., Burnham, Pa.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.	21.26
Basic (del'd east. Pa.)	\$19.00 to 19.50
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Small users of ferromanganese have quite generally covered their requirements for the last half, but most of the large consumers have made no contracts, and are amply taken care of by shipments against their first half commitments. The price for domestic and imported alloy continues at \$105, seaboard, for spot shipment or on contract.

Billets.—Some mills have reduced prices \$1 a ton on open-hearth rerolling billets for the more attractive lots, now quoting \$32, Pittsburgh. This reduction has not disturbed the price of forging billets so far as Eastern mills are concerned; it remains at \$38, Pittsburgh. Nor will some mills sell high-carbon billets at the \$32 base.

Plates.—Day - to - day orders for plates, mostly small, are sufficient to maintain operations of Eastern mills at 50 to 60 per cent. Plates are commonly selling at 2.10c., Philadelphia, which was the second quarter price, but on some small lots mills are obtaining 2.15c., Philadelphia, the figure at which third quarter contracts were to have been taken. However, the extension of second quarter contracts has been so general that none but the small or occasional buyer is paying more than 2.10c., delivered here. This price is based on 2c., Coatesville.

Structural Material.—Building work continues fairly active. Among the week's awards were a garage and office building in Philadelphia, 2200 tons; a bank building at Wilkes-Barre, Pa., 1100 tons, and a coal breaker at Plymouth, Pa., 1800 tons. The Bethlehem Steel Co. has been awarded the contract for a power house for the Haddon Hall-Chalfonte Hotel, Atlantic City, which is to be welded in the field; 600 tons of steel will be required. Current prices for plain material are usually based on 2c., Pencoyd, or 2.06c., Philadelphia, for carload lots, and 2.08c., Philadelphia, for less than carloads, but \$1 a ton below and above 2c., Pencoyd, have been done. Second quarter contracts have been extended in most

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

prices which some mills have been quoting for months. Wire is now quoted at 2.40c., Pittsburgh, wire nails at 2.55c., and galvanized barbed wire at 3.20c. Wire rods are unchanged at \$42 a ton, Pittsburgh base. Woven wire fencing remains at \$65 a ton to retailers.

Cast Iron Pipe.—The tendency toward a stiffening of prices is accentuated by an advance of \$2 a ton by one Southern maker, announced as effective Monday, July 9, on all new business. This company is now quoting \$33 to \$35, base Birmingham, compared to a previous schedule of \$32 to \$33. Northern foundries continue to quote a range of \$37.60 to \$38.60, delivered New York, practically closing the market to their Southern competitors. Business continues rather dull in municipal as well as private enterprises. Valhalla, N. Y., will take bids on July 18 for 1500 tons of 6 to 16-in., classes C and D pipe, and Washington will close July 11 on 3000 tons of 8 to 16-in. class B pipe.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—The market is very quiet, with prices unchanged at \$3.50 per ton, Connellsville, for standard foundry coke and \$2.50 to \$2.75 for the furnace grade. Special brands of foundry coke are quoted at \$4.85, f.o.b. ovens, and delivered prices are: To northern New Jersey, Jersey City and Newark, \$8.56 per net ton; to New York and Brooklyn, \$9.44 per net ton. By-product foundry coke is unchanged at \$9 to \$9.40 per net ton, Newark or Jersey City, and \$10.06 to \$10.29, New York or Brooklyn.

Old Material.—Weakness in buying prices has become more pronounced during the last week, particularly in iron and steel car axles and No. 1 heavy breakable cast, on which reductions of from 75c. to \$1.25 a ton have been made. No. 1 heavy melting steel is commanding \$12.50 per ton, delivered, and is somewhat more active than other grades in a very quiet market.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.50 to \$9.85
Heavy melting steel (yard)	6.25 to 7.00
No. 1 hvy. breakable cast.	10.50 to 11.00
Stove plate (steel works)	7.00 to 7.25
Locomotive grate bars	7.00 to 7.50
Machine shop turnings	6.00 to 6.50
Short shoveling turnings	6.00 to 6.50
Cast borings (blast furn. or steel works)	6.00 to 6.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles	13.50 to 14.00
Iron car axles	23.00 to 23.50
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25
Forge fire	6.50 to 6.75
No. 1 railroad wrought	9.50 to 10.00
No. 1 yard wrot., long	8.00 to 8.50
Rails for rolling	10.00 to 10.50
Cast iron carwheels	11.00 to 11.50
Stove plate (foundry)	8.50 to 9.00
Malleable cast (railroad)	10.00
Cast borings (chemical)	10.75 to 11.25

Prices per gross ton, deliv'd local foundries:
No. 1 machy. cast. \$14.00 to \$15.00
No. 1 hvy. cast (columns bldg. materials, etc.), cupola size. 12.00 to 13.00
No. 2 cast (radiators, cast boilers, etc.) 11.50 to 12.50

cases, so that the prices announced for third quarter have had little effect. Eastern shape mills are operating at 65 to 75 per cent.

Bars.—The asking price for steel bars is 1.90c., Pittsburgh, but current orders are being accepted by some mills at 1.85c., and second quarter contracts made at 1.85c. have been extended in so many cases that the 1.90c. price applies only on the occasional small lots. Bar iron is quoted usually at 1.80c., Pittsburgh, or 2.12c., Philadelphia, but concessions of \$1 a ton are given on the more attractive orders.

Sheets.—Blue annealed sheet sales are being made at 2c., 2.05c. and 2.10c., Pittsburgh, but the larger buyers are not paying above 2c. Black sheets remain at 2.60c. to 2.65c. and galvanized at 3.50c., Pittsburgh.

Warehouse Business.—Sales by local jobbers in June were fairly satisfactory. The price situation is more stable than at any time in months.

Imports.—The week's receipts from abroad included 6000 tons of iron ore from Algeria, 500 tons of manganese ore from Java, 314 tons of structural shapes from Germany, 92 tons of bars from Sweden, 21 tons of bands from Belgium and 19 tons of bands from Germany.

Old Material.—Notwithstanding the low prices at which many grades of scrap are being sold, there is a plentiful supply. There has been no recent buying of heavy melting steel, but one mill took in a small tonnage of scrap rails at \$13, delivered. A broker is paying \$12.50, delivered Bethlehem, for heavy melting steel against a \$13 order. Bundled sheets have been sold at \$9.50 and machine shop turnings at \$10. While the price tendency is downward, the changes in the past week have been slight.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$13.00 to \$13.50
Scrap T rails	12.50 to 13.00
No. 2 heavy melting steel	10.50 to 11.00
No. 1 railroad wrought	13.50 to 14.50
Bundled sheets (for steel works)	9.50 to 10.00
Machine shop turnings (for steel works)	10.00 to 10.50
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)	10.00 to 10.50
Heavy breakable cast (for steel works)	14.50 to 15.00
Railroad grate bars	11.00 to 11.50
Stove plate (for steel works)	11.00
No. 1 low phos., hvy., 0.04% and under	17.50 to 18.00
Couplers and knuckles	14.50 to 15.00
Rolled steel wheels	14.50 to 15.00
No. 1 blast f'nace scrap	9.50 to 10.00
Wrot. iron and soft steel pipes and tubes (new specific.)	12.00 to 12.50
Shafting	17.00 to 17.50
Steel axles	19.00 to 20.00
No. 1 forge fire	11.00
Cast iron carwheels	15.50 to 16.00
No. 1 cast	15.50 to 16.00
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling	14.50 to 15.00

The Concrete Reinforcing Steel Institute will hold its fall 1928 meeting at Buckwood Inn, Shawnee-On-Delaware, Pa., Oct. 1 to 3, inclusive.

Cleveland

Second Quarter Prices on Plates, Shapes and Bars Renamed —Wire Products Reduced \$2 a Ton

CLEVELAND, July 10.—The uncertainty of the price situation on steel bars, plates and structural material for the third quarter has been relieved by the rather common renaming of the second quarter price of 1.85c., Pittsburgh, after some of the producers had made an earnest effort to get prices on a basis \$1 a ton higher. Not many contracts had been taken at the advance and the 1.90c. price evidently will apply only to small-lot buyers. Cleveland bar mills are quoting 1.85c., f.o.b. Cleveland, for the quarter. Many consumers have withheld contracts, awaiting the definite establishment of the market, and considerable contracting is now expected.

There are increasing evidences in the market of a tendency toward price equalization and readjustment, which apparently is being brought about by the establishment of other producing centers than Pittsburgh as basing points. In this connection there is talk of an advance of the Cleveland base on steel bars to \$2 a ton above the Pittsburgh base. Cleveland bar mills have been using the Pittsburgh price f.o.b. Cleveland.

The price situation was further clarified during the week by the announcement of reductions on wire products and wire rods. With the new prices there is a real reduction on wire, but the new prices on nails have appeared on sales by some makers recently.

From the standpoint of demand, the most interesting feature of the market is the good volume of specifications that continues to come from the automotive industry and which exceeds expectations. Steel is being ordered quite freely by some of the automobile makers, who are bringing out new models, and by builders of low-priced cars, who are keeping up good production during a period when there is usually a marked seasonal decline.

New business was rather light during the week. Some of the plate mills took a moderate volume of small orders at 1.85c. In the structural field considerable bridge work is in prospect. The Cleveland Union Terminals Co. today took bids on 4000 tons, this being part of the steel recently inquired for grade crossing elimination work.

Pig Iron.—The market was somewhat less active the past week than during the few previous weeks, which

probably was partly owing to the holiday. Sales by Cleveland interests during the week amounted to 19,000 tons. A few fair-sized lots of foundry and malleable iron were placed in the Cleveland territory, including a purchase from Cleveland furnaces by the Westinghouse Electric & Mfg. Co., for its Cleveland plant. There is not much activity in Michigan. The automobile industry in that State has been rather slow in coming into the market for the third quarter. However, shipments to automobile foundries are holding up well, some of them against contracts carried over from the second quarter. There are virtually no changes in prices. While one local producer is holding at \$16.50 for foundry and malleable iron for outside shipment, Lake iron is still available at \$16.25 or lower for shipment to highly competitive points. Foundry iron can be had at \$16.50 in the Valley district, although one producer made several sales during the week at \$17. Some Valley iron is being sold at that price in Cleveland for mixture purposes, although the cost to the consumer is 76c. more a ton than on local iron. The market is firm in Michigan at \$17.50. The basic market is inactive. Shipments this month have started out in about the same volume as during June.

Prices per gross ton at Cleveland:

N'th'n fdy., sil.	1.75 to 2.25	\$18.00
S'th'n fdy., sil.	1.75 to 2.25	21.50
Malleable		18.00
Ohio silvery, 8 per cent.		28.00
Basic Valley furnace		16.00
Stand. low phos., Valley furn.		26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Semi-Finished Steel.—A price reduction of \$2 a ton to \$42, Cleveland, is announced on wire rods. There had been some shading recently to this price.

Sheets.—Prices are holding at recent levels, having reached a point below which producers are not inclined to go, and effort is being made to get quotations on a slightly higher basis. Some contract tonnage was taken during the week at 2.60c. for black sheets, although 2.65c. is the more common price. On galvanized sheets 3.50c., Pittsburgh, appears to be the top of the market, but some business is going at 3.40c., Pittsburgh, and 3.45c., Valley. Blue annealed sheets are steady at

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.75c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands	3.65c.
Cold-finished strip	5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue ann'd sheets (No. 10)	3.25c.
No. 9 ann'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

1.90c. to 2c., Pittsburgh. Small lots in some cases bring 2.10c.

Strip Steel.—The demand for hot-rolled strip is holding up quite well, particularly for narrow material. Regular prices on narrow strip are well maintained, but large consumers of 6-in. and wider strip are getting shipments at net prices that figure back to 1.75c., Pittsburgh, or lower. Mills that have taken contracts at the regularly quoted prices complain that they are not getting specifications. Large consumers of cold-rolled strip are able to place orders at 2.65c., Cleveland, for 3 tons and over.

Wire Products.—Irregularities that have existed for some time in prices on wire nails have been recognized by a price reduction of 10c. per keg to \$2.55, Cleveland and Pittsburgh, which has recently been a common price. A similar reduction to 2.40c. per lb. has been made on plain wire, which has been holding fairly firm at the former price. Other wire products are correspondingly reduced. On barbed wire the reduction is \$3 a ton.

Reinforcing Bars.—The Cleveland Union Terminals Co. is inquiring for several hundred tons for buildings being erected in connection with the terminal development. Rail steel bars are unchanged at 1.75c., mill.

Iron Ore.—On July 1 there was 5,067,786 tons of Lake Superior ore on Lake Erie docks, compared with 5,050,692 tons on the same date a year ago.

Fluorspar.—The \$1 a ton advance on gravel fluorspar to \$17 mines has been generally adopted. While some small lots have been sold at the advance, not much activity is expected during the remainder of the year, as most consumers are under contract.

Semi-Finished Steel.—Specifications continue in good volume. The leading local producer is still operating its plant at 100 per cent of capacity. Local prices are unchanged at \$32.50 to \$33, Cleveland, for sheet bars, billets and slabs.

Coke.—Foundry coke shipments against contracts are fair, but there is little new demand. Buying is from hand to mouth. Connellsville foundry coke is available at as low as \$3.25 per ton, with quotations ranging up to \$4.85 for the base grades. Ohio by-product coke is quoted at \$7.75, Painesville, for July shipment.

Alloy Steel.—Orders have come out this month better than had been expected and better than during much of June. Some specifications are coming from automobile companies that are anxious for early delivery. Prices are being maintained.

Bolts, Nuts and Rivets.—Several of the automobile companies are ordering bolts and nuts freely and specifications on the whole are quite satisfactory. Rivets are moving in somewhat larger volume than recently. Most buyers have placed contracts at regular prices.

Old Material.—Activity during the week was confined to a limited amount of buying by dealers to cover against contracts. The market lacks strength. Machine shop turnings, which advanced recently when a purchase by a Cleveland mill created a local demand, have declined 25c. a ton, dealers making some purchases at \$7.25. Odd lots of No. 1 heavy melting steel are being picked up by dealers at \$13. Blast furnace grades are holding at the recently reduced prices. Cast scrap is weak.

Prices per gross ton, deliv'd consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$13.00 to \$13.25
No. 2 heavy melting steel.	12.50 to 12.75
Compressed sheet steel.	12.50 to 13.00
Light bundled sheet	
stamp'gs	11.50 to 11.75
Drop forge flashings.	11.50 to 11.75
Machine shop turnings.	7.00 to 7.25
No. 1 railroad wrought.	11.50 to 12.00
No. 2 railroad wrought.	13.50 to 13.75

Railroad malleable.	15.00 to 15.50
Rails for rolling.	16.25 to 16.50

Steel Corporation's Orders Increased in June

Unfilled orders on the books of the United States Steel Corporation increased during June. The total on June 30 was 3,637,009 tons, compared with 3,416,822 tons on May 31—an increase for June of 220,187 tons. This compares with 3,053,246 tons on June 30, 1927. The table gives the reported figures for the past 18 months.

	1928	1927
Jan. 31.....	4,275,947	3,800,177

Dec. 31.....		3,972,874

At the end of April, 1917, the highest total in unfilled orders of the Steel Corporation ever attained was reported at 12,183,193 tons. The lowest figure ever reported was 2,754,757 tons, Dec. 31, 1910.

The Pratt & Whitney Aircraft Co., Hartford, Conn., has received an additional order for 72 airplane engines and numerous spare parts from the United States Army, deliveries to run into next spring. It is the largest individual order for motors received by the company from the Army and involves \$671,620.

Steel Corporation Sues for Over-Payment of Federal Taxes

The time limit within which the United States Steel Corporation and affiliated corporations could file suits for refunds of over-payments of Federal income and profits taxes paid for the year 1917, expired on July 8. The claims of the corporation and its affiliated corporations for refunds of such taxes have been pending for some time and have been under consideration by the Treasury Department, but due to the magnitude of the task of auditing the returns sufficient time to conclude them has not been available before the expiration of the statute of limitations, July 8. Hence, in order to fully protect its rights, the corporation and its affiliated corporations filed suits in the United States Court of Claims for the refunds they deem lawfully due.

The United States Steel Corporation and affiliated corporations paid approximately \$468,000,000 Federal income and profits taxes for 1917 and 1918. This sum, it is understood, amounts to approximately 8.8 per cent of the total corporate income and profits taxes paid to the United States for the two years stated.

Farm Implement Plant Purchased by Case Company

The J. I. Case Threshing Machine Co., Racine, Wis., has acquired the Emerson-Brantingham Corporation's Rockford, Ill., farm machinery plant and inventories, including widely distributed branch houses, and as noted elsewhere in this issue, takes over operation of this branch of the company Aug. 1, according to an announcement by Charles S. Brantingham, president of the corporation. The Emerson-Brantingham Corporation will continue and expand its industrial products division. The Case purchase rounds out that company's line of threshing machines, farm tractors and combines to include plow, tillage and harvesting machines. The Rockford plant is expected to be considerably expanded under the Case operation.

"On Land—On Water—In the Air," an attractive 24-page booklet issued recently by the Niles-Bement-Pond Co., 111 Broadway, New York, outlines in narrative form how the machine tools, cranes, measuring devices, small tools, gears and other equipment manufactured by the company have met the developing needs of the railroad, the automobile plant, the marine engine shop, the shipyard and the airplane engine shop. Photographs of several of the company's products, with appropriate captions, are reproduced on alternate pages.

Boston

More Active Export Demand for Scrap—Foundry Melt Affected by Inventory-Taking

BOSTON, July 10.—Interest in the pig iron market centers in an inquiry from a western Massachusetts foundry for 2500 tons of No. 2 plain, No. 2X and No. 1X for third and fourth quarter delivery, which probably will be placed this week. Current bookings are confined to car lots, with Buffalo stacks securing the bulk of business. No. 2X Buffalo iron is freely offered at \$16.50 a ton, on cars furnace, and producers east of Buffalo are meeting that price on a delivered basis. Some sales of Buffalo No. 2X were made during the week, however, at \$17 a ton, furnace, and No. 1X was sold at \$17.50, melters ignoring lower prices to obtain certain brands. A fair tonnage of Indian iron has been sold for deliveries running as far ahead as next October.

Foundry iron prices per gross ton deliv'd to most New England points:

Buffalo, sil. 1.75 to 2.25..	\$20.91 to \$21.91
Buffalo, sil. 2.25 to 2.75..	21.41 to 22.41
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	22.41 to 24.27
Ala., sil. 2.25 to 2.75.....	22.91 to 24.77

Freight rates: \$4.91 from Buffalo, \$3.65 from eastern Pennsylvania, \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.

Coke.—With many New England foundries taking inventory and with the industry collectively operating at not more than 65 per cent of capacity, specifications against last half contracts for by-product foundry coke have grown fewer and New England ovens have caught up on deliveries. New England-made fuel is still \$11 a ton, delivered, within a \$3.10 freight rate zone. Since dealers are well stocked with domestic coke, both for

immediate and future requirements, the market is less active.

Imports.—June imports of pig iron at this port amounted to 800 tons, consisting of 700 tons Indian, 50 tons of Scotch and 51 tons of Dutch iron. This compares with 248 tons imported in May, this year; 1848 tons in June, last year; 4936 tons in June, 1926; and 7967 tons in June, 1925. Imports of ore in June totaled 18,731 tons, made up of 7000 tons from Bizerta, Tunis, 5981 tons from Huelva, Spain, and 5750 tons from Benisaf, Algiers, whereas May imports were 16,828 tons, and those for June, last year, 8300 tons.

Shapes and Plates.—While mills are still quoting 1.90c. per lb., base Pittsburgh, for shapes and plates, they are still protecting the largest New England consumers on third quarter deliveries at second quarter prices. Competition among fabricators is still keen, and they are making low bids on the most attractive tonnages offered. The current week should be a fairly active one in the fabricated steel market. Five Boston & Maine Railroad bridges, requiring 3000 tons of steel, will be awarded, while bids will go in on a number of fairly large tonnages.

Warehouse Business.—There has been a seasonal letdown in the movement of iron and steel out of warehouses, but the weekly turnover averages slightly more than a year ago. Warehouses generally are carrying well assorted but not large stocks, depending on the mills for replenishment. Prices are firm, reports of shading being fewer than they have been in months. It is stated that higher prices on cut nails are in the making.

Cast Iron Pipe.—The Warren Foundry & Pipe Co. has been awarded 100 tons of 6-in. and 8-in. pipe by Chelsea, Mass., and an equal tonnage by Marlboro, Mass. No other municipal let-

tings are reported, and private business is still quiet. Prices on small pipe are holding up well, but larger diameters can be purchased at concessions from regular prices. The market for 4-in. pipe is \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and for 6-in. to 12-in., \$41.10 to \$42.10. The usual \$5 differential is asked on class A and gas pipe.

Old Material.—With one steamer loading 4000 to 5000 tons of steel for Danzig delivery and another scheduled to load within a fortnight, the export market is more active. No. 1 export steel is being taken at \$9 to \$9.25 a ton on dock here, and No. 2 at \$8.75 to \$9. The American Steel & Wire Co. has taken additional lots of long bundled skeleton at \$9.50 a ton, Worcester, Mass. Steel turnings for Pennsylvania steel mill use have been sold at \$5 on cars, shipping point, and for blast furnace use at \$5 to \$5.50, while a Norwood, Mass., foundry has bought stove plate at \$10.50 a ton, delivered. One sale of forge flashings is reported at \$6.10 a ton on cars, shipping point, but the general market appears to be \$6.50 to \$7. The movement of chemical borings is holding up well, with prices somewhat lower than a week ago. No. 1 heavy melting steel shipments are light, with most transactions at \$8.10 on cars, shipping point.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$8.00 to \$8.50
Scrap T rails.....	8.00 to 8.50
Scrap girder rails.....	7.50 to 8.00

Youngstown

Sheet and Tin Plate Mills Active This Week—July-August Ingot Output May Average 70 Per Cent

YOUNGSTOWN, July 10.—Following the holiday interruption, steel companies resumed production this week on a much broader basis, approaching in active steel sheet capacity the year's record scheduling, with 115 of 127 mills under power. Tin plate mills are active at a rate close to capacity, while there has been an appreciable gain in the rolling of hot-strip steel. Leading producers are inclined to believe that production with mid-West independents will average 70 per cent during July and August, comparing with dips in previous years during these two months to as low as 55 per cent. Current independent merchant bar schedules are not above 60 per cent, but represent a gain as compared with last year, when independent output did not top 35 per cent at this season.

One direct result of the proposal to build a 20-mile railroad spur linking the Youngstown industrial district with the Ohio River is expected to be a reduction in freight rates on coal

shipped into Youngstown and Campbell from the western Pennsylvania fields. Principal carriers are considering such a plan. One of the district's leading freight traffic managers

estimates that each year from 9,000,-000 to 10,000,000 tons of coal is shipped by rail into the Youngstown area. By utilizing the proposed 20-mile railroad, it would be possible to ship much of this fuel by barge down the Monongahela and Ohio Rivers, operating throughout the winter as well as during the warmer months. District steel companies are giving more attention to rate problems this year than ever before, in their efforts to reduce costs and place the district on a more advantageous competitive basis.

The Youngstown Sheet & Tube Co. and the Republic Iron & Steel Co. average 70 per cent this week. The former, which has been the recipient of two important pipe orders, involving line pipe in lapweld sizes of steel tubes, has not yet transferred such business to its operating departments. These two orders will materially help the company to maintain a better average operating rate in its tube mill department. Its No. 9 lapwell mill, rolling tubes up to 20-in., has again been placed in action, following idleness of several weeks.

Operations of the Republic company's tube mill department have been low. The Republic company has been making heavy shipments of butt-weld pipe for construction and to jobbing interests.

Youngstown district tube producers have been rather hard hit by curtailment in oil well drilling, and by the

drilling of heavy production wells, which has been responsible for curtailment in drilling operations.

In connection with its Brier Hill plate mills at Mosier, near Youngstown, the Sheet & Tube company has considered the installation of capacity for producing electrically welded pipe, utilizing steel plates.

This week 12 of 20 Valley tube mills are in action; 37 of 53 independent open-hearth furnaces are melting. The Newton Steel Co., producing highly finished sheets, has resumed at a near capacity rate after one week's suspension. High temperatures throughout the mid-West resulted in some loss of production in hot mills.

One of the district's leading fabricating concerns is working on a large order for brake drums for the new Ford car, and is also turning out heavy production of pressed steel parts for washing machines.

The General Pressed Steel Co. has about completed its plant at Newton Falls, and is planning to begin operations.

Earnings statements of district primary steel producers are expected to show up better for second quarter than for first quarter, contrary to expectations. The quarterly financial statement of the Sheet & Tube company will be released the latter part of July. Directors of the Republic Iron & Steel Co. will meet July 18 to consider the second quarter statement of earnings.

named by an Iron-ton producer should continue. In bars, structural shapes and plates there has been a fair amount of business placed in the last week. Quotations for the third quarter are steady at 1.90c., base Pittsburgh, for small miscellaneous lots, with large buyers obtaining material at 1.85c. Bookings of steel sheets by district mills have fallen off somewhat, partially on account of the lull incident to the Fourth of July holiday. Black sheets are selling at from 2.60c. to 2.65c., base Pittsburgh, while galvanized stock for roofing purposes continues at 3.40c., with a shading of \$2 a ton still prevalent for delivery to Southern points. Blue annealed sheets range from 1.90c. to 2c., and automobile body sheets are firm at 4c. Operations of mills remain at about 90 per cent of capacity.

Reinforcing Bars.—Bids are being taken on approximately 1000 tons of bars for a municipal reservoir at Portsmouth, Ohio. Awards in the past week have been in fair volume, but, without exception, have called for less than 100 tons each. Prices are regarded as firm, with new billet bars quoted at 1.85c. to 1.90c., base Pittsburgh, and rail steel bars at 1.80c., base mill.

Warehouse Business.—Local jobbers have announced a reduction of \$3 a ton on steel sheets, effective July 3. The new schedule is 3.90c. for No. 24 gage black, 4.75c. for No. 24 gage galvanized and 3.45c. for No. 10 gage blue annealed. Recent declines in mill prices of sheets are responsible for the downward revision of quotations.

Coke.—Foundries in this district are specifying fairly well against current contracts for by-product foundry coke, although shipments this month are expected to be slightly less than those in June. Demand for domestic grades has fallen off.

Foundry coke prices per net ton deliv'd Cincinnati: By-prod. coke, \$9.02; Wise County coke, \$7.09 to \$7.59; New River coke, \$9.09 to \$9.59. Freight rates, \$2.14 from Ashland, Ky.; \$2.59 from Wise County and New River ovens.

Old Material.—The scrap market remains fairly firm, especially in view of the lack of interest shown by buyers. Steel plants are accepting normal shipments on current contracts, although the temporary shutdown of an important district mill has halted forward buying by that company. Railroad lists on which bids are being taken include the Southern, 7000 tons; Pennsylvania, 50,000 tons; and Norfolk & Western, 6800 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$10.75 to \$11.25
Scrap rails for melting....	10.75 to 11.25
Loose sheet clippings.....	8.25 to 8.75
Bundled sheets	9.25 to 9.75
Cast iron borings.....	7.50 to 8.00
Machine shop turnings....	7.00 to 7.50
No. 1 busheling.....	10.00 to 10.50
No. 2 busheling.....	6.00 to 6.50
Rails for rolling.....	12.50 to 13.00
No. 1 locomotive tires....	12.75 to 13.25
No. 1 railroad wrought....	10.00 to 10.50
Short rails	15.75 to 16.25
Cast iron carwheels.....	11.50 to 12.00
No. 1 machinery cast....	15.25 to 15.75
No. 1 railroad cast.....	12.75 to 13.25
Burnt cast	7.50 to 8.00
Stove plate	8.25 to 8.75
Brake shoes	9.50 to 10.25
Railroad malleable	11.50 to 12.00
Agricultural malleable ...	11.00 to 11.50

Cincinnati

Pig Iron Prices Steady but Demand Light—Scrap Firm in View of Lack of Buying Interest

CINCINNATI, July 10. — Quietness still prevails in pig iron sales, which in the week have totaled less than 2500 tons. Shipments on contracts are going forward at a moderate rate, but inquiries are scarce. A Hamilton, Ohio, melter is expected to buy 5000 tons of foundry iron for delivery during the last half, with the privilege of extending deliveries into the first three months of 1929. There has been no change in prices. Southern iron is firm at \$15.50, base Birmingham, but the tonnage moving north of the Ohio River is negligible. Northern Ohio foundry ranges from \$16 to \$16.50, base furnace, while foundry iron from the Iron-ton district is quoted at \$18 to \$19, base Iron-ton.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable.....	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.19
Ala. fdy., sil. 2.25 to 2.75	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Iron-ton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Following closely on the heavy specifications placed against old contracts previous to the closing of the second quarter has come a lessened demand from consumers, a development not at all surprising to

producers, who are fairly well satisfied with the trend of business. Prices are the strongest in many weeks and the situation in this respect is a source of encouragement to the manufacturers. Eastern mills have announced that common wire nails have been advanced to a minimum of \$2.69 per keg, delivered in Cincinnati, which is equivalent to \$2.55 at Iron-ton plus a 14c. barge rate to this city. Plain wire is firm at \$2.40 per 100 lb., base Iron-ton. Representatives of Eastern companies declare that no concessions will be made from these schedules, even though irregularities in prices

St. Louis

Foundry Coke Reduced—Pig Iron Market Quiet—Good Orders for Sheets and Tin Plate

St. Louis, July 10.—The beginning of the third quarter found the pig iron market quiet. Most melters in the district have bought only sparingly, and there is much iron to be bought for the next three months. Sales of the St. Louis Gas & Coke Corporation for the last week totaled 3300 tons, the largest order of which was 750 tons to an Illinois equipment manufacturer. Another Illinois melter took 600 tons, a local job foundry bought 500 tons; a local stove foundry took 600 tons, and 250 tons went to a Kansas City melter. The Independence Day holiday was, of course, a check to business. June shipments of the Granite City maker were about the same as in May.

Prices per gross ton at St. Louis:
No. 2 fdy., sil. 1.75 to 2.25, f.o.b.
Granite City, Ill. \$19.00
N'th'n No. 2 fdy., deliv'd St. Louis. 20.16
Southern No. 2 fdy., deliv'd. 19.92
Northern malleable, deliv'd. 20.16
Northern basic, deliv'd. 20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—The local by-product interest reduced its price on foundry coke \$1 a ton to \$8 f.o.b., ovens, for shipment out of town and 75c. a ton to \$9, delivered St. Louis. There is very little buying of foundry or domestic grades.

Finished Iron and Steel.—Because of the holiday, mills did not operate last week, except the Granite City plate mill. The Granite City company is, however, receiving orders in sufficient volume for running all of its sheet and tin mills. Tin plate specifications are quite satisfactory and that department will continue to run virtually 100 per cent. Incoming business and backlog tonnage of plates warrants 100 per cent production and next week the company will operate the galvanizing department 75 to 80 per cent of capacity. New prices of plates, shapes and bars for third quarter have brought forth a satisfactory volume of business and second-quarter specifications against

contracts have been gratifying to mills. The Texas & Pacific Railroad is in the market for 1000 kegs of track spikes for September and October delivery. The Terminal Railway Association bought 1200 kegs of track spikes.

Old Material.—The market for old material is very quiet. Consumers in the district have bought very little in several weeks, and given no indication that they will be in the market during July. Dealers have about covered on contracts, and they are merely marking time. No. 1 busheling, cast-iron borings, machine shop turnings, and No. 1 railroad wrought are 25c. lower. Railroad lists include: New York Central, 14,000 tons; Pennsylvania Lines, 49,885 tons; Baltimore & Ohio, 11,720 tons; Santa

Fe lines, 6195 tons; Wabash, 2730 tons; Missouri-Kansas-Texas, 1300 tons; Frisco Lines, 1000 tons; Ann Arbor, 670 tons; Great Northern, 67 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:
Heavy melting steel. \$10.75 to \$11.25
No. 1 locomotive tires. 12.00 to 12.50
Heavy shoveling steel. 10.75 to 11.25
Miscell. stand.-sec. rails, includ'g frogs, sw'ches and guards, cut apart. 12.25 to 12.75
Railroad springs. 13.25 to 13.75
Bundled sheets. 8.50 to 9.00
No. 2 railroad wrought. 11.00 to 11.50
No. 1 busheling. 9.25 to 9.75
Cast iron borings. 8.50 to 9.00
Iron rails. 13.00 to 13.50
Rails for rolling. 13.00 to 13.50
Machine shop turnings. 6.25 to 6.75
Steel car axles. 17.25 to 17.75
Iron car axles. 25.50 to 26.00
Wrot. iron bars and trans. 18.50 to 19.00
No. 1 railroad wrought. 9.50 to 10.00
Steel rails, less than 3 ft. 15.00 to 15.50
Steel angle bars. 11.50 to 12.00
Cast iron carwheels. 13.00 to 13.50
No. 1 machinery cast. 13.00 to 13.50
Railroad malleable. 11.25 to 11.75
No. 1 railroad cast. 13.00 to 13.50
Stove plate. 11.00 to 11.50
Agricuilt. malleable. 12.00 to 12.50
Relay. rails, 60 lb. and under. 20.50 to 23.50
Relay. rails, 70 lb. and over. 26.50 to 29.00

Birmingham

Improved Inquiries for Pig Iron—Steel Sales Continue Steady—Cast Pipe Advanced

BIRMINGHAM, July 10.—Pig iron sales last week were somewhat lighter than for the previous week. Quiet negotiations have brought about a fairly steady volume of sales since the price reduction on June 20, and a considerable portion of third quarter iron is under contract. Present inquiries indicate improved sales for the next few days. Shipments improved slightly during the past week. For foreign ports, 840 net tons of basic iron was shipped by river during the latter part of the week. The Alabama City furnace of the Gulf States Steel Co. has been blown out for rebuilding along improved lines. The No. 2 furnace of the Republic Iron & Steel Co. was blown out on June 30 for relining. The new No. 5 Fairfield furnace of the Tennessee company, blown in on June 25, was changed from foundry to basic on June 28. Eighteen furnaces are now in blast. Of this number nine are on foundry, six on basic, one on recarburizing iron and one on ferromanganese.

Prices per gross ton f.o.b. Birmingham dist. furnaces:
No. 2 fdy., 1.75 to 2.25 sil. \$15.50
No. 1 fdy., 2.25 to 2.75 sil. 16.00
Basic. \$15.00 to 16.00

Cast Iron Pipe.—Some improvement was noted last week, though all new business is still confined to small orders, coming largely from private consumers. Several good tonnages are known to be in prospect and will probably be up for figures within 30 to 60 days. Effective the first of this week, another increase of \$1 a ton was made. Quotations are now \$34 to \$35 on 6 in. and larger sizes. Shipments are active.

Coke.—Both sales and demand are unusually light. Second-half business is largely under contract and present activity is confined to a few spot sales in small lots. Specifications against contracts are improving. Prices are unchanged from the \$5 base.

Old Material.—The market is still in the dull period which has extended over the past several weeks. Only a few scattered sales are being made. A slightly better feeling is beginning to develop and dealers believe that the bottom has been reached. Prices have been the same for some time.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:
Heavy melting steel. \$8.50 to \$9.00
Scrap steel rails. 11.00 to 11.50
Short shoveling turnings. 7.50 to 8.00
Cast iron borings. 8.00
Stove plate. 13.50
Steel axles. 19.00 to 20.00
Iron axles. 20.00 to 21.00
No. 1 railroad wrought. 10.00 to 10.50
Rails for rolling. 13.00
No. 1 cast. 14.25
Tramcar wheels. 12.50 to 13.50
Cast iron carwheels. 12.00 to 13.00
Cast iron borings, chem. 13.50 to 14.00

Finished Steel.—New business continues to develop at a fairly satisfactory and steady rate. Weekly sales are running close to the average of the past month. Demand for the more important lines appears well sustained and the outlook for the first part of the quarter is favorable. The sheet market is expected to show improvement following the reduction of \$1 to \$2 a ton made last week. Other prices remain the same. The Ingalls Iron Works has orders for 225 tons of structural steel for a fruit packing plant at Tampa, Fla., and 150 tons

for an airplane hangar at Miami. The Connors Steel Co. will furnish 300 tons of reinforcing steel for a power house at Mount Holly, N. C., for the Duke Power Co. The Tennessee com-

pany is operating seven open-hearth furnaces at Ensley and five at Fairfield. The Gulf States Steel Co. has reduced its operations at Alabama City from four to three.

further sales of electric steel melting scrap at \$13, delivered Seattle. Other grades are very quiet. We continue to quote electric steel melting scrap at \$13 per gross ton, selected heavy melting steel scrap at \$11 per gross ton, and No. 1 cast iron scrap at about \$12 per net ton, all these prices being for Seattle delivery.

Pacific Northwest

Large Building Prospects—Shading in Plate Prices— Nothing New in Steel Rate War

SEATTLE, July 7 (*By Air Mail*).—There have been no new developments lately in the threatened rate war between rail and water lines serving the Pacific Coast, due to the action of the Illinois Central and the Redwood Lines in putting in a rate of 61c. on articles of iron and steel from points in Illinois and Indiana to California. Other rail and water lines serving California points have not yet met this rate. Some conferences have been held between rail and water lines interested, but no definite action has resulted.

Local conditions in iron and steel are fairly active, but there is a tendency toward lower prices, plates having settled down to 2.25c., with reports that 2.20c. has been done. Jobbers say that June tonnage was only slightly under May, but the outlook is that July may show a larger drop.

New building conditions in Seattle are active, permits issued in June amounting to \$6,223,355, the largest in any one month in the history of the city. For the first half of 1928, total permits issued amounted to \$23,389,825, the largest in any half year period on record.

Pig Iron.—Sales are few and only for very small lots, prices being unchanged. We continue to quote No. 2 foundry and Utah basic at \$25 to \$26 gross tons, delivered Seattle.

Plates.—The only large work in sight is a new water line to serve the North End, which, if it goes through, will take several thousand tons of steel pipe. We quote tank plates at 2.25c., but one local interest, representing an Eastern mill, is naming 2.20c. on any desirable orders, c.i.f. Seattle.

Shapes.—New demand and inquiry is quieting down, and no large jobs are in sight. The Star Iron & Steel Co., Tacoma, has taken 400 tons for an addition to a salt and chemical plant at Tacoma. The Kettle Falls bridge at Kettle Falls, Wash., has been placed with an Eastern interest. Prices on shapes remain firm at 2.35c., c.i.f. Seattle.

Bars.—Demand for reinforcing steel is fairly active. The Northwest Rolling Mills, Inc., has taken 350 tons for the Benjamin Franklin apartments, while this company and the Pacific Coast Steel Co. have divided about 400 tons for a new warehouse for Frederick & Nelson. We quote reinforcing bars at 2.20c. in carload lots, and up to 3c. in small lots. Mild steel bars are firm at 2.35c., but demand is quiet.

Car Wheels.—The city of Seattle is to open bids on July 13 for 550 car wheels for the Seattle Municipal Street Railway.

Sheets.—Demand is quiet, and there is some unevenness in prices, some of the smaller Eastern mills apparently seeking orders. We quote galvanized

sheets, No. 24 gage, at 4.15c. to 4.25c., No. 24 black at 3.25c. to 3.35c., and No. 10 blue annealed at 2.62c. to 2.72c., all c.i.f. Seattle.

Old Material.—There have been

Warehouse Business.—Local jobbers report that June business was heavier than looked for, but it is expected that July will show some falling off. There have been no important changes in local jobbers' prices for some months.

Warehouse Prices, f.o.b. Seattle	
	Base per Lb.
Plates and structural shapes.....	3.00c.

Buffalo

Pig Iron Inquiry Improves but Buying Is Slow—Steel Buying Fairly Good After Holiday

BUFFALO, July 10.—There is a little more inquiry for pig iron this week, but buying is lagging. The Crane Co. is taking prices on 2000 tons of iron. Two other lots of 1000 to 2000 tons, which came out for bids last week, await placement. Small-lot business has been improving. Buffalo district prices are firm at \$17 for No. 2 plain foundry and \$17.50 for malleable, but these prices are shaded for delivery outside this immediate district.

Prices per gross ton, f.o.b. furnace:	
No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50
Malleable, sil. up to 2.25.....	17.50
Basic.....	\$16.50 to 17.00
Lake Superior charcoal....	27.28

Finished Steel.—Steel buying was renewed promptly after July 4, in some lines especially. Sheets show a revival after a brief dull period. Black sheet orders have been taken at 2.70c. Reinforcing bar sales are large, with prospect of capacity mill operation this month. Wire deliveries are fairly good. There is some large structural business to be placed here soon, including 6000 tons for the new Rand Building. Warehouse sales the early part of this month were an improvement over those of early May and June. Bars are at 1.95c., Buffalo base, under competition with reinforcing bars and shapes similarly priced.

Old Material.—Deliveries of heavy melting steel are being restricted closely here, with dealers cutting down their purchases to prevent yard accumulation. No. 1 heavy melting steel is nominally unchanged at \$14 to \$14.25, although some buyers have indicated willingness to make purchases at \$13.50 for future delivery. Little scrap of any kind is moving. Buffalo dealers are not anxious to get railroad material offered this week, and little of this tonnage is expected to come here. The Bethlehem Steel Co. continues to receive scrap by water, but is not accepting deliveries from local dealers.

Prices per gross ton, f.o.b. Buffalo consumers' plants:	
Basic Open-Hearth Grades

Canada

Large Structural Steel Inquiries—Lull Settles Over Pig Iron and Scrap Markets

TORONTO, ONT., July 9.—Interest in the Canadian pig iron market has slumped. The lull is attributed mainly to the beginning of the summer holiday season and the fact that July 2 was a general holiday in Canada. Advance buying of foundry and malleable iron has practically ceased, although a small number of melters are still expected to come forward with contracts to take care of needs up to the end of September. Current demand is for small tonnages for spot delivery, but even this business was off during the past few days. Local blast furnace representatives, however, believe that a strong spot demand will reappear shortly. Pig iron consumers are enjoying one of the best seasons since 1920, with present operations averaging about 75 per cent. Spot buyers are carrying limited stocks, and many will be forced into the market within the next couple of weeks to secure supplies for current needs. No change has been announced in pig iron prices either in the Toronto or Montreal markets.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.	\$23.10 to \$23.60

Basic	23.50 to 24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Dealers' buying prices:

Structural Steel.—Demand for structural steel and reinforcing bars continues to improve. Each week

brings forth a steady flow of new orders, but despite this there is little or no decline in the prospective business in sight. Approximately 8000 tons of structural steel will be required for a new customs house to be erected in Toronto by the Dominion Government, for which tenders are expected to be called about Aug. 1. Fully 3000 tons of structural steel will be required for a proposed new Federal Government building at Ottawa, Ont., for which plans are now being prepared by the architectural department of the Department of Public Works.

Old Material.—A state of stagnation settled on the market during the week and both Toronto and Montreal dealers reported very little business. Some inquiries are appearing, however, and selling interests look for an early revival of business. Prices are unchanged.

Per Gross Ton

	Toronto	Montreal
Heavy melting steel....	\$9.00	\$7.00
Rails, scrap	10.00	9.00
No. 1 wrought.....	9.00	11.00

Stove plate	9.00	
Standard carwheels	13.00	
Malleable scrap	13.00	

for an apartment on Pacific Street, San Francisco. Los Angeles is calling for bids on 589 tons of reinforcing bars for Big Dalton Dam. Bids are being taken on 200 tons for a school in San Francisco.

Sales and inquiries for pig iron and coke are limited to small lots.

Detroit Scrap Prices Unchanged

DETROIT, July 10.—There have been no changes in prices on scrap in this district during the past week. Current orders are sufficient to cover the material being released.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$11.00 to \$11.50
Borings and short turnings	7.00 to 7.50
Long turnings	5.75 to 6.25
No. 1 machinery cast....	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets....	9.75 to 10.25
Stove plate	11.00 to 12.00
No. 1 busheling.....	8.50 to 9.00
Sheet clippings	6.00 to 6.50
Flashings	9.00 to 9.50

Lebanon-Scranton Merger Virtually Assured

Announcement is expected soon of the merger of the Lebanon Iron Co., Lebanon, Pa., and the Scranton Bolt & Nut Co., Scranton, Pa., both makers of bar iron, bolts, nuts, spikes, etc. A new financial structure will be worked out and a public offering of securities will probably be made soon through Philadelphia bankers.

Charles Hart, president Delaware River Steel Co., Chester, Pa., who is representing the interests of the late William C. Sproul in the management of the Lebanon Iron Co., is active in the formation of the merger. The plan contemplates the use of the Lebanon plant for making bars and the concentration of bolt, nut and rivet manufacturing at Scranton.

San Francisco

Steel Demand Slightly Improved with Greatest Activity in Structural Shapes and Reinforcing Bars

SAN FRANCISCO, July 12.—Demand for steel products is slightly improved, with structural shapes and reinforcing steel bars the most active. Little or no change is noted in the price structure.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00
**German fdy., sil. 2.75 to 3.25	24.25

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Awards include 275 tons shapes for A. M. Castle Co. warehouse, San Francisco, to Pacific Coast Engineering Co. and 175 tons for City Hall at Phoenix, Ariz., to Minneapolis Steel & Machinery Co. The Pacific Coast Steel Co. took 700 tons of reinforcing bars for the Lovejoy viaduct at Portland and 250 tons for the James Madison School at Seattle.

Burbank, Cal., placed 500 tons of cast iron pipe with the Grinnell Co., Pacific States Cast Iron Pipe Co. and American Cast Iron Pipe Co. Los Angeles opened bids on 2121 tons of 8 and 12-in. class 350 pipe.

Pending business includes 455 tons of shapes for a bridge at Saugus, Cal., 570 tons for the Bardsdale bridge at Ventura, Cal., and 600 tons

Work on a \$1,000,000 addition to the pressed steel division of the Motor Wheel Corporation, Lansing, Mich., will be begun at once and is expected to be completed Sept. 1. The new building will be 74 x 500 ft. and will parallel the present main building of the steel-working unit of the plant. The Motor Wheel Corporation, which now employs 2250 men in Lansing, reports sales for the first six months of 1928 to be 25 per cent greater than for the same period in 1927 and far greater than in any other six months' period in the history of the company.

Gisholt Machine Co., Madison, Wis., entertained the Chicago Superintendents' and Foremen's Club on Saturday, June 23. The Chicago group, numbering about 250, went to Madison on a special train and after an inspection of the Gisholt plant was taken on a bus tour through the city.

Non-Ferrous Metal Markets

All the Markets Quiet— Tin Sales Fairly Large— Prices Firm Except Lead, Which Is Lower

Copper.—Decided quietness pervades the entire market and sales to both foreign and domestic consumers have been of small proportions. Prices, however, continue exceedingly firm at 14.75c., delivered in the Connecticut Valley, for electrolytic copper and at 15c. c.i.f. European ports, for Copper Exporters, Inc. Such buying as there is is mostly for July, but it is admitted that both foreign and domestic consumers must still buy considerable metal for August delivery. Lake cop-

*Refinery quotation; delivered price 1/4 c. higher.

per is quoted at 14.75c. to 14.87 1/2c., delivered, in a quiet market.

Tin.—Considering the Fourth of July holiday, sales of 1000 tons for the week ended July 7 are considered fairly large. Yesterday, Monday, about 150 tons changed hands among dealers, but the interesting feature is that interest centers in August delivery and that futures are neglected. Previously demand has been for spot, July and August. This is pointed to as indicating that consumers have evidently let their supplies shrink. Otherwise the market has been exceedingly uninteresting. Today, Tuesday, spot Straits tin is quoted at 46.25c., New York, with demand very light. Quotations in London today

were lower than a week ago, with spot standard quoted at £209 2s. 6d., future standard at £206 12s. 6d. and spot Straits at £212 2s. 6d. The Singapore price today is £209 5s. Arrivals thus far this month have been 2485 tons, with 5485 tons reported afloat.

Lead.—Owing to lower prices in London and the possibility of importations, the American Smelting & Refining Co., late yesterday, Monday, reduced its quotation from 6.30c. to 6.20c., New York, as the regular contract price. Values naturally sagged in the outside market and today the metal is quoted at 6.10c. to 6.12 1/2c., St. Louis. A moderate business is reported, with activity a little more

pronounced in the West than in the East.

Zinc.—Consumer demand is reported to be fairly good each day and prices are exceedingly firm at 6.20c., East St. Louis, or 6.55c., New York, for prime Western zinc. A hand-to-mouth buying policy continues and producers are in no mood to force the market. Statistics for June showed a decrease in stocks of refined metal of about 750 tons, with production and shipments about balancing one another. Ore prices at Joplin are unchanged at \$40 per ton and production is very light, only about 3500 tons, owing to the holiday, with sales between 9500 and 10,000 tons. The statistical position of the market is decidedly favorable.

Nickel.—Ingot nickel in wholesale lots is quoted unchanged at 35c., with shot nickel at 36c. and electrolytic nickel at 37c. per lb.

Antimony.—The market is a little firmer with Chinese metal for spot delivery unobtainable at less than 9.62½c., and with futures at 9.75c., New York, duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 10.—Sales are few in number and of moderate size. Copper and antimony are advanced and tin is lower in price. The old metal market is steady.

Prices, per lb., in carload lots: Lake copper, 14.87½c.; tin, 47.50c.; lead, 6.25c.; zinc, 6.30c.; in less-than-carload lots, antimony, 11.25c. On old

metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.;

zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

RAILROAD EQUIPMENT

THE Argentine State Railways have placed orders with United States makers for 1100 miscellaneous freight cars. Twenty electric locomotives have been placed by the Cleveland Union Terminals Co. Outstanding among the week's inquiries is one for 300 passenger train refrigerator cars from the Pennsylvania. Details of the week's business follow:

Chesapeake & Ohio will build 10 locomotive tenders in its own shops.

Chicago, West Pullman & Southern has ordered one six-wheel switching locomotive from Baldwin Locomotive Works.

Cleveland Union Terminals Co. has ordered 20 electric locomotives from General Electric Co.

Mexican Railway Co. has ordered two Pacific type locomotives from American Locomotive Co.

Missouri-Kansas-Texas has ordered 19 baggage and mail cars from American Car & Foundry Co.

Pennsylvania Railroad has revived its inquiry for 300 passenger train refrigerator cars.

Illinois Central is inquiring for 13 locomotive tenders.

Fruit Growers' Express has made inquiry for 150 steel underframes for refrigerator cars.

Jacob Dold Packing Co. is inquiring for 10 steel underframes for 30-ton refrigerator cars.

Argentine State Railways have placed orders for 1100 miscellaneous freight cars, the business having been divided between

Middletown Car Co. and American Car & Foundry Co.

Alaska Railroad will buy one 2-8-2 type locomotive.

Delaware & Hudson will buy one 2-10-0 type high-pressure experimental engine.

Chicago, St. Paul, Minneapolis & Omaha

An item was published on page 1405 of THE IRON AGE for May 17 to the effect that the Spanish Government had ordered textile machinery older than 40 years to be destroyed and had provided for partial compensation for the destruction of machinery purchased during that time. A reply from Madrid is this: "Although project has been discussed as much as two years ago, government officials inform us no action has been taken and no indications of any early intention to carry out project."

A company known as the Isothermos Corporation of America, 11 West Forty-second Street, New York, has been formed to manufacture, to American standards, the "Isothermos" journal box for use on railroad cars. This form of journal box is said to have become standard equipment on some European railroads and to be used also in Africa and in South America. Fitted with an automatic lubrication system, it is claimed that it will run for 100,000 miles without further attention or refilling.

Low-Built Crawler Crane for Rapid Handling of Bulk Materials

LOW center of gravity, speed, simplicity of operation, ruggedness and absence of friction clutches are features of a new crawler crane made by H. D. Conkey & Co., Mendoça, Ill. The crane is designed for either gasoline or electric drive. It is self-contained, swings through the full circle and runs on an endless tread traction. It is primarily a rapid material-handling unit for grab bucket, dragline bucket and hook-block work.

One man operates all functions—hoisting, raising and lowering boom, swinging, traveling and steering—from the operator's deck near the front of the cab. The traveling gear is arranged for two speeds under control of the operator, regardless of the position of the turntable. The swing brake is of such design that the turntable or machinery deck may be set in any position with relation to the car body.

A special feature is the method of engaging the hoisting and holding drums. A heavy ball thrust bearing in connection with a special thrust nut provides an efficient means of op-

eration and eliminates all thrust screws, washers, springs and cams. This feature brings about smoothness

of operation with increased working capacity. The new crawlers are being built in ½, ¾ and 1-cu. yd. capacities.

Fabricated Structural Steel

Ohio River Bridge Takes 14,000 Tons of 42,600 Tons Awarded—Office Building Calls for 12,000 Tons

INCLUDING 14,000 tons for a bridge across the Ohio River at Louisville, Ky., fabricated structural bookings in the last week amounted to 42,600 tons. New projects totaled 20,900 tons, the largest being a building in New York, which will require 12,000 tons. Awards follow:

HARTFORD, VT., 200 tons, State bridge, to American Bridge Co.
FITCHBURG, MASS., 175 tons, theater, to New England Structural Co.
BOSTON & MAINE RAILROAD, 200 tons, bridge at Somerville, Mass., to American Bridge Co.
MECHANICVILLE, N. Y., 1200 tons, pulp and paper mill, to Palmer Steel Co.
NEW YORK, 3500 tons in the following jobs as reported to the Structural Steel Board of Trade: Apartment building at Riverside Drive and 104th Street and 110 West Eighty-sixth Street, Madison House at Madison and Jefferson Streets, court house at Amsterdam Avenue and 151st Street and public school 148, Jackson Heights, to Harris Structural Steel Co.
NEW YORK, 3500 tons, extension to Fourteenth Street office building, to McClintic-Marshall Co.
NEW YORK, 600 tons, stockyard building on West Forty-first Street for New York Central Railroad, to McClintic-Marshall Co.
STATE OF NEW JERSEY, 400 tons, highway bridge, to American Bridge Co.
LEHIGH VALLEY RAILROAD, 800 tons, bridge, to American Bridge Co.
DELAWARE, LACKAWANNA & WESTERN RAILROAD, 250 tons, bridge, to Phoenix Bridge Co.
PENNSYLVANIA RAILROAD, 600 tons, transmission towers, to Shoemaker Bridge Co.
PENNSYLVANIA RAILROAD, 250 tons, bridges, to Bethlehem Steel Co.
PHILADELPHIA, 1700 tons, garage, to McClintic-Marshall Co.
PHILADELPHIA, 2200 tons, garage and office building at 1608 Walnut Street, to McClintic-Marshall Co.
ATLANTIC CITY, N. J., 600 tons, power house for Haddon Hall-Chalfonte Hotel, to Bethlehem Steel Co.; to be electrically welded.
PLYMOUTH, PA., 1800 tons, coal breaker for Lehigh & Wilkes-Barre Coal Co., to Fort Pitt Bridge Co.
TAMPA, FLA., 225 tons, fruit packing plant, to Ingalls Iron Works Co.
ORLANDO, FLA., 150 tons, airplane hangar, to Ingalls Iron Works Co.
LOUISVILLE, KY., 14,000 tons, bridge over Ohio River between Louisville and Jeffersonville, Ind., to American Bridge Co.
NEWARK, OHIO, 180 tons, telephone building, to Pittsburgh-Des Moines Steel Co.
CLEVELAND, 500 tons, Randolph exchange building for Ohio Bell Telephone Co., to H. Brooks Co.
CINCINNATI, 130 tons, Christ Hospital, to McClintic-Marshall Co.
TOLEDO, 500 tons, plant for Libbey-Owens Glass Co., to Bellefontaine Bridge Works.
KENMORE, OHIO, 140 tons, Twenty-seventh Street viaduct, to Burger Iron Works.
MICHIGAN CENTRAL RAILROAD, 300 tons, bridge work, to McClintic-Marshall Co.
SAGINAW, MICH., 2600 tons, foundry for Chevrolet Motor Co., to American Bridge Co.

BUFFALO, 2500 tons, Rand Building; from John W. Cowper Co., contractor, to Bethlehem Steel Co.
CHICAGO, 750 tons, building for Miehle Printing Press Co., to Illinois Steel Co.
CHICAGO, 900 tons, building for International Harvester Co., to Gage Structural Steel Co., local.
CHICAGO, 345 tons, Kresge store building, to Wendnagel & Co., local.
CHICAGO, 250 tons, building for Produce Terminal & Cold Storage Co., to Gage Structural Steel Co.
CHICAGO, 165 tons, building for Commonwealth Edison Co., to Hansell-Elcock Co., local.
WILMETTE, ILL., 150 tons, water tank, to Chicago Bridge & Iron Co.
EAST ST. LOUIS, 935 tons, foundry, to McClintic-Marshall Co.
TACOMA, WASH., 400 tons, addition to salt and chemical plant, to Star Iron & Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

SPRINGFIELD, MASS., 100 tons, city bridge.
NEW YORK, 12,000 tons, Western Union Building in West Broadway.

REINFORCING STEEL

AWARDS reported during the last week included no jobs of outstanding size and amounted only to 3000 tons. Among the new projects totaling 4750 tons are two warehouses in New York and Chicago, requiring 1200 tons each, and a municipal reservoir at Portsmouth, Ohio, which will take 1000 tons. Awards follow:

WHITE PLAINS, N. Y., 150 tons, garage, to Concrete Steel Co.
NEW YORK, 110 tons, loft building at John, Cliff and Pearl Streets, to Carroll-McCreary Co., Inc.
LONG ISLAND CITY, N. Y., 275 tons, post office, to Kalman Steel Co.
STATE OF NEW JERSEY, 100 tons, road work, to Concrete Steel Co.
MOUNT HOLLY, N. C., 300 tons, power plant for Duke Power Co., to Connors Steel Co., Birmingham.
CLEVELAND, TENN., 100 tons, school, to Connors Steel Co.
CHICAGO, 200 tons of rail and billet steel bars, apartment building at Fifty-first Street and Kenwood Avenue, to Concrete Engineering Co.
CHICAGO, 185 tons, Sayre Public School, to Concrete Steel Co.
CHICAGO, 285 tons, Chicago Women's Club, to Concrete Steel Co.; previously reported to unnamed bidder.
CHICAGO, 400 tons, Glen Holmes garage, to an unnamed bidder.
CHICAGO, 220 tons, Austin High School, to an unnamed bidder.
MAYWOOD, ILL., 210 tons, for Public Service Co. of Northern Illinois, to an unnamed bidder.
SEATTLE, 350 tons, Benjamin Franklin apartments, to Northwest Steel Rolling Mills.
SEATTLE, 400 tons, warehouse for Frederick & Nelson; divided between North-

NEW YORK, 2000 tons, Sloan Memorial Y. M. C. A., Ninth Avenue and Thirty-fourth Street.
NEW CITY, N. Y., 300 tons, Rockland County Court House.
PHILADELPHIA, 600 tons, Girard Avenue Bridge.
PHILADELPHIA, 250 tons, morgue.
PHILADELPHIA, 875 tons, bridge for city of Philadelphia at Sixth Street and Allegheny Avenue; bids close July 11.
PENHURST, PA., 300 tons, normal school.
PENNSYLVANIA RAILROAD, 600 tons, electric transmission work; Shoemaker Bridge Co., low bidder.
READING RAILROAD, 300 tons, grade elimination work at Bridgeport, Pa.
TRENTON, N. J., 300 tons, State highway bridge; bids close July 23.
BURLINGTON COUNTY, N. J., 300 tons, Wading River bridge.
ATLANTA, GA., 800 tons, Mitchell Street viaduct.
SPRINGFIELD, ILL., tonnage not stated, highway bridges.
CHICAGO, 600 tons, two public schools.
CHICAGO, 150 tons, office building at Sixty-third Street and Maryland Avenue.
HIGHLAND PARK, ILL., 200 tons, elevated water tank.
MENASHA, WIS., 300 tons, Tayco Street bridge; general contract let to Greiling Engineering Co., Green Bay, Wis.
MILWAUKEE, 125 tons, municipal fire department repair shop; Milwaukee Structural Steel Co., low bidder.
OMAHA, NEB., 600 tons, Joslyn memorial building.

west Steel Rolling Mills and Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 1200 tons, terminal warehouse for Lehigh Valley Railroad at 144th Street and Girard Avenue; Barney-Ahlers Construction Corporation, general contractor.
RAVENA, N. Y., 350 tons, work for city water department.
PORTSMOUTH, OHIO, 1000 tons, municipal reservoir.
CHICAGO, 1200 tons, building for Produce Terminal & Cold Storage Co.
CHICAGO, 500 tons, two public schools.
ST. LOUIS, 500 tons; hotel at Eighth and Market Streets, 300 tons; fruit house for Wabash Railway, 200 tons.

German Steam Boiler Business Poor

The business situation in the German steam boiler and apparatus industry, according to United States Trade Commissioner James E. Wallis, Jr., Berlin, was not generally prosperous during the first quarter of 1928. Boiler tube manufacturers report a decrease in orders both from at home and abroad, amounting to about 20 per cent, as compared with last year's average. The steam boiler apparatus makers appear to have been hit hardest, as the orders received during the first quarter of 1928 amount to only 50 per cent of those secured during the last quarter of 1927.

Exports of boiler apparatus have shown no improvement and there seems to be no indication of any immediate improvement as a whole.

PERSONAL

F. E. VIGOR has been appointed assistant works manager of the Ashland, Ky., division of the American Rolling Mill Co. For a number of years he has been assistant traffic manager, located at Middletown, Ohio.

F. E. VIGOR

D. S. MAIR, for 17 years manager of the Houston, Tex., office of Joseph T. Ryerson & Son, Inc., Chicago, has gone into business for himself under the name of the D. S. Mair Machinery Co., with offices at 505 Esperson Building, Houston. He will handle the complete line of bolt and pipe threading machines and Victor taps of the Landis Machine Co., Waynesboro, Pa., and the machine tool line of the Ryerson company.

EDWIN R. WEGENER has been appointed general manager of the Detroit Forging Co., Detroit, maker of drop forgings. For the last 16 years he has been identified with the steel and forging division of the Ford Motor Co.

JULIUS F. STONE has been named president; Julius F. Stone, Jr., vice-president; J. C. Dunn, vice-president and treasurer, and Frederick Mitchell, secretary, of the Chisholm-Moore Hoist Corporation, Cleveland, which was formed recently following the purchase of the Chisholm-Moore Mfg. Co. by the Columbus McKinnon Chain Co., Tonawanda, N. Y. These men and A. L. McKinnon will constitute the new corporation's board of directors, and John R. Mears will continue as sales manager.

FRANK C. NICHOLS, vice-president of the Colt's Patent Fire Arms Mfg. Co., Hartford, Conn., has sailed for England on a business trip.

CHARLES M. POND, manager of the small tool and gage department of

the Pratt & Whitney Mfg. Co., Hartford, Conn., last week completed 25 years' service with the company.

H. W. FERNALD has severed his connection with the Boston office of Rogers, Brown & Crocker Brothers, Inc., and with Mrs. Fernald has started for the Pacific Coast for a 60-day trip. They will return via the Panama Canal. Donald R. Simonds has resigned as sales representative of the Eastern Malleable Iron Co., to succeed Mr. Fernald. Mr. Simonds formerly was associated with Read, Fears & Miller, Inc., and other Boston pig iron firms.

CARL F. WEIBLEN, formerly manager at Cleveland for the G. H. Williams Co., and previously a member of the home office organization at Erie, Pa., has been appointed Chicago manager. He replaces R. B. Randall, who is to be Pacific Coast manager for the Link-Belt Co., with headquarters at San Francisco.

CARL R. ENGLISH, formerly storekeeper and purchasing agent for the Todd Dry Docks, Inc., Seattle, has been appointed purchasing agent for the Pacific Coast Cement Co., Pacific Coast Coal Co., Pacific Coast Engineering Co., and Pacific Coast Steamship Co., all affiliated interests, with headquarters at Seattle.

JOHN C. WILLIAMS, vice-president and general manager Weirton Steel Co., Weirton, W. Va., accompanied by Mrs. Williams, will sail for Europe on the Berengaria, July 16.

JOHN L. COLLINS, who has been in charge of the coal and coke division, Pittsburgh office, M. A. Hanna Co., has been transferred to the company's general offices in Cleveland. He has been succeeded at Pittsburgh by Charles R. Keenan.

F. W. SAMPSON has been appointed engineer in charge of the shock absorber division of the Continental Motors Corporation, Detroit. He has been a member of the company's engineering staff for four years.

A. W. LEWIS has been appointed acting resident manager in charge of the Cleveland works and sales office of the United States Cast Iron Pipe & Foundry Co., Burlington, N. J.

IRA J. OWEN has established himself as a consulting mechanical engineer, specializing in industrial surveys, to stress the engineering viewpoint in place of relying upon the balance sheet. He has offices at 400 First National Bank Building, Chi-

cago. He is a graduate in mechanical engineering from Cornell University and is a member of the American Society of Mechanical Engineers and of the Western Society of Engineers.

JOHN S. LATTI, for many years manager of the Philadelphia branch of the Manhattan Rubber Mfg. Co., Passaic, N. J., has resigned and has been succeeded by David Newhall. Headquarters remain at 2132 Market Street.

MURRAY J. LAIRD has been made president of the Carpenter-Tew Gear Co., Inc., Brooklyn, succeeding W. H. Tew, who has resigned following a reorganization of the company. M. V. Tighe is now vice-president of the company, and J. L. Hannigan, secretary and treasurer.

C. S. PROUDFOOT, general manager Vanadium Corporation of America, Niagara Falls, N. Y., whose election as president of the Association of Iron and Steel Electrical Engineers was announced in THE IRON AGE last

C. S. PROUDFOOT

week, was one of the pioneers in steel mill electrification 35 years ago. He was largely responsible for the blast furnace bell-operated rig which later helped him in a large degree to make possible the automatic blast furnace now in operation at the Bethlehem Steel Co. plant at Johnstown, Pa. He was associated with A. C. Dinkey at Homestead, in the early nineties and with A. A. Corey at Johnstown in 1918 as electrical engineer of the Bethlehem Steel Co., from which position he resigned to become general manager of the Vanadium corporation. Mr. Proudfoot has been an active member of the Association of Iron and Steel Electrical Engineers for the past 20 years.

W. ROACH, for the last 10 years identified with the American Brass Co., most recently as manager of the sales promotion department at its Buffalo branch, has been appointed assistant sales manager of the mill products division, Mueller Brass Co.,

Port Huron, Mich. Before going with the American company, he was employed in the manufacturing departments of Dodge Brothers, Inc., Detroit.

JOHN S. SAMMONS, for the last two and a half years sales manager of the Beardsley & Piper Co., Chicago, has been appointed general manager of the American Foundry Equipment Co., Mishawaka, Ind. He was born at London, Ont., in 1890, and after attending grammar school at Rockford, Ill., began work with the Andrews Iron & Wire Works, Rockford. In recent years he has served several companies in sales and executive capacities.

E. R. ANDERSON, formerly identified with the Chicago office of the Hendey Machine Co., Torrington, Conn., has joined the sales organization of the Stocker-Rumely-Wachs Co., Chicago, dealer in machine tools.

F. H. LUCAS, formerly assistant manager in the Detroit office, American Bridge Co., has been appointed contracting engineer at Chicago for the McClintic-Marshall Co.

E. J. PAULUS has been appointed manager of the Chicago district for the McClintic-Marshall Co. Mr. Paulus was engineer of construction for the company of the Detroit River bridge.

E. N. MATTSON has been appointed sales manager in the Chicago office of the American Cast Iron Pipe Co., Birmingham, succeeding D. W. Wallace, who has taken charge of the Minneapolis office of that company.

J. J. SEAVER, formerly vice-president of Arthur G. McKee & Co., Cleveland, has become associated with H. A. Brassert & Co., Chicago engineers, as vice-president.

The Interstate Commerce Commission has postponed from July 8 to July 14 the effective date of its decision in the Consolidated Southwestern cases. On June 21 the commission issued an order denying a petition of the Southwestern Pipe Consumers' Committee to reopen the case so far as it related to the new rates provided on wrought iron and steel pipe. The committee has again petitioned the commission, asking that it reconsider the order.

The Aluminum Co. of America, Pittsburgh, has commenced the manufacture of barium and zinc fluorides, which find an increasing use in the enamel, glass, tile and brick trades. Charles Hardy, Inc., of 100 East Forty-second Street, New York, has been appointed distributing agent in the United States for these products.

OBITUARY

CHARLES MACDONALD, one of the country's best known bridge engineers, president of the American Society of Civil Engineers 20 years ago, and the second president of the Engineers Club, New York, died July 8, near Gananoque, Ont., aged 91 years. In 1890 he helped organize the American Bridge Co., of which he was vice-president until it was absorbed by the United States Steel Corporation.

FREDERICK P. REINHART, treasurer Standard Screw Products Co., Detroit, died at the Ford Hospital in that city on June 29 after a brief illness. He was born in Pittsburgh 45 years ago. Before going with the Standard company 14 years ago he was associated for a time with the Hamilton Iron & Steel Works, Hamilton, Ont.

HERBERT LLOYD, chairman Electric Storage Battery Co., Philadelphia, died in that city on July 3, aged 66 years. Prior to his partial retirement on account of ill health last year, he had been president of the Storage Battery company for 20 years. Mr. Lloyd was born in Wales and came to this country in early life

to take up post-graduate work in chemistry.

GERARD T. VAN SCHAICK, president of the Universal Railway Supply Co., Chicago, was killed, July 8, in an automobile accident near his summer home on Eagle River, Wis.

SAMUEL L. AYR, automotive engineer, died at his home in Detroit on July 4. He was born in Scotland 49 years ago and was graduated from the Glasgow Technical College as a mechanical engineer. When he was about 25 years old Mr. Ayr came to America and settled in Detroit, where he entered the employ of the Packard Motor Car Co. Leaving the Packard organization he went with the Automatic Transportation Co., Buffalo, and later had been an engineer on the Detroit staff of General Motors Corporation.

E. J. REMENSNYDER, who has been assistant purchasing agent of the Pennsylvania Railroad for many years, died at the Oliver Baird Hospital, Philadelphia, June 28, aged 44 years.

Standard Pound One Century Old

By act of Congress May 19, 1828, the Troy pound was adopted as standard by the United States Mint. To quote from the act: "The brass pound weight, procured by the Ministry of the United States at London in 1827, for the use of the Mint, and now in the custody of the Mint in Philadelphia, shall be the standard Troy pound of the Mint of the United States, conformably to which the coinage thereof shall be regulated."

Although that Troy pound was officially made the standard for coinage only, it became in effect the primary standard of the United States for all purposes, according to a statement in the Monthly News Bulletin of the Department of Commerce. The avoirdupois pound was derived from it through the relation of 7000 grains making a pound avoirdupois, against 5760 of the same size grains making a Troy pound. In 1911 the Troy pound of the Mint was superseded by the Troy pound of the Bureau of Standards, but this involved no change in value.

Bituminous coal raised in the first half of the year is reported by the United States Bureau of Mines at 234,280,000 net tons. This compares with 276,410,000 tons in the first half of 1927 and, with the exception of 1925, was the lowest total in the first half of any year since 1922.

Government Steel Industry in South Africa

The South African Iron & Steel Industrial Corporation, Ltd., was created by an act recently passed by the Parliament of the Union of South Africa. The authorized capital stock is £3,500,000, of which 500,000 "A" shares of £1 each will be subscribed by the Governor-General and 3,000,000 "B" shares of £1 are to be offered for subscription by the public. The A shares are to be paid for from funds to be appropriated by Parliament. The board of directors will consist of seven members, of which four will be appointed by the Governor-General and three by private shareholders. The Governor-General will designate the chairman of the board and the managing director.

The act also provides that the Railways and Harbours Administration shall contract with the new corporation for iron and steel that it may require.

Production of electric power by public utility power plants in the United States in May is reported by the Geological Survey at 7121 millions of kwhr. This compares with 6853 in April and with 7246 in March. The May total produced by water-power was considerably larger than in April or March, having aggregated nearly 45 per cent of the total output, against 39 per cent in March and 43 per cent in April.

Dullness Features European Markets

French Costs Rise with Franc Stabilization—Belgian Back-Logs Shrink—Russian Output Higher

(By Cable)

LONDON, ENGLAND, July 9.

PIG iron continues dull and output further has been restricted by damping one Midland furnace. Cleveland makers are seeking fresh orders, but consumers are not contracting for forward needs at present prices. Hematite iron is weak on continued absence of demand and heavy stocks despite limited output.

Foreign ore is quiet. Some non-union Swedish miners returned, but there are few signs of any definite end to the strike.

Finished steel is dull in the heavy lines, but moderately active in some other departments, particularly bolts, nuts and rivets.

Export demand for heavy material

is virtually idle, Scottish works closing for the Glasgow Fair at the end of the current week. Robert Hyde of Sheffield is moving works to Stoke, as being more convenient.

Continental iron and steel also is quiet, but the price position is unaffected by Antwerp dock strike, which, it was hoped, would terminate this week.

Tin plates are quiet on the recent fall in tin. Consumers are withholding, but makers are well sold. Forward business is done at 18s. 3d. and prompt at 18s. 6d., both on the basis of IC plates, base box, f.o.b. works port.

Galvanized sheets are moderately active in small parcels. Black sheets are quiet.

It will, however, permit greater security in transactions and should tend to reduce the rate of interest.

Pig Iron.—A total of 35,000 tons of phosphoric foundry iron has been placed at the disposal of domestic foundries for July, 3000 tons less than in June. The supply of hematite iron for domestic users in July has been reduced to 35,000 tons, a decline of 5000 tons from the June figure. To offset the reports that stabilization of the franc would result in higher pig iron prices, it has been announced that the price of foundry iron will be maintained unchanged for three months, until the end of September. Should this method of establishing a price for three-month periods prove satisfactory, it may be continued in the future. The present quotation is 440 fr. (\$17.25) per ton, f.o.b. Longwy, for No. 3 foundry grade. The entente of French, Belgian and Luxemburg producers of pig iron has decided to place 30,000 tons of phosphoric iron at the disposal of Belgium during August and September, and the association will maintain its export prices, except on shipments to Italy, which will carry an increase of 1s. (24c.) per ton.

Semi-Finished Material.—An advance in semi-finished material and beams of 20 to 25 fr. (78c. to 97c.) per ton is contemplated, but the Comptoir Siderurgique has announced that no change in prices will be made for the next month. In the domestic

Costs Up with Stable Franc

More Accurate Cost Figuring Expected—New Taxes Have Awaited Stabilization

PARIS, FRANCE, June 26.—Stabilization of the franc on the basis of one-fifth of its pre-war value has brought up the question of its influence on prices. It is expected that costs will increase to some extent, as, with the franc on a gold basis, French producers will more accurately determine depreciation, in proportion to the

new valuation of their plants. There will also be the additional cost of new social legislation, such as the insurance act, which had been postponed until stabilization of the currency was completed.

The valuation of the franc, as stabilized, is at practically the same level as during the past 12 to 18 months.

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.87 per £ as follows:

	£0 17½s. to £0 18s.	\$4.27 to \$4.38
Durham coke, del'd.	1 2½	5.48
Bilbao Rubio ore	3 8½ to 3 9½	16.68 to 16.92

(a) Nominal.

market blooms are quoted at 535 fr. (\$20.97) per ton, billets at 565 fr. (\$22.15) per ton and sheet bars at 600 fr. (\$23.52) per ton, all f.o.b. Thionville.

Finished Material.—Mills are still well booked with orders and in most cases are asking three to four months to make deliveries. Business from foreign markets and the French colonies is in good volume, and mills are expecting some sizable orders for Navy construction work and from the railroads. For export, steel bars have receded from the maximum of £5 15s. to £5 16s. per ton (1.27c. to 1.28c. per

lb.), the market a fortnight ago, to about £5 13s. 6d. per ton (1.25c. per lb.). Competition for hoop orders is keen, with quotations slightly higher than on other products. Sheet prices in the export market have begun to sag, but there is still a fair domestic demand. Deliveries range from two to three months. Prices of wire rods in the domestic market are to be advanced, Aug. 1, 25 fr. (97c.) per ton for both basic, Bessemer and open-hearth grades, the new quotations being 825 fr. (\$32.34) per ton for basic and 945 fr. (\$37.04) for open-hearth rods.

Belgian Market Weaker

Pressure by Exporters Has Brought Price Decline—Deliveries Shorten

ANTWERP, BELGIUM, June 22.—Following a period of decided firmness, the steel market has begun to show weakness. Mills are apparently well booked, but buyers are beginning to doubt that unfilled tonnages of most makers are as large as was previously believed. As a result, consumers are pressing for concessions and the market has a downward trend. Exporters have contributed to weakness of prices by accepting foreign business below mill prices and then offering firm orders at lower figures. Price instability has extended to domestic business. However, foreign trade continues fair and is improving, especially with southern China. At the same time, German mills are showing less interest in export business and some are practically out of the market.

A strike of dock workers at Antwerp has been an obstacle to the normal flow of export shipments, and sellers are having considerable difficulty in making deliveries, which are long overdue.

Pig Iron.—Domestic demand continues fair and there is a small volume of export business. No. 3 phosphoric foundry iron is quoted at about 580 fr. (\$16.40) per metric ton to domestic users and continues at about £3 2s. 6d. (\$15.40) per ton, f.o.b. Antwerp, for export. French competition in Thomas grade iron is keen, and prices are slightly weaker. Bessemer hematite iron is still in competition with the British product, and the market is about \$18.45 per ton, f.o.b. furnace.

Semi-Finished Material.—Blooms are still moderately firm and available supplies are small, but mills are seeking orders for billets and the market on sheet bars is depressed, with prices weak. Blooms range from £4 6s. (\$21.10) per ton for 8-in. to £4 12s. (\$22.55) for 4-in. Billets are quoted at £4 13s. (\$22.80) per ton for 3-in. and £4 15s. (\$23.30) for 2-in. Sheet bars are about £4 16s. (\$23.50) per ton, f.o.b. Antwerp.

Finished Material.—Buyers are beginning to doubt that mills have been

as well booked as previously reported, and pressure for concessions has been partially successful. Much earlier deliveries are being offered by makers than could be obtained a fortnight or more ago. Steel bars are offered quite freely at £5 14s. to £5 15s. per ton (1.26c. to 1.27c. per lb.), and as low as £5 13s. 6d. per ton (1.25c. per lb.) is obtainable on a desirable bar specification. Other steel products show the same tendency toward weakness, except wire rods, the price of which is unchanged. Beams are quoted at £4 18s. per ton (1.08c. per lb.), and corrugated bars at £5 17s. per ton (1.29c. per lb.). Hot-rolled steel hoops are £6 15s. per ton (1.49c. per lb.), all f.o.b. Antwerp. Sheet prices show slightly less weakness than other products, and French competition is still evident, but not as a serious factor.

Decline in French Exports, Increase in Imports

Exports of iron and steel products from France during the first quarter of 1928 totaled 1,441,477 metric tons, against 1,494,596 tons during the corresponding period of last year, while imports were 44,624 tons and 34,448 tons respectively, according to report received by the Department of Commerce from the assistant commercial attaché at Paris. In exports, pig iron showed a 20 per cent decline in the first quarter of this year, to 164,545 tons from 217,562 tons during the corresponding period of last year; blooms, billets and bars decreased 5 per cent, to 726,153 tons from 762,036 tons; structural material declined 30 per cent, to 48,659 tons from 65,517 tons; rails declined 7 per cent, to 85,248 tons from 91,161 tons. Cut sheets increased almost 85 per cent, to 32,806 tons from 17,997 tons; hot-rolled hoop iron and steel increased 45 per cent, to 35,600 tons from 22,849 tons, and machine iron or steel increased 30 per cent, to 60,515 tons from 46,982 tons. Iron ore exports increased 20 per cent, to 4,159,822 tons from 3,403,028 tons. The greatest increase in imports

during the first quarter of 1928 over the corresponding period of 1927 was made in pig iron, the totals being 12,140 tons and 5419 tons respectively.

Although the total iron and steel exports during the first quarter of 1928 were slightly less than in the corresponding period of the previous year, at the beginning of 1927 there was a heavy carry-over of orders accumulated in the fall of 1926 as a result of the British coal strike, which diverted many orders to the Continent. The fact that the sales abroad in the early part of 1928 nearly approximated the abnormal conditions in the first part of 1927 is taken to indicate that the French iron and steel industry is finding demand heavier, both at home and abroad.

Germany to Produce Aluminum Sheets Next Year

HAMBURG, GERMANY, June 23.—According to latest reports, the sheet mill being constructed by the Stahlwerke Hoesch of Dortmund at Stockheide will be ready for operation about January, 1929. The new mills will produce aluminum-plated sheets under the "Feran" process, which will be offered in competition with tin plate. Thus far the Hoesch interests have refused to give licenses for the use of the process in foreign countries.

Japan Places Cable Order in Germany

HAMBURG, GERMANY, June 23.—An order for 90 miles of deep sea cable has been booked by the German cable manufacturers, Felten & Guillaume of Cologne, from the Japanese Government. Other recent orders booked by these makers have included a cable from Denmark to Sweden, one from Sweden to Germany and a large order from Italy for a Mediterranean cable.

Brazilian Imports Increase Heavily in 1927

WASHINGTON, July 10.—Imports of iron and steel products into the Brazilian port of Santos in 1927 aggregated 206,805 metric tons as against 155,103 tons in 1926, a gain of 51,702 tons, according to the Department of Commerce. The principal suppliers of this trade were Belgium, with 42 per cent of the 1927 total, compared with 43.5 per cent of the 1926 imports; the United States, with 24.3 per cent against 22.9 per cent; Great Britain, with 17.9 per cent compared with 8.9 per cent; and Germany, with 4.6 per cent against 7.1 per cent. Countries not listed supplied 10.6 per cent of the 1927 total, against 17.6 per cent of the 1926 total.

Seven classes of commodities combined in 1927 to constitute nearly 75 per cent of the total imported, rails and accessories leading with 46,956

tons, against 51,602 tons in 1926. Other leading items of importation in 1927 were black sheets and plates, 29,192 tons; cast iron pipe, 22,996 tons; bars and bar mill shapes, 22,221 tons; barbed wire and staples, 15,279 tons; steel tubes, 12,465 tons, and galvanized and other wire, 10,049 tons.

The United States supplied 51.4 per cent of the total imports of rails and accessories, Great Britain supplied 74 per cent of the imports of black sheets and plates. Belgium was credited with 82 per cent of the imports of cast iron pipe, 72 per cent of the

bars and bar mill shapes, and nearly 52 per cent of the imports of barbed wire; the United States supplied 29.3 per cent and Germany 10.7 per cent of the last-named product.

Sources of Imports of Iron and Steel Products Through Santos, Brazil, in 1926 and 1927

Country	1926 Metric Tons	1927 Metric Tons
Belgium	67,600	88,237
Germany	10,926	9,515
Great Britain ...	13,715	36,937
United States ...	35,533	50,184
All other countries	27,329	21,932
Total	155,103	206,805

Russian Steel Output Expands

Large Part of Proposed Expenditures on Industry Are in Steel Plants—Volga Bridge Planned

MOSCOW, RUSSIA, June 22.—Although the program for iron and steel production in the fiscal year 1927 to 1928 was not in all cases fulfilled, Russia's output in the first half of the year was considerably larger than in the corresponding period of the fiscal year 1926 to 1927. From last Oct. 1 to March 31 of this year pig iron output totaled 1,851,100 metric tons, compared with 1,473,450 tons in the first half of the previous business year. Steel ingot production was 2,406,200 metric tons, compared with 1,766,500 tons in the same period of the previous business year, and output of rolled products was 1,908,700 metric tons, compared with 1,343,550 tons.

The program of the Soviet Government for the business year beginning in October, 1928, and ending in October, 1929, calls for a total capital investment in metallurgical development of 490,000,000 rubles, out of a total of 1,752,000,000 rubles to be expended in all industry. The Council of Economy complains of high prices for steel and, particularly, of increased costs of railroad rolling stock. Actually, metal prices are only 71 per cent higher than before the war, according to the official price index,

while the general index is 188. Steel prices are relatively dear, however, in view of the fact that German steel prices are only about 27 per cent higher than the pre-war level.

Construction work in prospect includes shortening and straightening a new central Asian railroad, which joins the Siberian with the old central Asian railroad. It has also been decided to build a new railroad bridge across the Volga River at Kostroma at a cost, including approaches, of about 8,000,000 rubles (\$4,000,000).

Coal production in the business half-year just completed showed a decline, according to Government reports, but continued about 15 per cent greater than in the corresponding previous half-year. The coal program for the current business year, 1927 to 1928, has been set at 37,000,000 metric tons, in keeping with a plan to gradually increase output to about 69,000,000 tons in 1932 to 1933. It is planned to sink 24 new mines, and existing mines are to be almost entirely electrified and equipped with modern machinery. The proposed total investment in the next five years is placed at 900,000,000 rubles, of which 210,000,000 rubles is for construction of miners' dwellings.

Export Trade in Fair Volume

Tin Plate and Rails Bought by Japan—Steel Importers Here Protest New Shape Duty

NEW YORK, July 10.—Export business is confined mainly to orders for small lots of material. Demand for barbed wire from South America continues good, and a fair tonnage of tin plate seconds is moving to Japanese and Chinese consumers. The Kioto Oil Co. in Japan, which inquired recently for about 12,000 base boxes of oil can tin plate and was reported to have closed on 3000 boxes a week ago, has also placed 4000 boxes of primes with a large Japanese export house and 1500 boxes of primes and 4000 boxes of seconds with another Japanese exporter, bringing the total purchase of primes and seconds to 12,500 base boxes.

There is very little business in the market for light-gage black sheets, except for occasional purchases by Japanese consumers willing to pay a premium for the American product. A large Japanese galvanizing plant, which produces a special brand of light-gage galvanized sheet, has placed its usual requirements of 5000 tons of black sheets, of which 3000 tons went to an American maker and 2000 tons to British and Continental mills. Export prices on light-gage black sheets continue at about \$76 per

ton for American sheets and \$73.50 per ton for the British product.

The only rail business that has been in the market from the Far East is about 9 miles of 91-lb. and 100-lb. sections for Tokio municipality, which has been awarded to a large American maker by one of the leading Japanese exporters.

Importers Want New Duty Postponed

A brief filed with the United States Treasury Department by importers of steel who are affected by the ruling that bar mill sizes of channels, angles and tees are dutiable as bars points out that they were not given an opportunity to present their case prior to the decision and, with only 30 days from the time of publication allowed before the new duty goes into effect, they are likely to suffer considerable loss on business taken on the basis of the former rate. The brief filed by the importers points out that the paragraph on structural shapes adequately covers the bar mill sizes of 3 in. and smaller. The further claim is made that larger than 3-in. shapes can be rolled on a bar mill and one domestic mill produces such shapes.

Time Extension Requested

In addition to the protest against any change in the classification of this material, the importers request an extension of four months in the time allowed before the application of the new duty, to permit the clearance of orders to which they were previously committed. The present strike of dock workers in Antwerp is given as one reason for a delay, as it is claimed that many shipments which would have normally been delivered by this time have been delayed by the strike.

Application of the bar classification to bar mill sizes of channels, angles and tees will particularly affect importers with orders for furring channels. Under the structural paragraph of the tariff the duty amounts to 20c. per 100 lb. regardless of cost, but under the bar paragraph the duty is 30c. per 100 lb. on material costing less than 1.50c. per lb. at the mill and 50c. per 100 lb. on material costing more than 1.50c. at the mill. Furring channels cost about \$36 per ton, f.o.b. mill, or about 1.60c. per lb., and would be subject to the duty of 50c. per 100 lb.

Germans Offer Corrugated Sheets for Export

HAMBURG, GERMANY, June 23.—Mills are renewing their efforts to establish an export trade in corrugated galvanized sheets, and a few orders have been booked for shipment to consumers in Mediterranean and northern European countries, to which water freight rates are in many cases cheaper than from British ports. This helps to offset the lower price of British sellers. The minimum quotation by German makers is about £13 12s. 6d. (\$66.36) per ton, f.o.b. port.

Machinery Markets and News of the Works

Implement Makers Continue Buying

Wright Aeronautical and General Electric Purchases Also Contribute
to Fair Rate of Activity—Louisville & Nashville Railroad
Preparing Sizable List

PURCHASES by farm implement makers and builders of tractors, and also by the Wright Aeronautical Corporation and the General Electric Co., were outstanding in the machine tool business the first ten days of July. Continued buying by the implement and tractor industries is expected, programs of machine tool needs for production schedules for the opening of 1929 being in progress.

Bookings in almost all territories have held up fairly well, with something of a spurt in the Cleveland district.

The combined purchases of the Wright and General Electric companies will total large. The Wright company, in preparing to occupy an addition to its plant, is planning for a production of 250 airplane engines per month, which is more than double its present output. Production of 500 engines a month is the plan in connection with the completion of a second addition to the plant. Purchases by the General Electric Co. are for its refrigerating machinery department and a number of machine tools have already been bought.

Buying by the automotive industry has been light, although there has been some demand from makers of parts in the Cleveland and Detroit districts.

Railroad inquiry includes a few machines for the Rock Island and the Chicago & North Western. The Louisville & Nashville is said to be preparing a sizable list for shops at Mobile, Ala. The Illinois Central is asking for prices on the rebuilding of a number of old lathes. The Boston & Albany has closed on most of its list of 25 or more tools.

The Timken Roller Bearing Co., Canton, Ohio, has issued a small list of machine tools for use in its maintenance department.

Some of the fair sized sales of the week were: 15 engine lathes to a Middle West manufacturer, 10 presses and drilling machines to the National Acme Co., Cleveland, 10 automatic screw machines to the Gairing Tool Co., Detroit, and seven turret lathes to the Fulton Syphon Co., Knoxville, Tenn.

New York

NEW YORK, July 10.

LARGE purchases by the General Electric Co., Schenectady, and the Wright Aeronautical Corporation, Paterson, N. J., featured machine tool business of the first 10 days of July. Otherwise the market was rather dull, presumably because of the mid-week holiday. June volume, however, was good; in the case of one important dealer it was the largest June business since 1920. The General Electric Co. is buying for its refrigerating machinery department, its orders to date covering a considerable number of Acme and Brown & Sharpe automatic screw machines and Bliss presses and other miscellaneous tools. Fresh inquiries from this company have also been sent out, the latest asking for prices on four turret lathes, three radial drills, an engine lathe and a threading machine.

Wright Aeronautical Corporation, which is about to occupy a new unit added to its plant, is buying a large lot of equipment to carry out a production program of 250 airplane engines a month, more than doubling its present capacity. Original plan was to equip for 500 engines a month, but the remainder of this expansion will be deferred pending completion of a second plant addition. Combined purchases of General Electric Co.

and Wright Aeronautical Corporation will run into hundreds of thousands of dollars. Railroad buying is at a minimum, but a sale of a locomotive axle journal turning lathe to a Western road is reported.

Plans have been approved by Union Bag & Paper Corporation, Woolworth Building, New York, for new mill at Vancouver, Wash., to cost approximately \$250,000 with equipment, scheduled for

completion in December. Columbia River Paper Mills, Vancouver, will furnish considerable paper stock for new plant and will carry out an expansion program to cost close to \$150,000, including additional machinery.

Sylvestre Oil Co., Inc., Mount Vernon, N. Y., has purchased property on Newton Creek, New York, and plans early construction of new storage and distributing plant with capacity of 2,500,000 gal. A stock issue to total \$250,000 is being sold, larger part of proceeds to be used for project.

Beam O'Lite Sign Co., New York, manufacturer of electric signs, etc., has leased space in building at 981 Eighth Avenue, for new local plant.

Levine & Wipkin, 11 West Forty-second Street, architects, have plans for a three-story automobile service, repair and garage building to cost in excess of \$150,000 with equipment.

Long Island Motor Corporation, Long Island City, has leased a new one-story building on Sunswick Street for a service, repair and garage unit, including machine and parts departments.

Edward Purvis & Son, York and Jay Streets, Brooklyn, manufacturers of mechanical equipment, have acquired plant of Bucyrus Road Machinery Co., Bucyrus, Ohio, bankrupt, which has been idle for about five years, for a price of \$52,500, and will take possession at once. Works will be remodeled for production of air compressors, engines and kindred equipment.

Ovens, power equipment, conveying machinery and other equipment will be installed in new three-story plant to be erected by Cushman's Sons, Inc., 1819 Broadway, New York, at White Plains, N. Y., to cost about \$350,000. Francisco & Jacobus, 511 Fifth Avenue, New York, are architects.

J. F. Perrine, 31-35 Buell Street, East Elmhurst, L. I., architect, has plans for a one-story automobile service, repair and garage building, 100 x 200 ft., to cost \$100,000 with equipment.

Board of Education, Pelham, N. Y., contemplates installation of manual training equipment in addition to Memorial High School, Pelham Manor, to cost in excess of \$400,000. Charles M. Hart, Pelham Manor, is architect.

John A. Panzer, operating an automobile service and garage building at 1045 Bay Street, St. George, S. I., New York, has formed Lexington Garage & Auto Parts Co. New organization has acquired

The Crane Market

NEW inquiry for locomotive and overhead cranes has been light, but there is some good business pending, particularly in the export field. Bids have been submitted on overhead traveling cranes for South Africa and Turkey and on locomotive cranes and steam shovels for shipment to Argentina, Turkey, Persia and South America construction projects. Action on the list of locomotive cranes and steam shovels inquired for by Dwight

P. Robinson & Co., New York, for export to Buenos Aires, Argentina, is expected about Aug. 1. The Galion Iron Works & Mfg. Co., Gallon, Ohio, is in the market for a used 5 to 7-ton, 75 to 90-ft. span overhead crane for yard service.

Among recent purchases are:

New Jersey Zinc Co., New York, 10-ton crawl-tread locomotive crane from Orton Crane & Shovel Corporation.

E. I. du Pont de Nemours & Co., chemical products division, Parlin, N. J., 25-ton, 8-wheel, locomotive crane from Orton Crane & Shovel Corporation.

International Railway Co., Buffalo, N. Y., 25-ton standard locomotive crane from unnamed builder.

General Electric Co., 15-ton overhead traveling crane from Niles Crane Corporation.

property on Pleasant Plains Boulevard, Tottenville, and plans construction of new main works, including repair and parts departments, to cost more than \$80,000.

Hale Desk Co., 7 East Forty-fourth Street, New York, has leased seven-story and basement building at 531-35 West Thirty-seventh Street, totaling 110,000 sq. ft. floor space, for new plant and will remove to new location.

New York Dock Co., 44 Whitehall Street, New York, has awarded general contract to White Construction Co., 95 Madison Avenue, for new multi-story factory and distributing plant at Brooklyn, totaling about 900,000 sq. ft. of floor space, to cost more than \$2,000,000 with equipment.

Wright Aeronautical Corporation, Railway Avenue, Paterson, N. J., has awarded general contract to John W. Ferguson Co., 152 Market Street, for two four-story additions, each about 300 ft. long, to cost in excess of \$600,000 with equipment.

Radio Tube Corporation, 88 Eighth Avenue, Newark, has taken out a permit for a new three-story plant, to cost \$75,000 with equipment. Siegler & Greenberg, 164 Market Street, are architects.

Air Marine-Klemm Corporation, recently organized by Ingliis M. Uppercu; head of Uppercu-Cadillac Corporation, 536 Broad Street, Newark, will take over a portion of plant of Aeromarine Plane & Motor Co., Keyport, N. J., for a new works for manufacture of low-powered monoplanes, including parts and assembling divisions, to be known as Klemm-Daimler airplane. Hans Klemm, designer, will be an official of new company, in charge of production.

Austin Furnace Co., 105 Avenue L, Newark, has filed plans for new storage and distributing plant to cost about \$175,000 with equipment.

United States Aircraft Co. of New Jersey, Inc., care of Joseph H. Edgar, 5 Elm Row, New Brunswick, N. J., recently formed by Condit S. Atkinson, Jr., Highland Park, N. J., and associates, with capital of \$125,000, plans operation of plant in this section for production of airplanes.

Jersey City Cadillac Co., 2401 Boulevard, Jersey City, N. J., local representative for Cadillac automobile, has awarded general contract to Billington & Son, 198 Fairmount Avenue, for two-story service, repair and garage building at North Bergen, N. J., to cost about \$125,000 with equipment. C. G. Eicholz, Jr., State Theater Building, Union City, N. J., is architect.

Manning, Maxwell & Moore, Inc., 100 East Forty-second Street, New York, has purchased American Schaeffer & Budenberg Corporation, with plants at Brooklyn and Worcester, Mass., manufacturer of industrial recording instruments, and will consolidate business with that of Consoli-

dated Ashcroft Co., Inc., manufacturer of valves, indicating and recording instruments, which is controlled by Manning, Maxwell & Moore. Change in operation will take place at once.

New England

BOSTON, July 9.—The machine tool market in the territory the past week has been inactive, due in part to a large number of New England industrial plants taking inventory. The Boston & Albany Railroad is reported to have practically finished its purchases of a list of some 25 tools. Other business was confined for the most part to a few used tools for shops in the Boston district. The city of Boston has not yet closed on its Hyde Park district school machinery requirements and no definite information is had as to when purchases will be made. New inquiries continue scarce. Small tools are selling freely.

A report issued by Associated Industries of Massachusetts shows that metal working companies operated at 100.1 per cent of capacity in May, contrasted with 90.9 per cent in April and 96.8 per cent in May, 1927. A Government department report covering June operations shows a falling off in that month but because of incomplete data upon which a basis was made exact figures, in percentages, are withheld.

Worcester Taper Pin Co., Worcester, Mass., which recently absorbed Christianson Screw Co., Newton, Mass., is located at 9 May Street, Worcester. Thomas Crabtree is president and treasurer. Frank Calverly is superintendent and O. A. Jones sales manager.

Providence, R. I., has plans for a repair shop for its fire department to cost, without equipment, \$80,000.

Plans have been filed by Hartford Gas Co., Hartford, Conn., for one-story machine equipment building to cost \$60,000.

Millbury Steel Foundry Co., Millbury, Mass., is planning one-story addition, 60 x 100 ft., to be used primarily for power plant service, to cost close to \$50,000 with equipment.

American Thermos Bottle Co., Norwich, Conn., is planning for new unit to total about 42,000 sq. ft. floor space, to double present capacity, to cost more than \$100,000 with equipment.

Fellows Brass & Iron Foundry, Waterville, Me., has acquired former factory of Bent Bed Co., Medford, Mass., for new main plant and will remove to new location. Capacity will be increased.

Beaudette Mfg. Co., Crescent Avenue, Chelsea, Mass., manufacturer of radio equipment, has plans for two-story ad-

dition, to cost in excess of \$40,000 with machinery. Schein & Levine, 448 Broadway, are architects.

Meisel Press Mfg. Co., 944 Dorchester Avenue, Dorchester, Boston, manufacturer of printing presses, has awarded general contract to W. H. Bailey Co., 88 Broad Street, Boston, for one and two-story addition, 100 x 220 ft., to cost close to \$150,000 with equipment.

Maine Steel Products Co., South Portland, Me., recently organized, has taken over local plant and business of Marine Hardware Equipment Co., and plant and assets of Union Iron Works, Bangor, Me. A general expansion program will be carried out at both plants for increased output of snow plows and other snow removal machinery, as well as marine and affiliated hardware products. George C. Soule is head of new company.

City Building Department, City Hall, Providence, R. I., T. J. H. Pierce, city architect, is having plans drawn for a municipal repair and equipment shop to cost close to \$60,000.

Pittsburgh

PITTSBURGH, July 9.—Following recent purchase of plant and business of Zenith Aircraft Co., Scottdale, Pa., by Charles Semans, Uniontown, Pa., and associates, arrangements are being made for immediate removal of works to a building at last-noted place, where increased production facilities will be provided.

Harbison-Walker Refractories Co., Farmers Bank Building, Pittsburgh, has abandoned plans for present for construction of new plant on large tract recently acquired on Patapsco Avenue, Baltimore, to cost more than \$500,000, and project will be held in abeyance.

Keystone Sand & Supply Co., 302 Penn Avenue, Pittsburgh, has work under way on new sand and gravel handling and storage plant on South Third Street, to include a battery of 10 elevated steel bins, ground bins, conveying and loading equipment, and other handling apparatus; a boiler plant will be installed. Entire project is reported to cost more than \$125,000.

W. L. Mack of Erie Engine Works, Erie, Pa., manufacturer of stationary engines, parts, etc., is at head of new company, to be known as Thermal Unit Corporation, to operate a plant in vicinity of New York for manufacture of heat transmission equipment, including piping, tubing, etc. Walter A. Curtzo, Erie, is also interested in new organization.

United States Aluminum Co., New Kensington, Pa., is planning a one-story addition, to cost in excess of \$40,000 with equipment. E. S. Fickes is chief engineer, in charge.

Board of Allegheny County Commissioners, City-County Building, Pittsburgh, R. G. Woodside, in charge, is considering establishment of a new airport to cost more than \$500,000, including hangars, repair shops, oil storage and distributing works and other mechanical units.

Duquesne Light Co., 436 Sixth Avenue, Pittsburgh, will make extensions and improvements in station and system at Midland, Pa., to cost about \$25,000.

C. H. Mussleman Co., Biglerville, Pa., has acquired property at Ranson, W. Va., and plans early construction of new canning and evaporating plant, reported to cost more than \$50,000 with equipment.

Philadelphia

PHILADELPHIA, July 9.—Bids will be received by Day & Zimmermann Engineering & Construction Co., 1600 Walnut Street, Philadelphia, acting for Board of Trustees, Eastern State Penitentiary, until July 16 for gasoline-driven concrete mixers, non-tilting type, with power loading attachment and water tank, mounted on steel wheels, for penitentiary near Graterford, Pa.

Columbia Steel Equipment Co., Third and Annsbury Streets, Philadelphia, manufacturer of steel filing equipment, has awarded contract to Harry H. Wehmeyer, 509 West Cumberland Street, for a second story addition to factory unit, 66 x 75 ft.

Simon Kaplan, 243 South Sixty-second Street, Philadelphia, has filed plans for a four-story automobile service, repair and garage building, to cost about \$90,000 with equipment.

York Ice Machinery Co., Belmont and Thompson Streets, Philadelphia, manufacturer of ice-making and refrigerating equipment, with headquarters at York, Pa., will soon begin erection of new three-story and basement factory unit, to cost close to \$100,000 with equipment.

Universal Service Motors Co., Broad and Pine Streets, Philadelphia, has taken over property at Second and Sansom Streets, totaling about 15,000 sq. ft. ground space, and plans erection of seven-story service, repair and garage building, to cost about \$175,000 with equipment.

Well-Bilt Furniture Co., Philadelphia, has leased four-story factory at 337 North Second Street, totaling about 50,000 sq. ft. floor space, for new plant.

Edward H. Reuss, Jr., Thirtieth and Race Streets, Philadelphia, manufacturer of pipe, heating equipment, etc., and associates, have organized Philadelphia Steam Co., for which application for State charter will be made, to construct and operate a central steam power plant for heating service. Walter B. Reed and J. Percy Bell, care of Frank M. Hunter, Gibson Building, Chester, Pa., are interested in new company.

City Council, Beach Haven, N. J., has awarded general contract to Floyd L. Cranmer, Beach Haven, for addition to municipal electric light and power plant, to cost about \$50,000 with equipment. William H. Boardman is engineer, in charge.

Board of Education, Pleasantville, N. J., plans installation of manual training equipment in new three-story high school to cost \$635,000, for which revised plans have been approved and bids will be asked at once on general contract. S. Hudson Vaughn, Guarantee Trust Building, Atlantic City, N. J., is architect.

City Council, Reading, Pa., plans installation of pumping machinery and other power equipment in connection with

a 40,000,000-gal. mechanical filtration plant, to cost more than \$650,000.

Oliver United Filters, Inc., has been formed to take over and consolidate United Filters Corporation, Hazleton, Pa., and Oliver Continuous Filter Co., Oakland, Cal., manufacturers of industrial filters and filtering machinery. Both plants will be continued in service. New company will dispose of stock issue to total about \$2,600,000, a portion of fund to be used for expansion and betterments. E. J. Sweetland, formerly president of United company, will be chairman of board, and Edwin L. Oliver, president.

Lehigh Valley Cold Storage Co., Bethlehem, Pa., will make extensions and improvements in cold storage plant, including installation of new ice-manufacturing division, to cost in excess of \$200,000 with machinery.

Board of Education, Altoona, Pa., plans installation of manual training equipment in new two and three-story and basement high school, to cost \$750,000, for which bids are being asked on general contract until July 20. Hersh & Sholler, Commerce Building, are architects.

E. D. Hawk, New Castle, Pa., and associates have taken over former plant of Slagstone Products Co., East New Castle, and will remodel for production of electric storage batteries and kindred products.

Natural Products Co., Inc., 46 West Chestnut Street, Reading, Pa., has been formed to operate warehouse for distribution of foundry supplies and operate sand banks. Warren S. Adams is president.

So. Atlantic States

BALTIMORE, July 9.—Contract has been let by Standard Fertilizer Co., Inc., Williamston, N. C., subsidiary of Standard Wholesale Phosphate Co., Continental Building, Baltimore, to S. S. Toler, Rocky Mount, N. C., for second unit of plant, to cost more than \$45,000 with equipment. Work will include a new wharf and shipping facilities.

City Council, Front Royal, Va., is completing surveys for new municipal airport on 40 acre site, to include hangar, repair shop, oil storage and distributing building, and other units.

Otto Equipment & Service Co., Thirty-third Street, Philadelphia, manufacturer of gas engine equipment, has leased space in building at Guilford Avenue and Saratoga Street, Baltimore, for factory branch and distributing plant.

Stribling Aircraft Co., Macon, Ga., care of W. L. Stribling, Macon, recently organized by Mr. Stribling and son, is negotiating for lease of Miller Field for establishment of aircraft works, including repair and parts shops, oil storage and distributing building and other structures. Company will also establish and operate a flying school; it will be capitalized at \$250,000.

Bedford Pulp & Paper Co., Bedford, Va., is planning construction of hydroelectric power plant on James River, near Snowden, Amherst County, for power supply for pulp and paper mill.

International Paint Co., 1828 West North Avenue, Baltimore, is said to be planning new three-story plant at Dundalk, to cost about \$75,000 with equipment. C. R. Sutter is general manager.

Tidewater Body & Fender Works, Inc., Norfolk, Va., recently formed by B. W. Woodard, 418 New York Avenue, and associates, with capital of \$50,000, plans operation of sheet metal works, for which details will soon be completed.

General purchasing officer, Panama Canal, Washington, will receive bids until July 27 for cranes, floor grinders, tool grinders, locomotive castings, metal cabinets, hacksaw blades, drills, wrenches, pumps, motor-generator set, electric rivet heaters and other mechanical and electrical equipment, Panama schedule 1887.

Lexington Water Power Co., Columbia, S. C., operated by General Gas & Electric Corporation, 50 Pine Street, New York, has work in progress on new hydroelectric generating plant on Saluda River, about 10 miles from Columbia, and is scheduling completion late in 1930. Miscellaneous equipment awards will be made soon.

Georgia Manganese & Iron Co., 201 Hurt Building, Atlanta, Ga., has engaged Perin & Marshall, 40 West Fortieth Street, New York, consulting engineers, to complete plans for its development of manganese ore properties near Cartersville, Ga., including installation of mining and refining equipment, with mechanical washing plant. Entire project is reported to cost close to \$1,500,000. Joel Hurt is head.

Peoples Ice & Storage Co., Wilson Street, Roanoke, Va., is planning erection of seven-story ice-manufacturing and cold storage plant, 150 x 160 ft., to cost in excess of \$100,000 with equipment.

Rose Clic Co., Waynesboro, Va., plans rebuilding machine shop recently destroyed by fire, with loss, including portion of packing plant, about \$30,000 with equipment.

Detroit

DETROIT, July 9.—Arrangements have been completed by Alloy Steel Spring & Axle Co., Jackson, Mich., for purchase of local plant and business of National Plating & Enameling Co., and will operate in future as a division of organization. Expansion in output is under consideration.

Consumers Power Co., Jackson, Mich., has approved plans for an addition to steam-operated electric power plant at Zilwaukee, near Saginaw, Mich., to include installation of new 35,000-kw. turbo-generator unit; four boilers, with economizers, air pre-heaters, and auxiliary equipment; pumping equipment, etc. Increase will also be made in transmission system. Entire project will cost in excess of \$2,000,000.

Chevrolet Motor Co., 3044 West Grand Boulevard, Detroit, has awarded general contract to Kansas City Structural Steel Co., Kansas City, Mo., for new assembling plant at Leeds, Mo., 300 x 760 ft.; body building plant, 170 x 760 ft.; service and parts unit, 120 x 275 ft.; power house, 46 x 70 ft.; office and miscellaneous structures, all one-story, to cost in excess of \$1,000,000 with equipment. A loading dock, 40 x 220 ft., will also be built. Albert Kahn, Marquette Building, Detroit, is architect.

George Bachman, Flint P. Smith Building, Flint, Mich., architect, will soon take bids on general contract for three-story automobile service, repair and garage building, to cost about \$125,000 with equipment.

Forham Tool Co., Detroit, care of Lane, Davenport & Peterson, Charlevoix Building, architects, is having plans drawn for new two-story plant to cost about \$65,000 with equipment.

Pontiac Foundry & Machine Co., Pontiac, Mich., recently organized with capital of \$75,000, has taken over building

on Scott Lake Road, previously used by Howard Foundry Co., for new plant for production of brass, bronze and aluminum castings for automotive and aircraft industries; department will be established for manufacture of metal patterns, as well as dies, and kindred specialties. Robert Falstead, Birmingham, Mich., heads company.

Kalamazoo Stationery Co., Harrison Street, Kalamazoo, Mich., has plans under way for new power plant at factory to cost \$50,000 with equipment. Billingham & Cobb, 211 Woodward Avenue, are architects.

Jackson Screw Products Co., Jackson, Mich., will rebuild portion of plant destroyed by fire July 4, with loss reported at \$40,000 including equipment.

Motor Products Corporation, 11801 Mack Avenue, Detroit, manufacturer of metal stampings for automotive service, is said to be planning a one-story addition, to cost more than \$45,000 with equipment.

Cleveland

CLEVELAND, July 9.—Machine tool sales took quite a spurt the past week. There was a fair volume of activity in single machines well distributed among various industries and several orders were for good sized lots. Some new demand sprang up from makers of automobile parts in both the Cleveland and Detroit territories, although no buying is reported by automobile manufacturers. The National Acme Co., Cleveland, purchased 10 presses and drilling machines for extending its facilities for manufacturing shock absorbers. The Gairing Tool Co., Detroit, bought 10 automatic screw machines. The Fulton Syphon Co., Knoxville, Tenn., bought seven turret lathes. The Timken Roller Bearing Co., Canton, Ohio, has issued a small list of machinery requirements for its maintenance department, which includes lathes, bolt cutters and horizontal boring mills.

Thompson Products Co., Inc., Cleveland, maker of valves and other automobile parts, will spend \$750,000 on additions to plants. A two-story extension, 62 x 122 ft., will be built at its Cleveland plant and a two-story extension, 100 x 140 ft., to its Detroit plant. Plans also contemplate erection next year of two other units at Cleveland for machine shop and heat treating departments and another unit in Detroit for a forging department.

Merger of four leading manufacturers of rubber making machinery has been concluded. Companies comprise Akron Rubber Mold & Machine Co. and Quhlke Machine Co., Akron, Ohio; Banner Machine Co., Columbiana, Ohio, and DeMattia Brothers, Inc., operating a foundry and machine shop in New Jersey. Stanley Harris, president Akron Mold & Machine Co., is temporary president of new organization; Barthold DeMattia, vice-president, and M. D. Quhlke, secretary.

Eaton Axle & Spring Co., Cleveland, has acquired Easy-on-Cap Co., Cleveland, maker of gasoline tank, breather tube, radiator and crank shaft caps. Latter company will continue under present management in a new plant containing 50,000 sq. ft. of floor space, which will be erected on a site adjoining East 140th Street plant of Eaton Axle company. Hub caps will be added to present products.

Cleveland Duplex Machinery Co., Inc., Cleveland, has been appointed agent in northeastern Ohio for Grant Mfg. & Machine Co., Bridgeport, Conn., in sale of rivet spinners, vibrating riveters, double end threading and chamfering machines and special machinery.

Massillon Rivet & Mfg. Co., 614 Erie Street, South, Massillon, Ohio, has been formed to succeed Canton Bolt Co., Canton, Ohio, and has removed to plant at Massillon where facilities for manufacture of small rivets has been increased. Company is equipped to manufacture steel, brass, copper, aluminum and enduro metal rivets in following coatings and finishes: Galvanized, metallic tinned, tin plated, coppered, nickel plated, brass plated, copper plated and bright polished after annealing.

Contract has been let by Gears & Forgings, Inc., East Ninety-second Street, Cleveland, to R. S. Ursprung, Berea, Ohio, for a one-story addition, 50 x 135 ft., to cost about \$45,000, with equipment.

Libbey-Owens Sheet Glass Co., Nicholas Building, Toledo, Ohio, has awarded general contract to A. Bentley & Sons Co., 201 Belmont Avenue, for new plant primarily for manufacture of laminated safety glass products, to cost \$1,500,000 with equipment. Lockwood, Greene & Co., 400 North Michigan Boulevard, Chicago, are architects and engineers.

Henry & Murphy, Second National Bank Building, Akron, Ohio, architects, have completed plans for two-story automobile service, repair and garage building on South High Street, reported to cost close to \$90,000, with equipment.

Ohio Foundry Co., 2469 East Seventy-first Street, Cleveland, has awarded general contract to H. B. Slatmyer & Son Construction Co., 203 Lakeside Avenue, for one-story addition to cost approximately \$100,000 with equipment.

Cincinnati

CINCINNATI, July 9.—While some machine tool builders report a recession in sales since the first of the month, bookings have held up fairly well. Agricultural implement makers have been the largest buyers of equipment, their purchases in this market having included engine lathes, drilling machines and special high production tools. Notable among the week's bookings has been a sale of 15 18-in. motor-driven engine lathes to a Middle West manufacturer. A local company has received an order for three engine lathes from a South American company and also will supply a gap lathe to a Canadian firm. The Boston & Albany has bought several tools and the Rock Island is said to be inquiring for a few machines.

Stanton Motors, Inc., 841 North High Street, Columbus, has plans for two-story and basement service, repair and garage building, to cost close to \$100,000 with equipment. Richards, McCarty & Bulford, Columbus, are architects.

Kentucky River Coal Co., Fayette National Bank Building, Lexington, Ky., W. S. Dudley, president, is reported planning construction of pipe line for natural gas supply from its coal mining properties to vicinity of Knoxville, Tenn., with compressor plants, etc.

Adrian Knitted Products Co., Dyersburg, Tenn., plans construction of steam power

house in connection with a new local mill, entire project to cost close to \$200,000. Robert & Co., Bona Allen Building, Atlanta, Ga., are architects and engineers. Headquarters are at Adrian, Mich.

Van Buren Township Board of Education, Dayton, Ohio, care of Walker & Norwick, American Building, architects, plans installation of manual training equipment in new high school to cost about \$450,000, for which bids will be asked on general contract by architects noted.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until July 19 for runner assemblies, cable assemblies, cord assemblies, ski assemblies, and shock absorber assemblies, circular 33.

Dudney Tire Co., Nashville, Tenn., has leased building to be erected at 1217-21 Broadway, for new factory branch, service and distributing plant to cost \$100,000; general contract let to J. J. Dugger, Carmack Avenue.

Ovens, power equipment, conveying and other machinery will be installed in new two-story and basement plant, 60 x 200 ft., to be erected by Linker Brothers, 1129 West Market Street, Louisville, on adjoining site, to cost about \$115,000. D. X. Murphy & Brothers, Louisville Trust Building, are architects.

Buffalo

BUFFALO, July 9.—Bids will soon be asked by International Casement Co., Hopkins Avenue, Jamestown, N. Y., manufacturer of steel casements, casement adjustments, etc., for a one-story addition, to cost close to \$40,000 with equipment. Beck & Tinkham, Bailey Building, are architects.

Hecker, Jones, Jewell Milling Co., St. Clair Avenue, Buffalo, has filed plans for a new mill unit to be equipped for mechanical washing and drying, to cost \$50,000.

Frank B. Floyd, 110, Eloise Terrace, Syracuse, N. Y., and associates, have organized Smith Trailer Corporation and plan early operation of plant for manufacture of trailers and other agricultural equipment. George G. Heidlauf, 126 Coleridge Avenue, is also interested in company.

City Council, City Hall, Lockport, N. Y., will receive bids until July 23 for motor-driven centrifugal pumping equipment for high and low service, standpipe addition, valves, and other equipment for filtration plant. J. N. Chester Engineers, Clark Building, Pittsburgh, are engineers.

Board of Education, Watertown, N. Y., is considering installation of manual training equipment in new South Side junior high school, to cost \$450,000, for which bids will soon be asked on general contract on revised plans. Lansing & Green, Sherman Trust Building, are architects.

Cortland County Traction Co., Cortland, N. Y., operating electric light and power utilities, has secured permission to make extensions in transmission lines and facilities for service at Virgil, N. Y., and vicinity.

Remington Rand, Inc., Buffalo, manufacturer of office equipment, has removed its general purchasing department from Ilion, N. Y., to Remington Rand Building, 465 Washington Street, Buffalo. L. Rayburn is director of purchases.

Chicago

OF special interest in this market is activity among farm implement manufacturers and builders of tractors in laying out programs for machine tool needs for production schedules at the opening of 1929. Meantime these industries continue to place orders in good volume for their immediate needs. This business, plus that which is coming from gasoline engine builders, has held the first week in July on a par with the closing seven-day period in June. The new month makes a good start when compared with July, 1927.

The Chicago & North Western is in the market for an axle lathe, pattern grinding and filing machine and a drill grinder. The Illinois Central is asking for prices on rebuilding a number of old lathes. The Louisville & Nashville is preparing a sizable list for its shops near the new State docks, Mobile, Ala. Used machinery is moving in good volume.

Emerson - Brantingham Corporation, Rockford, Ill., has announced sale of its farm machinery plant at Rockford and its farm machinery inventory at works and branches to J. I. Case Threshing Machine Co., Racine, Wis., effective Aug. 1.

Martin Machine Works, 220 Laflin Avenue, Chicago, will build a factory, 48 x 125 ft., to cost \$18,000.

Bids will be received by Board of Trustees, Springfield Sanitary District, City Hall, Springfield, Ill., until July 25 for equipment for municipal sewage plant, including centrifugal sump pumps, sludge pumps and hot water circulating pumps; two motor-driven air blowers, 2200 and 3300 cu. ft. per min., capacity, respectively; and electrical equipment, with seven-panel power switchboard. Pearce, Greeley & Hansen, 6 North Michigan Avenue, Chicago, are engineers.

School District No. 45, 422 South Fairview Avenue, Elmhurst, Ill., I. A. Stone, secretary, is considering installation of manual training equipment in three-story addition to York high school to cost \$350,000, for which plans are being drawn by J. C. Llewellyn, 38 South Dearborn Street, Chicago, architect.

Chicago Metal Spinning Co., 1715 Walnut Street, Chicago, has work nearing completion on new two-story and basement plant unit, 38 x 53 ft.

American Wood Products Co., 258 S. E. Cecil Street, St. Paul, Minn., will soon take bids for new two-story plant, to cost about \$90,000 with equipment.

Produce Terminal Cold Storage Co., Chicago, care of Henschien & McLaren, 1637 Prairie Avenue, architects, will proceed with superstructure for a new eleven-story cold storage and refrigerating plant on West Fifteenth Place, 108 x 220 ft., to cost close to \$2,000,000 with machinery. Work is scheduled for completion by close of year when it is purposed to begin erection of a second unit adjoining.

Community Motor Co., Thirty-third Street and Prairie Avenue, Chicago, has taken out permit for a two-story service, repair and sales building, 128 x 177 ft., to cost close to \$90,000 with equipment. L. E. Russell, 140 South Dearborn Street, is architect.

Public Service Co. of Colorado, 900 Fifteenth Street, Denver, Colo., has filed plans for a one-story foundry and shop, 40 x 60 ft. and 20 x 32 ft.

Newton Mfg. Co., Newton, Iowa, manufacturer of advertising novelties, has approved plans for a two-story addition to cost about \$40,000 with equipment.

Caterpillar Tractor Co., East Peoria, Ill., is contemplating erection of new one-story foundry, to cost approximately \$50,000 with equipment. Headquarters are at Oakland, Cal.; M. M. Baker is local manager at East Peoria.

Northern Pacific Railroad Co., St. Paul, Minn., has plans for new one-story steel car construction and repair shops at Laurel, Mont., to cost upward of \$160,000 with equipment.

Albertson & Co., Sioux City, Iowa, manufacturers of tools and shop equipment, will build an addition to factory to cost \$100,000 for expansion of production facilities.

O. C. Keckly Co., Chicago, has acquired controlling interest in Lourie Mfg. Co., Harvard Park, Springfield, Ill., and offices at latter city are being transferred to Chicago. H. M. Alkire, vice-president in charge of manufacturing, states that expansion of Springfield unit is contemplated. Lourie line of hydraulic presses will be continued and in addition Keckly company will install equipment for manufacture of water gage specialties.

Indiana

INDIANAPOLIS, July 9.—Syracuse Electric & Telephone Co., Syracuse, has plans for a one-story equipment storage and distributing plant, with utility and repair department, 40 x 100 ft. Bradley & Babcock, 221 West Wayne Street, Fort Wayne, are architects.

Refrigerating equipment, conveying and other machinery will be installed in new plant to be built by Emge Packing Co., Fort Branch, to cost about \$100,000, for which building contract has been let to Scarborough & Davis, Old State Bank Building, Evansville.

Board of Park Commissioners, City Hall, Fort Wayne, has plans for hangars, with repair facilities, and other buildings at municipal airport, for which bids will soon be asked on general contract. Everett I. Brown, First National Bank Building, is architect.

Fame Canning Co., Shelbyville, Ind., is said to have plans for rebuilding portion of local plant recently destroyed by fire, to cost more than \$150,000 with machinery. Headquarters are at 58 East Washington Street, Chicago.

Board of Education, Muncie, will soon lay foundations for one-story vocational training school to cost \$150,000 with equipment, for which bids have been asked on general contract. Houck & Smenner, 108 East Washington Street, are architects.

Power equipment, cold storage and refrigerating machinery, conveying and other handling equipment will be installed in three-story addition, 110 x 256 ft., to be erected by Major Brothers Packing Co., South Logan Street, Mishawaka, to cost close to \$500,000. Packers Architectural & Engineering Co., 431 South Dearborn Street, Chicago, is architect and engineer.

Leader Specialty Co., Inc., 517 East Walnut Street, Indianapolis, has been formed to manufacture plumbing specialties, particularly iron pipe nipples. Company plans first to manufacture nipples from standard steel pipe in sizes ranging from 1/4 x 3/4 in. to 2 x 6 in.

Gulf States

BIRMINGHAM, July 9.—Moody Corporation, Galveston, Tex., operated by Moody-Seagraves Co., Esperson Building, Houston, Tex., has secured an interest in 480 acres of oil lands in Howard County, and plans immediate development. It is purposed to construct an oil refinery, in Big Springs, Tex., section, or in Galveston district, site still to be determined. Pipe line will be constructed from Howard oilfield to new refinery. Entire project is reported to cost in excess of \$1,000,000 with equipment.

Burford Oil Refining Co., Shreveport, La., operated by Crystal Oil Refining Corporation, Shreveport, F. W. Burford, general manager, has begun construction of new oil refinery at Pecos, Tex., with an initial capacity of 5000 bbl. per day. A cracking plant will also be installed for gasoline production and complete treating equipment; also a boiler plant and machine shop. Entire project will cost close to \$700,000 with machinery. J. J. Thomas is superintendent.

Tampa Union Terminal Co., 823 South Orleans Street, Tampa, Fla., has approved plans for a new cold storage and pre-cooling plant on 10-acre tract on Ybor Channel, to be eight stories, 150 x 152 ft.; with two story transit shed, 100 x 465 ft.; and one-story power plant, 50 x 80 ft. Entire project will cost in excess of \$700,000 with equipment. Parsons, Klapp, Brinckerhoff & Douglas, 84 Pine Street, New York, are engineers. Clyde Perry is president.

Transcontinental Oil Co., Fort Worth, Tex., is completing plans for construction of new pipe line from Pecos County oilfields to a point near Texas City, Tex., to cost more than \$200,000. Headquarters are in Benedum Trees Building, Pittsburgh.

F. S. Royster Guano Co., Royster Building, Norfolk, Va., has approved plans for rebuilding its branch fertilizer plant at Birmingham, recently destroyed by fire, to cost close to \$130,000 with equipment.

Duval Texas Sulphur Co., Second National Bank Building, Houston, Tex., is in market for two used steam-driven air compressors, 90 lb. steam pressure, 400 to 500 lb. air pressure, 350 to 500 cu. ft. per min.

Pan-American Airways, Inc., Miami, Fla., will proceed with construction of new airport on Thirty-sixth Street, where tract of about 130 acres recently was secured, to include hangars, 100 x 100 ft., with repair shops, parts and reconditioning units, and oil storage and distributing works, to cost in excess of \$85,000.

Southern United Ice Co., Crystal Springs, Miss., is planning an addition to local ice and cold storage plant to cost approximately \$50,000 with equipment. It is also proposed to build a new two-story unit at Jackson, Miss., to cost close to like sum. W. E. Wells, Inc., 100 West Monroe Street, Chicago, is engineer.

Firestone Tire & Rubber Co., Akron, Ohio, has purchased property at Jacksonville, Fla., and plans early construction of new factory branch and distributing plant, to cost approximately \$100,000 with equipment.

Southern Phosphate Co., Bartow, Fla., is considering plans for new works at Sanguily, vicinity of Tampa, Fla., for phosphate fertilizer manufacture, to cost close to \$50,000 with machinery. Headquarters are at 44 Wall Street, New York.

Cotton Concentration Co., Forty-second Street and Avenue A, Galveston, Tex., has completed plans for one-story com-

press mill, 315 x 340 ft., to cost about \$90,000 with machinery.

Texas Gulf Sulphur Co., Inc., Gulf, Tex., has awarded contract to J. G. White Engineering Corporation, New York, for initial units at local plant, including machine and other mechanical shops, steam power house of 7500 hp. capacity. Other units will be erected later. Headquarters are at 41 East Forty-second Street, New York.

Central Power & Light Co., Frost Building, San Antonio, Tex., has secured permission to proceed with a hydroelectric power project on Devils River, Val Verde County, with construction of power dam and installation of station, to cost more than \$400,000.

St. Louis

ST. LOUIS, July 9.—Bids have been asked on general contract by Century Electric Co., 1806 Pine Street, St. Louis, for one-story and basement foundry, 240 x 262 ft., to cost in excess of \$175,000 with equipment. Klipstein & Rathman, 316 North Eighth Street, are architects. J. L. Hamilton is company engineer and superintendent.

Pillsbury Flour Mills Co., Minneapolis, Minn., has work under way on a new milling plant and elevator, 75 x 300 ft., at Enid, Okla., to cost about \$700,000 with machinery. Jones-Hettelsater Construction Co., Mutual Building, Kansas City, Mo., is general contractor.

Wabash Railway Co., Railway Exchange Building, St. Louis, will soon begin work on one and three-story fruit and produce exchange building, 60 x 640 ft., with ice and cold storage facilities, mechanical handling equipment, etc., to cost \$800,000 with equipment. R. E. Mohr, address noted, is company architect; R. H. Howard is chief engineer.

Board of Education, Loomis, Neb., plans installation of manual training department in connection with rebuilding portion of high school recently destroyed by fire, with loss close to \$50,000. H. P. Helleberg, Masonic Building, Kearney, Neb., is architect.

Chandeyson Electric Co., 4092 Bingham Avenue, St. Louis, manufacturer of electrical equipment, has filed plans for a one-story addition, 32 x 100 ft., to cost close to \$25,000 with equipment. Widmer Engineering Co., Roosevelt Building, is engineer.

Spartan Aircraft Co., 902 North Wheeling Street, Tulsa, Okla., has awarded general contract to Austin Co., Cleveland, for a one-story and basement plant, 150 x 350 ft., to cost close to \$250,000 with equipment. New unit will be used largely for assembling and parts production.

Camden Furniture Co., Camden, Ark., is planning for additions to double, approximately, present capacity, to cost about \$50,000 with equipment.

Arkansas Natural Gas Corporation, Little Rock, Ark., is completing plans for construction of pipe line for natural gas supply from Clarksville, Johnson County, to Little Rock, about 100 miles, to cost in excess of \$1,000,000 with booster stations and other auxiliaries. George T. Koch, Shreveport, La., is chief engineer in charge.

Normandy Consolidated School District, Normandy, Mo., has broken ground for two-story and basement manual training school, 60 x 270 ft., to cost about \$120,000 with equipment. William B. Ittner, Board

of Education Building, St. Louis, is architect.

Mertz Auto Body & Radiator Co., 235 North Sixth Street, East St. Louis, Ill., has asked bids on general contract for new one-story plant unit to cost about \$32,000 with equipment. Seer-Ko Engineering Co., 1632 North Twenty-fifth Street, is architect and engineer.

Milwaukee

MILWAUKEE, July 9.—There has been no perceptible slackening in machine-tool business, and while orders are not of large volume, they are of fair number. Employment in industry, is gaining and a good demand for skilled men for the metal trades is officially reported. It is interesting to note that 44 shops had 36,922 people at work at the beginning of July, compared with 36,777 at work in 46 shops on June 1. The reduction in number of reporting shops is caused by the sale of the Northwestern Malleable Iron Co. and the closing of another shop formerly reporting. The July 1 figure of 36,922 at work compares with 34,542 working in 46 factories a year ago.

National Enameling & Stamping Co., 909 St. Paul Avenue, Milwaukee, is placing contracts through Siebert & Kegler, local architects, for construction of a new administration building, 56 x 135 ft., two stories and part basement. Present office building will be converted for manufacturing.

Klug & Smith Co., consulting engineer, 69 East Wisconsin Avenue, Milwaukee, has general contract to build a brick and steel shop bay addition, 28 x 134 ft., for Smith Engineering Works, manufacturer of ore, rock and gravel handling machinery, 78 Capitol Drive.

Wisconsin Cold Storage Co., 178 Florida Street, Milwaukee, is asking bids through C. F. Ringer & Son, architects, 432 Broadway, for erection and equipment of an eight-story cold storage warehouse to cost \$500,000. Henry C. Kuehn is secretary and treasurer.

J. D. Phillips, business manager Board of Regents, University of Wisconsin, Madison, will close bids July 28 for construction of a \$60,000 tank house at university pumping station. Arthur Peabody is State architect.

J. W. Turner, proprietor of Turner's Garage, Elkhorn, Wis., will begin work Aug. 1 on a two-story automotive sales and maintenance building, 60 x 100 ft., at Delavan, Wis. Second story will be given over to service and repairs.

Gillette Rubber Co., 799 Wisconsin Avenue, Eau Claire, Wis., is at work on a four-story addition, 74 x 160 ft., costing about \$75,000 complete. General contract for designing and erecting has been placed with Hoeppner & Bartlett Co., 414 East Grand Avenue, Eau Claire.

Armstrong Foundry Co., 1530 Junction Avenue, Racine, Wis., manufacturer of gray iron castings, has accepted bid of Nelson & Co., 408 Janes Building, for construction of an addition, 70 x 80 ft. Architect is J. Mandor Matson, Racine.

Young Radiator Co., Racine, Wis., manufacturer of radiators, cooling systems and heating units, has received year's contract from Chicago Pneumatic Tool Co., New York, for manufacture of radiators used on latter company's portable compressors.

Pacific Coast

SAN FRANCISCO, July 5.—An expansion and improvement program is being arranged by Holly Sugar Corporation, Tracy, Cal., at its beet sugar mill, including one-story wing addition to cost about \$85,000, of which approximately one-half will be expended for equipment. Headquarters are at Colorado Springs, Colo.

East Bay Municipal District, 1924 Broadway, Oakland, Cal., will receive bids until Aug. 17 for hydraulic and electric power equipment for its Pardee power plant, Mokelumne River project. John H. Kimball is secretary.

Inglewood Union High School District, Inglewood, Cal., has authorized plans for a new high school group, including one-story manual arts building. Bond issue of \$400,000 has been approved. T. C. Kistner & Co., Architects Building, Los Angeles, are architects.

Marconi Mfg. Co., Seattle, care of Hancock & Lockman, Walker Building, architects, has completed plans for new two-story radio equipment manufacturing factory, 50 x 160 ft., to cost about \$55,000 with machinery.

Whitehouse & Price, Hutton Building, Spokane, Wash., architects, have completed plans for a multi-story automobile service, repair and garage building for City Ramp Garage, Inc., Hutton Building, to cost \$200,000 with equipment.

Board of School Trustees, Pomona, Cal., has plans for a new junior high school group, with one-story manual arts unit, 50 x 160 ft. A bond issue of \$300,000 has been arranged for project. T. C. Kistner & Co., Architects Building, Los Angeles, are architects.

City Council, Idaho Falls, Idaho, has been authorized to issue bonds for \$100,000 for extensions and improvements in municipal hydroelectric power plant and completion of power dam on Snake River.

C. W. McCall, 1404 Franklin Street, Oakland, Cal., architect, has completed plans for one-story automobile service, repair and garage building, to cost close to \$100,000 with equipment.

Kinney Iron Works, 2724 Santa Fe Avenue, Vernon, Los Angeles, has awarded general contract to J. C. Flick, Huntington Park, Cal., for a one-story shop unit.

Southern California Edison Co., Third Street and Broadway, Los Angeles, has filed plans for one-story automobile service, repair and garage building for company trucks, 75 x 185 ft., to cost about \$70,000 with equipment.

Associated Oil Co., 79 New Montgomery Street, San Francisco, has applied for permission to construct three new pipe lines from its properties in Potrero field to Rosecrans, and from latter point, another pipe line to Wilmington, Los Angeles, to cost more than \$350,000.

F. & F. Six Wheel Co., 220 East Market Street, Los Angeles, has been formed to manufacture six wheel frame extensions for trucks, particularly applicable to Ford models. Work is being done under contract and manufacturing is being concentrated at Los Angeles.

Carter Steel Products Co., 1934 South San Fernando Road, Glendale, Cal., has been formed to manufacture novelty steel buildings. Company has purchased plant at above address, which is in operation, and will purchase light structural steel, sheets, windows, doors and other building products.

Van Dorn Electric Tool Co., Cleveland, has established warehouse and service station at 525 East Tenth Street, Oakland, Cal., to supplement sales branches in Los Angeles, San Francisco and Seattle and service branches at Los Angeles, Oakland and Seattle. Complete stocks of Van Dorn and Van Norman products will be carried and shipments made to Pacific Coast points directly from new warehouse. Sales branches will be operated at 857 South San Pedro Street, Los Angeles; 75 Fremont Street, San Francisco, and 514 Virginia Street, Seattle, in charge of Waldo H. Bair, Harry W. White and Roy Wise respectively.

Eugene Luckey, Inc., Portland, Ore., manufacturer of piston rings, will remove factory and sales room to Broadway and Flanders Street.

Hooker Electrochemical Co. has plans for a \$1,000,000 plant at Tacoma, Wash., construction to start immediately. This will be a main branch of company headquarters which are at Niagara Falls, N. Y.

L. G. Bradfield Co., located in central manufacturing district, Los Angeles, is erecting an addition to its factory to increase floor space 50 per cent and double production. Approximately \$30,000 will be spent for land, equipment and building. A considerable quantity of machine tools will be purchased. William P. Neil Co., Inc., have general contract.

Canada

TORONTO, July 9.—Machine tool business for June showed improvement over that for May and, according to builders and dealers, was one of the best months this year. During the first week of July, however, sales fell off sharply and interest was confined mostly to inquiry. New business in prospect is of diversified character and covers practically all industrial activities. Building programs by industrial companies are numerous with many new plants under construction or in prospect.

Robert Mitchell Co., Montreal, has leased an iron foundry near its plant, belonging to Thomas Davidson estate, to relieve congestion in its foundry. Company manufactures architectural bronze and wrought iron, metal fittings and fixtures for railroad passenger cars.

Queenston Quarries, Ltd., Queenston, Ont., will start work soon on an addition, 60 x 100 ft., to cost \$40,000.

Gardner Construction Co., Ltd., 22 Cross Street, Welland, Ont., has been awarded contract for construction of a one-story addition, 60 x 160 ft., to plant at Crowland Township, Ont., for Page-Hersey Tubes, Ltd., Church Street, Toronto.

Church Ross Co., 901 Keefer Building, Montreal, has general contract for building a four-story factory for Congoleum Co. of Canada, Ltd., 1170 St. Patrick Street, Montreal, to cost \$100,000. Architects are Hutchison & Wood, 86 Notre Dame Street West.

Bulk tenders are being received by E. Bamber, Kerr Street, Oakville, Ont., until July 16 for erection of a one-story factory, 60 x 300 ft., for General Metal Devices, Ltd. R. Card, 142 Chester Avenue, Toronto, is architect.

Brigham & Woolrich, 201 Fifth Avenue East, Owen Sound, Ont., has been awarded contract for one-story addition, 50 x 100 ft., to plant of Empire Stove & Furnace Co., Third Avenue East.

Church Ross Co., Ltd., Montreal, has been awarded contract for erection of a \$250,000 addition to plant of the American Can Co., 2065 Jeanne d'Arc Street. Building will be five stories, 120 x 200 ft., of reinforced concrete.

Arco Paint Co., Cleveland, has purchased five acres on Weston Road, York Township, Ont., for erection of a three-story factory, 80 x 100 ft., to cost \$100,000. Plans call for completion by Oct. 1.

Western Canada

Plans and specifications for terminal facilities and cold storage plant of Pacific Coast Terminals, Ltd., New Westminster, B. C., have been filed. Plans

call for a four-story cold storage warehouse, power house, ice manufacturing plant, wharf and warehouse trackage and timber and general storage docks. Project will cost approximately \$2,000,000.

Knox Brothers, Montreal, are reported to be arranging for erection of a sawmill, dry kilns and wharf at North Vancouver, B. C.

Imperial Oil Ltd., Calgary, Alta., has started work on a two-story addition, 120 x 200 ft., to its plant and offices at 2066-9th Avenue West.

General Motors of Canada, Ltd., head office, Oshawa, Ont., has awarded contract to Smith Bros. & Wilson, Ltd., Eighth avenue and Ottawa Streets, Regina, Sask., for an assembling plant at Regina to cost \$1,000,000. Hutton & Souter, 6 James Street South, Hamilton, Ont., are architects.

Foreign

PLANs have been approved by Continuous Coal Carbonization, Ltd., London, for first unit of new plant at Erith, on Thames River, to be equipped for ultimate capacity of 1000 tons of coal per day to cost in excess of \$500,000 with equipment.

Municipal Government, Poznan (Posen), Poland, has arranged financing in an amount of about \$1,000,000, fund to be used for construction of municipal electric light and power plant, for which plans will soon be drawn. It is scheduled for completion next year. Gilbert Redfern, American assistant trade commissioner, Warsaw, Poland, has information.

A company is being organized by Abelardo Rodriguez, La Paz, Mexico (Lower California), Governor of northern district of Lower California, to take over and expand Moni Works, a division of Aeronautic Construction Department, Ministry of War, Mexico City, with plant to be operated in future under private ownership. New company will be capitalized at \$1,500,000 and purposes development of works to include motor construction, as

A Giant Electric Telpher at the Leipzig Trade Fair

ONE of the conspicuous exhibits in the technical division of the Leipzig Trade Fair, Leipzig, Germany, this year was a giant electric telpher in actual operation. It formed one of numerous outdoor exhibits of machinery. The track took roughly the form of a long ellipse, to illustrate the transporting of goods on straightways and around curves. The fall exposition, according to the Leipzig Trade Fair, Inc., New York, will be held from Aug. 26 to Sept. 1.

well as general aircraft parts and assembling divisions.

Company at Ravensbourne, Dunedin, New Zealand, plans early construction of a new mill for manufacture of superphosphates, to cost close to \$1,000,000 with equipment. Julian B. Foster, American trade commissioner, Wellington, New Zealand, has information.

Plans are under way by Liverpool Corporation, Liverpool, England, for new steam-operated electric power plant at River Mersey Docks of Docks Board, for which negotiations are under way for purchase. Plant will have initial capacity of 100,000 kw., and ultimate output of 400,000 kw., divided into 50,000 kw. units. It is estimated to cost about \$7,500,000 and will be built in cooperation with Central Electricity Board of British Electricity Commission, London, which will purchase practically entire output.

Fox Brothers International Corporation, 33 Rector Street, New York, has secured contract from Compania Transerea Espagnola, Seville, Spain, for the construction of a local airport for a Zeppelin line to be operated from such point to

Buenos Aires, Argentina. It will include hangars, repair and construction shops, terminal buildings and other structures, with estimated cost of \$5,000,000.

Colon Oil Corporation, care of Lee, Higginson & Co., 43 Exchange Place, New York, bankers, recently formed under Delaware laws by Royal Dutch-Shell Oil Syndicate and Carib Syndicate, Ltd., London, England, will take over and expand Colon Development Co., Ltd., operating oil properties in Maracaibo Basin, Venezuela. New company is disposing of bond issue of \$10,000,000 in United States, proceeds to be used primarily for construction of new pipe line, drilling of additional wells and installation of equipment. Gen. Avery D. Andrews is president, with headquarters at 65 Broadway, New York.

A machinery and engineering works at Chelmsford, England, has plans under way for an addition to cost close to \$500,000 with equipment. Information at office of Bureau of Domestic and Foreign Commerce, Washington, reference England No. 68676; also London, William L. Cooper, American commercial attaché.

of eight pages describing electric light reflector with a lens designed to change yellow light into the equivalent of daylight. These are made in a wide variety of forms, with standards, etc., for various applications.

Bearings.—Sumet Corporation, 1547 Fillmore Avenue, Buffalo. Folder devoted to bronze bearings, particularly for use in overhead electric traveling cranes.

Spraying Air Brush.—Paasche Air Brush Co., 1927 Diversey Parkway, Chicago. Folder illustrating and describing spray painting units, including both the air brush of pistol form and a gasoline or electric-driven unit to supply the pressure. It is portable and may be used indoors or outdoors as needed.

Ball Bearings for Machine Tools.—New Departure Mfg. Co., Bristol, Conn. Booklet of 20 pages illustrating and describing various types of ball bearings for machine tool use, including those on pulleys, change-speed gear boxes, worm gear reducers, bevel gears, spindles, both horizontal and vertical, etc. Methods of lubrication are shown.

Markets for American Industrial Machinery

The United States exported more than \$183,000,000 worth of strictly industrial machinery in 1927, a gain of approximately one-fifth over the previous year, and representing a volume greater than at any time since the post-war expansion of 1921, according to S. R. March, Industrial Machinery Division, Department of Commerce, Washington.

Canada, the United Kingdom and Mexico continued to be the largest markets for American machinery, in the order named. Cuba was the fourth best customer of the United States, but in spite of large purchases of sugar mill machinery the trade volume of 1924 and 1925 has not as yet been regained. The Venezuelan market for industrial machinery exports of the United States has steadily increased. Exports to Germany have grown in six years to more than ten times the \$566,000 volume of 1922. Shipments to Soviet Russia in Europe have increased from \$64,000 in 1922 to ten times that amount in 1927. Exports to both Argentina and Brazil reached the largest volume in six years.

Shipments to Chile declined sharply from the peak total of 1926, but nevertheless remained in excess of any other year since 1922. In view of the prolonged political and military disturbances in China, trade with that country naturally declined.

Germany to Trade Machinery for Tobacco

HAMBURG, GERMANY, June 23.—A contract has been signed by the Bulgarian Government and the Association of Agricultural Machinery Manufacturers in Germany, under which Bulgaria will receive \$1,100,000 worth of agricultural machinery in exchange for tobacco of the same value.

New Trade Publications

Ball Bearings.—McGill Metal Co., Valparaiso, Ind. loose leaf catalog of 40 pages, 8½ x 11 in., describing Schubert ball bearings of radial, angular contact and thrust types. A feature of these bearings is that they are equipped with bronze retainers. Comprehensive load capacity tables are included and data are given on magneto type bearings and extra light and narrow type bearings. Information relating to mounting and to lubrication is included and pages are devoted to the properties and some of the uses of McGill metal, a special aluminum bronze.

Pipe Threading and Cutting Machinery.—Landis Machine Co., Waynesboro, Pa. Catalog No. 31, 64 pages, 6 x 9 in. In addition descriptive material and specifications of pipe threading and cutting machines which range in size from 2 to 20 in. and are arranged for either belt or motor drive, data are given on single and double-head pipe and nipple threading machines, and on various sizes of the Geist roller pipe cutter. The Landis chaser, chaser holder and stationary pipe die heads are illustrated and described at length, as well as the company's standard, internally tripped and Lanco pipe and nipple threading die heads. Useful information includes a table of Briggs and Whitworth standard pipe threads and a table of cutting speeds for pipe.

Lubricating Systems.—Madison-Kipp Corporation, Madison, Wis. Booklet of 56 pages, 10 x 14 in., of reprints of recent advertisements of the company's fresh oil lubricating system. A large number of applications to oil, gas and steam engines is illustrated and briefly described, as well as use of the lubricators on turret lathes, chucking machines, planers, punch presses, steam hammers, woodworking and other machinery. Several pages are devoted to general and special data relating to the construction of the lubricators.

Die Cushions for Power Presses.—Marquette Tool & Mfg. Co., 1900 North Kilbourn Avenue, Chicago. Catalog No. 4, 151 pages, 6½ x 9½ in., bound in

boards. More than 20 types of pneumatic die cushions, designed for use in connection with presses of various types and for a variety of work, are described and illustrated. Specifications and lists of parts are given for each type, and actual installations and samples of work are pictured. Pneumatic toggle links, pressure control and other pneumatic devices are also described, and a section is devoted to the company's hydropneumatic die cushions. Constructional sketches of various types of dies, showing the application of the pneumatic cushions are reproduced, and several pages are devoted to useful information. The latter includes weight tables, data relating to the width of strips for staggered cuts, areas of drawn shells, blank diameters, pressures required for punching and shearing steel and brass plate, and the approximate clearance between the punch and die on the diameter.

Shovels, Cranes and Drag Lines.—Northwest Engineering Co., 28 East Jackson Boulevard, Chicago. A 40-page catalog describing machines made by this company, and giving details of features of design. It is well illustrated with operation views.

Drop Pit Table.—Watson-Stillman Co., 75 West Street, New York. Bulletin C-30 of 12 pages illustrates and describes an electric drop pit table for railroad shops and similar uses, operated through the medium of four screws. This is designed to take certain parts from under a locomotive or car and remove them for repair or replacement. The equipment is made with capacity up to 50 tons.

Multi-Stage Centrifugal Pumps.—Ingersoll-Rand Co., 11 Broadway, New York. Bulletin 7158 of 32 pages describes the Cameron type of multi-stage centrifugal pumps and gives a large number of installation views. There are also several sections and detail views, showing parts of the pump and describing its construction.

Artificial Daylight.—O. C. White Co., 15 Hermon Street, Worcester. Bulletin

THE IRON AGE

VOL. 122, No. 3

Interconnected Conveying System

Materials-Handling Methods of Marmon Motor Car Co.
in Producing Cars from Parts—Several
Types of Equipment Used

BY BURNHAM FINNEY*

CHARACTERISTIC of the automobile industry has been the pioneering spirit which has given impetus to the development of new manufacturing methods and to the creation of what, for lack of a better term, has been called mass production. Especially in the past few years has the intense competition among automobile makers accentuated the need for finding new ways and means of lowering production costs and at the same time attaining the highest possible efficiency. As a result, new achievements in this direction constantly attract the attention of industry in general.

Introduction of new models is a serious problem, often calling for the rearrangement of production lines so that the available space can be utilized to the best advantage. Such was the problem of the Marmon Motor Car Co., Indianapolis, when it decided to put on the market its new "68" straight-eight car, for it was confronted with the necessity of revamping its plant No. 2 for this purpose. By adopting certain methods previously used successfully, and by installing a complete system of materials-handling equipment, the company has been able to turn out completed automobiles at a satisfactory cost.

Following its policy adopted several years ago,

*Resident editor at Cincinnati for THE IRON AGE.

of eliminating stock rooms, the company has made provision in plant No. 2 for delivery of materials to points where they are needed in the assembly lines. Wide aisles afford opportunity for motor trucks to drive into the

factory and unload parts at convenient locations, while spur tracks from the main line of the Pennsylvania Railroad extend into the building at its southeastern end. The floor of the freight cars is level with the concrete floor of the factory, so that loading and unloading are facilitated. By means of this arrangement, automobile frames, for example, can be brought into the plant in freight cars, removed and stored near the beginning of the frame assembly line. However, if frames are to be delivered by motor truck, the trucks can be driven along an aisle to a point immediately adjacent to the frame assembly line.

Adhering to the policy instituted in the Marmon plant No. 3, the company has so placed stock bins in plant No. 2 that workmen can get what they want without going to a centralized stockroom. For instance, along the body upfit assembly line are storage bins containing materials for local use.

Four divisions of the plant are served by mechanical conveying equipment: the frame assembly line, the body upfit line, the machine shop and the chassis main

Coming Off the Body Upfit Conveyor, the Body Is Mounted on the Chassis by Means of an Overhead Crane Operating on a Monorail (G in plan, page 138). The lifting frame has special clamps to hold the body

assembly line. Supplementing these is an automatic continuous enameling oven in which fenders, side shields and small parts are enameled.

Consisting of a motor-driven belt conveyor approximately 160 ft. in length, the frame assembly line has several interesting features. Frames stored near the beginning of the line are placed immediately adjoining the conveyor in a pile six or seven frames high. They are lifted on to the conveyor by means of a special carrier suspended from a hand crane. The carrier has four hooks which fit under the frame and hold it firmly while it is being moved on to the conveyor, the frame being placed in a crosswise position. Under normal conditions the conveyor operates at a speed of 15 in. a minute for 100 cars a day. The frame goes through a spray booth while upside down, receiving a coat of lacquer.

At right angle to the frame assembly line is the chassis main assembly line. When the chassis reaches the latter it is upside down, but it is put in the proper position on the main assembly line by means of an automatic turnover device designed by the company. The main assembly line comprises two parallel belt conveyors arranged so that the wheels of the car rest on them. The conveyors move 35 in. a minute for a production schedule of 100 cars daily. The conveyors, the speed of which may be adjusted to meet production demands, make possible the progress of the chassis without moving the wheels of the cars.

Each chassis starting down this line reaches the end, 480 ft. distant, a finished automobile [480 ft. ÷ 35 in. a minute = 145 min., or 2 hr. 25 min.]. After the chassis leaves the turnover, the motor and the battery are set into position. A short distance farther along the line the body, coming off the body upfit conveyor, is mounted on the chassis by means of an overhead crane operating on a monorail. The monorail forms a rectangle the length of which runs for 50 ft. parallel to and directly over the main assembly line. Suspended from the crane is a lifting frame with special clamps to hold the body.

The body upfit conveyor feeding the main assembly line is approximately 150 ft. long and consists of two roller chain conveyors, paralleling each other, 3 ft. apart. Bodies are placed on metal holding devices, moving along the line in a crosswise position at a speed of 14 in. a minute for a

production schedule planned to make 100 cars daily.

Since the acid fumes from the battery room would tend to rust the metal parts if placed in close proximity, that room is located a considerable distance from the main assembly line. Batteries move from this point to the far side of the assembly line, where they are installed on the chassis by means of a gravity roller conveyor.

From the point where the body is mounted on the chassis, the car progresses steadily to the final inspection pit, where it leaves the conveyor. En route the fenders, hood, rims, lamps, hub caps and step plates are added and the four-wheel brakes are adjusted. After the car has been thoroughly inspected, it is driven by its own power from the pit, the left wheels passing over a "trip" in the track, which automatically lowers and raises a screen for the purpose of focusing the head lights.

In the machine shop, where the parts making up the motor are machined, and where the motor is assembled and tested ready for installation in the chassis as it moves along the main assembly line, practically all materials are handled mechanically. Crankcases are delivered by the (outside) maker to a storage yard just outside the machine shop and adjoining the normalizing ovens. All-metal trucks are loaded with crankcases, are moved into the ovens, to remain for a stated period, and then are pushed into the machine shop. Here they are unloaded near the shot blast booth, where the crankcases are cleaned preparatory to starting their journey down the crankcase line.

From the shot blast booth the crankcases are carried on a roller conveyor through all of the machining operations

Crankcase Conveyor Line (Below) Dividing into Two Parts to Reach Two Milling Machines for First Machining Operations (See D in plan)

Straight-Eight Engine (Above) Leaving the Assembly Line (the Parallel Bars in Right Foreground) for Block Test (See E in plan). Numerous test stands appear in the background. The motor moves to the block test by means of an overhead monorail conveyor with a special carrier attached

to the motor assembly line. After leaving the shot blast booth, they pass through a small spray booth, where they are given a sealing coat on the inside of the case. A few feet farther along the line the conveyor track divides into two parts, so that the crankcases can pass under two Ingersoll milling machines for the first machining operation. The division of the track at this point permits two crankcases to be milled at the same time, delay in the movement of material down the conveyor line being thus avoided.

After the crankcases have been milled, the two tracks are merged again into one for continued progress along the line. For some machining operations it is necessary to remove the crankcases from the conveyor by means of an overhead hoist, to place them in the proper position to be machined.

The crankcase conveyor line is paralleled by other lines along which parts going into the motor are trans-

Freight Car on Depressed Track (Above) Showing Material Being Unloaded to Frame Assembly Line. Floor of freight car is level with floor of building. (See A in plan)

Chassis Assembly Line Looking Toward the Spray Booth (C in plan). Frame conveyor operates at a speed of 15 in. a minute for a production schedule of 100 cars a day. Frames (upside down) are lifted on to the conveyor by means of a special carrier suspended from a hand crane

ported. For instance, bearing caps, connecting rods, fly-wheels and pistons have separate roller conveyors along which they progress to a point where the connecting rods and pistons are assembled.

At right angle to the crankcase line is the motor assembly conveyor line. Approximately 175 ft. in length, this line consists of an iron framework supporting two parallel iron bars located at a convenient working height. Small special holders, which are attached to each of the four corners of the motor, rest and slide on the bars, thus permitting the motor to be suspended between the bars. In this position the motor can easily be moved by hand down the assembly line. When the motor starts its journey down the line it is upside down; it is righted at the proper place by a turnover fixture devised by the company.

Reaching the end of the assembly line, the motor is lifted

by a special carrier depending from an overhead monorail and is moved to the motor block test. This part of the shop is served by an extensive monorail system installed by the Loudon Machinery Co., Fairfield, Iowa. After the block test has been completed, the motor is taken by monorail to the main assembly line, where it is lowered into position in the chassis.

Fenders, running boards, side shields and small parts are run through a burn-off oven near the mechanical enameling oven, where they are thoroughly cleaned by burning. They are removed to stands and sanded and then delivered to a small dust-proof room, where they are dipped in a primer coat. A conveyor carries them along, draining as they go, through a continuous oven, where the priming coat is baked on. At the end of the oven the operation is repeated with a coat of enamel, after which the parts are

Assembling the Marmon Car in Plant No. 2

LAYOUT of the Assembling Portion of the Marmon Plant, Showing Flow of Materials and Parts from Points of Receipt into the Finished Car, Ready to Drive Away Under Its Own Power. Letters A to H refer to photographs showing how the various items are handled. It will be noted that the engine is assembled at left and the chassis at upper right. The body strikes across the center and all come together in the main line running from top to bottom of drawing

At Beginning of Car Assembly Line, Showing the Chassis Turnover Fixture (B in plan) in the Left Foreground and the Flat Traveling Conveyors Which Make It Possible for the Chassis to Be Moved Along the Assembly Line Without Moving the Wheels

inspected and delivered to the assembly line. After once being put on the conveyor, the parts are untouched by workmen until they are completely enameled and ready for use. The continuous enameling conveyor is 195 ft. long and travels at a speed of 18 in. a minute for a production schedule of 100 cars a day.

In addition to the various handling arrangements already described, the company uses electric lift trucks rather extensively for moving stock about the plant. For example, lift platforms are taken by electric trucks to the doors of freight cars which are to be unloaded. Here workmen remove the material from the cars by hand and place it on the platforms. When the platforms are loaded to capacity, they are carried by electric truck to the points in the assembly lines where the material is needed.

The roller conveying system in the machine shop was

manufactured and installed by the Mathews Conveyor Co., Ellwood City, Pa. However, much of the mechanical handling equipment, especially along the assembly lines, was designed and installed by the Marmon company.

Study of the plan on the opposite page shows how well the entire series of assembling operations has been dovetailed into a completed whole. One entire section—the left side of drawing, and nearly half the total area—has been set aside for putting the engine together, and testing it as an assembled unit. It then passes to the main assembly line at almost the center of the picture.

Meantime two other operations, under way simultaneously with the first, have prepared the chassis to receive the engine and the body to be placed upon the chassis. In both cases the movement is from the right of the plan toward the left, the chassis progressing along the top and the body

Bodies on Conveyor (F in plan), Where Their Fitting Is Completed Before They Are Mounted on Chassis. The body up-fit conveyor consists of two roller chain conveyors paralleling each other, 3 ft. apart. Bodies move along this line at a speed of 14 in. a minute for a production schedule of 100 cars daily

End of Car Assembly Line Just Beyond the Inspection Pit, Showing at Extreme Left the "Trip" in the Track, Which Operates a Counter Device and Focuses the Screen for Headlights (See H in plan). This screen appears at right of illustration. From this point the car is driven under its own power to shipping dock

squarely across the middle. Speeds of conveyors are worked out to synchronize the various movements to such effect that there will be no waiting at any point along the line.

These speeds are task-setters for the men, whose motions fit in with those of the mechanical appliances in forming a completed car within an appointed time.

What Standards in Industry Mean; Some Limitations

THE May number of the *Annals* of the American Academy of Political and Social Science is given up completely to the subject of standardization in industry and what it means to manufacturer, distributor and consumer. There are 36 articles, each from an expert in some particular line of the work, and divided into four groups. Part I covers standardization programs in industry; part II, standardization programs of specific industries; part III, standardization programs outside of industry; part IV, standardization and the consumer. The latter includes the steps which are being taken by the Government to protect the consumer through certification of standard specifications.

In a foreword, Richard H. Lansburgh, professor of industry at the University of Pennsylvania, says, among other things: "That the development of standardization in industry has been one of the most significant phases of the new industrial management has come to be known to even those who have but a passing knowledge of modern industrial conditions. . . . That there are limitations to the extent of standardization is fully realized by all who have been associated in the work, and those articles which dwell on this phase should serve as a ready reference check on enthusiasms which carry a good cause to extremes."

One feature brought out in a discussion of simplification and standardization in Europe concerns British standardization. A considerable sum of money has been appropriated to have existing British standards translated into foreign languages. This has for its object the possibility of use of these standards by foreign purchasers, thus increasing the market for British goods.

One of the limitations on standardization is pointed out by K. H. Condit, editor *American Machinist*. It relates to the

early development stages of the automobile, 25 years ago. "Most of the designs were experimental and were subject to radical changes each year, and sometimes oftener. Any effort to standardize then would have resulted either in failure or in a retarding of development quite as bad."

Later on Mr. Condit says, regarding international standardization: "Size standardization is almost impossible because of variations in measuring units. The great bulk of the [world's] manufacturing is done in Great Britain and the United States, to English units, while the minor part is done in many other countries, to metric units. A little progress [toward standardization between the units] has been made with ball bearings and screw threads."

This standard size as between measuring units is brought out differently in another article devoted to filing equipment. Filing cards are now standardized in inches: 3 x 5, 4 x 6, 5 x 8, etc., in place of the metric system used in the early development of this phase of industrial control. Today the only metric cards in use, with few exceptions, in the United States are found in libraries or scientific institutions.

This question of filing equipment goes rather deeply into standards for steel filing cabinets and drawers. Standards are laid down for the various panels and dividing elements, both as to gage of steel and as to grade of sheets. A sample specification is given, with considerable discussion as to reasons for the adoption of each item.

Cross indexing in the rear of this 282-page volume occupies no less than 9 pages. This should be of great value to anyone consulting the volume, which is primarily one of reference.

Wear Testing of Various Metals

Steels and Bronzes Covered in Methods Detailed

By Research Men — Efforts to Make
Laboratory Simulate Service

SEVERAL papers presented before the thirty-first annual meeting of the American Society for Testing Materials at Atlantic City in the last week of June dealt with tests of metals or other materials, to determine their resistance to wear. Both steels and non-ferrous metals were included in the four papers, of which abstracts appear below.

Wear Testing of Various Types of Steels

IN this paper, which was presented by J. M. Blake, engineer of tests American Manganese Steel Co., Chicago Heights, Ill., apparatus was described which has been developed to test the resistance of metals to abrasion under so-called wet grinding conditions. In principle, the machine is an accurately controlled grinding machine in which all conditions as to abrasive, pressure, speed, time and moisture or other liquid content are under the operator's control.

It is possible to approximate any given set of practical requirements. The wear is measured by the amount of metal worn off in approximately 15,000 ft. of travel at a speed of 125 ft. a minute. A pressure of 50 lb. to the square inch is used on a testing face of approximately 3 sq. in. The wear thus determined is expressed as the ratio of wear loss compared with a standard (commercially pure iron) at 100. By varying the abrasive used it has been possible to develop alloys specifically adapted to particular field requirements.

How the Abrasive Is Held to Its Work

Pressure between specimen and abrading service can be adjusted from 0 to approximately 500 lb. to the square inch. The pressure can be set or read without stopping the machine. The specimen engages the abrasive coated copper surface at an angle of about 30 deg. This acute forward angle serves to funnel the powdered abrasive between the gliding surfaces. The abrasive is deeply indented into the soft copper ring which serves as the bond for holding and forcing the particles of abrasive across the surface of the specimen.

On the equipment described, which has a ring 4 ft. in diameter, over the periphery of which the specimen is run, the standard test is 1200 revolutions. This gives approximately 15,000 ft. of travel, as above. The amount of metal worn off during such a test may vary from 3 gm. for some exceptionally hard steels to 150 gm. or more for alloys with a high abrasion factor. This Fahrenwald abrasion factor against sand, for several well known materials together with several new very hard alloys, is as follows:

Standard specimen (commercially pure iron) ..	100
Merchant bar iron, annealed	92
White iron	88
Manganese steel	77
Tool steel, hardened	76
White iron, chilled	72
High-speed metal, hardened	57
Stellite (welded wearing face)	51
Amsco alloy No. 459 (welded wearing face) ...	31
Amsco alloy No. 459 (as cast)	10

Wearing Qualities of Tire Chains

TO study the wear-resisting properties of steel for automotive tire chains a wear test developed was described in a paper by W. H. Parker, research engineer American Chain Co., Bridgeport, Conn. Specimens may be of almost any shape, including chain links already formed. They are held at constant pressure against a rotating alundum grinding wheel of which the surface is kept continually dressed. Automatic record is obtained of the number of revolutions required to produce a given depth of wear.

As the service to which tire chains are subjected involves the relation between impact and wear resistance, a somewhat theoretical discussion is given of this relation as applied to the links of a tire cross chain. Some results of wear tests were reported. Comparison with service tests indicates that the laboratory test rates various materials in practically the same order as road tests, while giving a much greater distinction between them. The laboratory test furnishes a relatively quick means for comparing different materials and different heat treatments.

Relating Laboratory Tests to Road Tests

Making a comparison between a machine test and a service wear test in which the different materials were treated alike in each case, one material showed a loss in weight of 5 per cent in service and 14.4 per cent in the machine. A second material showed losses of 7.7 per cent and 19.6 per cent in service and machine. A third material showed 8.4 per cent and 26 per cent; a fourth, 8.6 per cent and 23.7 per cent; a fifth, 9.1 per cent and 27 per cent. Only in the cases of the third and fourth was the order of resistance varied as between the two kinds of tests.

As the relatively ideal conditions under which laboratory determinations are made do not obtain in service, it is somewhat difficult to check the results of the one with the other. For some materials certain other factors may have an influence upon the life of the cross chain, such as liability to failure under repeated impact or tendency of certain sections of the link to develop cracks under heat treatment. In general, however, it has been found that the correlated results of the laboratory tests give a reliable index of the service qualities of cross chains.

Wearing Tests of Manganese Steel

DEVELOPMENT of a test for the wearing properties of 12 per cent manganese steel was described in a paper by John Howe Hall, metallurgical engineer Taylor-Wharton Iron & Steel Co., High Bridge, N. J. It was endeavored to find a test which would give results comparable with service experience. A number of crude methods were abandoned after trial, usually because they were too slow or too clumsy or did not give a true indication of the wearing properties.

Finally it was concluded to adopt the method of crushing known amounts of hard stone in a small laboratory stone crusher, in which the jaws were made of the steels

to be tested. The loss in weight of the jaws was ascertained at regular intervals. More recently wear tests have been made in the Ansler and the Brinell abrasion machines. But it was found that these machines do not simulate the particular kind of wear which manganese steel successfully withstands in service: that is, abrasion associated with severe cold working, such as obtains with the pressure exerted by the crushing of hard material. Hence the tests went back to the tedious but reliable jaw crusher.

In the paper details are given of tests in such a crusher of manganese steel, plain carbon steel, nickel steel, chromium steel and nickel-chrome steel. It was found that manganese outwore carbon steel about 10 to 1. Chromium decreased the wear of the pearlitic steels very little, if at all, but nickel decreased that wear to a marked extent.

Considerable Work Needed for Dependable Results

Two types of crushers were used, one with fixed jaws and the other with moving jaws. They did not give exactly the same line-up of materials, so far as resistance to wear was concerned, but both showed the 12 per cent manganese steel far superior to any of the others tested. It was found that when the jaws were first put to work the wear was much more rapid than at a later period. This is attributed in all of the specimens to surface decarburization of the steel. In the case of the manganese steel, and perhaps in some of the others, it is attributed also to the fact that the surface later becomes work-hardened by the pressure of the stone being crushed, and then gives greater resistance.

For this reason no test is considered of any value whatever in which only a few hundred pounds of stone are crushed. It can easily happen that a steel which would give excellent results on extended tests wears rapidly at first on account of a decarburized skin. Another and an inferior steel, so treated as to be less decarburized at the surface, might at first appear to be better than the good steel whose surface was decarburized. It has been the practice in these tests to weigh the jaws after each 4000 lb. of stone crushed. The loss in weight in grams is recorded and the loss in grams per square inch of jaw surface to each 1000 lb. of stone crushed. No high degree of accuracy is claimed for the results, but they are regarded as a reliable indication.

Tests of Railroad Bearing Bronzes

RESULTS of tests of copper-tin-lead alloys, both chill-cast and sand-cast, were reported in a paper by H. J. French, senior metallurgist United States Bureau of Standards, Washington. These tests were made for wear and the alloys were tested under friction without lubrication at temperatures from 70 to 300 deg. Fahr., under friction with a lubricant at 70 deg. and under tension with single-blow impact and repeated pounding at temperatures from 70 to 600 deg.

Generally speaking, chill-cast bronzes were less resistant to wear and to notched-bar impact than sand-cast bronzes. They were, however, more resistant to pounding and tension.

Increase in the proportion of lead, particularly in the range between $\frac{1}{4}$ and 10 per cent, improved the wearing properties but lowered the resistance to pounding, impact and tension. Increase in the tin component was found to improve all these properties. Increase in the temperature at which the test was run generally decreased resistance to tension, impact, pounding and wear. The changes from this cause were most marked between 350 and 600 deg.

High-Lead Bronzes Without Lubrication

In practical applications there are decided advantages in the high-lead bronzes for service where lubrication can-

not be maintained. These bronzes containing about 12 to 25 per cent of lead did not wear so rapidly as the low-lead bronzes, nor assume so rough a surface, in tests without lubricant. If wear is the chief factor to be considered, and an approximately constant ratio is maintained between copper and tin, variations of lead within the range of 12 to 25 per cent seem unimportant.

Where it is important also to have a high resistance to pounding and a high static strength at both atmospheric and elevated temperatures, lead may advantageously be kept near the low limit of the range mentioned. Its strength and toughness to notched tests decrease as the proportion of lead increases. These differences, however, are relatively small, and for many purposes bronzes with from 15 to 25 per cent of lead are practically interchangeable.

When mechanical properties become of primary importance, and lubrication can be maintained so that wear is of secondary importance, there are advantages in low lead and high tin. Both these features favor high strength and resistance to pounding.

Tests Indicative, When Not Fully Conclusive

No one selected laboratory test yielded information adequate by itself for general comparisons. Each test, however, contributed valuable information in developing the characteristics of the different bronzes. In alloys, with practically constant ratio of copper to lead, an increase in tin from 0.7 to about 5 per cent resulted in a marked improvement in wearing properties in tests without lubricant. Further increase in the tin, however, up to 10 per cent did not materially modify the wearing properties, but resulted in improved tensile strength and resistance to pounding.

It has been shown that reproducible wear tests can be obtained in the laboratory. When combined with suitable mechanical tests, the results give comparisons consistent with practical experience.

Accuracy of Analysis for Oxygen and Hydrogen in Steel

In recent years much work has been done both here and abroad on the accurate determination of gas in metal. In order to compare the methods used in different steel-producing countries, the United States Bureau of Standards prepared a uniform sample of ingot iron, and distributed portions to various investigators. The iron contained 0.04 carbon, 0.03 manganese, 0.02 sulphur and 0.006 silicon. Analysis for gases gave the following results:

	Per Cent	
	Oxygen	Hydrogen
United States Bureau of Standards.....	0.058	0.0006
Institut für Eisenhüttenkunde.....	0.059	0.0008
University of Sheffield.....	0.051	

The first two laboratories use a vacuum fusion method, melting in a graphite crucible contained in a high frequency furnace. The American method weighs the evolved gases, while the German method measures their volume. Hydrogen reduction of a solid sample (to which is added an anti-mony-tin alloy) is used at Sheffield.

It may be concluded that the three methods are of the same order of accuracy, and give comparable results when carefully performed by skilled analysts.

Industrial Standards No. 206 and 212 of the Bureau of Foreign and Domestic Commerce have been prepared in Portuguese text, and are on sale by the Superintendent of Documents, Washington, for 5c. each. These are respectively translations of American Society for Testing Materials standard specifications for carbon steel locomotive forgings, and for carbon steel and alloy steel forgings for general purposes.

Building Industrial Stock Values

Prices at Which the Return Is Only That of a Good Bond Need
Not Be Called High If Management's Policy
Insures Continued Success

BY STERLING H. BUNNELL*

WHEN, as at the present time, the common stocks of large, well-managed industrials reach prices such that the rate of return on the investment is no more than bond interest, it is commonly said that the prices of these stocks are too high. This may be so, in the sense that when such a belief is generally held, slackening of demand is easily possible, and prices consequently may fall. The feeling is general among old and experienced investors, who gained their knowledge by owning and trading in Government and public utility securities, that industrial stocks are peculiarly hazardous investments, and that common stocks in particular should be bought only by speculators and then only on a basis of large dividend return.

Stocks and Bonds Hang Together

THIS reasoning is based on the idea that bonds and such preferred stocks as are secured by fixed assets can somehow be considered safe in any event against interruption of interest and loss of principal value, so that the rate of income paid, though low, is permanently assured. Bonds are frequently backed by mortgages on real estate, and the regular payment of interest is the first charge against earnings. But it is important to remember that, when a business ceases to earn a profit, the payment of interest must necessarily be suspended, and that it is not easy to liquidate the shrinking assets of an unprofitable concern so as to protect the bondholders' principal. In such an event, stockholders and bondholders alike lose their income, and the latter are only a degree less likely than the former to find their principal also lacking.

Only in the case of indispensable industries, like main-line railroads, is it generally possible for bondholders to exert their rights of foreclosure without fatal consequences or wiping out much of the value of the property. Industrials are combinations of plant, inventory and operating organization which can survive only if kept complete and in working order. The owners of a class of securities guaranteed by a mortgage on a part of such an inseparable combination hold Shylock's bond, which if collected would destroy the whole organization. Wise and upright judges have often intervened to prevent foreclosures likely to be

of little advantage to the bondholder and disastrous to the other interests concerned.

Every Form of Security Should Yield a Good Return

MANIFESTLY, successful operation of the corporation, so that a liberal percentage of profit is earned on the entire invested capital, is the only real assurance of security for the bonds, as well as for the stock. If the business earns just enough for bond interest and no more, the bonds cannot be given a high rating. If earnings just cover bond interest and stock dividends, neither bonds nor stock have an assured future; for well-equipped, successful industrials frequently are "depleting assets," just like mines, and productive efficiency and marketing methods are allowed to deteriorate with time, until only an idle factory adapted for making an unwanted product is left to be liquidated at its scrap value.

Depreciation tends to decrease the productive efficiency of plant and equipment, and obsolescence may even destroy the value of organization, product and business as well. If industrials are not to have, like mines, a limited term of useful existence, their life and energy must be continually renewed by methods of progressive development. Well-managed industrials ought not therefore to be expected to pay out substantially the whole of their earnings, by granting to their common stocks dividend rates two or three times the rate of income customarily paid on bonds.

Right Handling of Surplus

FROM the policy of paying a moderate regular dividend on the common stock and reserving a considerable part of the total net profit undistributed there results an accounting surplus which, if properly employed, will provide effective security for stocks and bonds alike. The scope and degree of security afforded depends, however, on the way in which the accumulated surplus is utilized; for surplus profits are not usually held in the form of cash or cash equivalents. This surplus may be invested in increases to the stock of materials on hand or work in progress, which may signify either its useful employment in increased business to earn additional profit, or its useless locking up in an idle excess of goods which better management would be able

*Consulting engineer, New York.

MR. BUNNELL elaborates an idea that has had more and more attention in financial circles, and one that is giving a new investment standing to common stocks of industrial companies. He points out that well-equipped industrials may be "depleting assets," as mines are and cites with approval examples of the policy of treating common stocks like preferred, maintaining moderate regular dividends with the highest assurance of being able to continue them because of the wise use of surplus profits in development

to move and turn into cash. Again, surplus may be invested in additions to plant and equipment, capable (or incapable) of earning profit in proportion to the investment. As money cannot be "tagged" to locate the particular destination of each particular dollar, the accumulated surplus of past undivided profits, however invested in the business, may be considered to be just as, and no more, efficiently used in earning profits as the rest of the invested funds.

By investing it in the intangible asset of industrial development work, surplus may be even more effective in promoting the continuance of steady earnings. Industrials can be permanently successful only through an unceasing process of growth. Better methods and results, the discovery or adaptation of new products, and most of all, ever-increasing effectiveness of personnel, are required to cope with new conditions as and when they occur. Every function of industrial engineering is required in the constant endeavor to maintain and improve the operating efficiency of the large industrials. Research and invention are constantly employed to anticipate future marketing requirements and prepare to supply them. Selecting, training, retaining, insuring and satisfactorily paying the workers, superintendents and managing heads of the plants involve the maintenance of personnel department organization on a liberal scale of expenditure. All this development work looks toward insuring future success, and so is properly provided for by appropriations from the undivided surplus profit of previous years; but if treated as an element of present cost, the net amount for dividends would remain the same.

Function of Depreciation Reserves

DEPRECIATION reserves also, set aside by factory accountants as an item of operating expense so as to be included in cost accounting figures, can and should be utilized to strengthen the future position of the securities. As the depreciation charges do not represent actual expenditure, depreciation reserves, like surplus, usually offset investments in operating assets of inventory or accounts receivable, or additions to plant equipment which are not regarded as replacements or mere betterments. In modern, progressive industrials, plant and equipment are constantly being improved, so that the depreciation of that which is in use is continually balanced by the addition of entirely new equipment. By following this practice, these industrials always have plants so up to date that new money could not possibly construct more efficient ones. It would, of course, be possible to treat an industrial as a depleting asset, and so to invest the depreciation reserve in securities to form a sinking fund to reimburse the owners of the plant and wind up the business at a fixed date. But self-extinction is not the contemplated purpose of industrials generally. There need be no fixed span of corporation existence, if life and activity are constantly renewed by intelligent use of a portion of the earnings in development.

The Right Building Up of Security Values

IN the last twenty years a great corporation, which started with hugely watered stock, has steadily built up its effective investment until its securities represent a value far above par, although the rate of return on the market value is little more than current interest. Its plants, with respect to productive efficiency, are equal to the best. Another large corporation, with an output once classified as a luxury, with a few thousand possible purchasers among the wealthy small fraction of the population, has constantly developed product and methods of construction until the wildest assumptions of former enthusiasts have been surpassed by the cold facts of its operations. Another, holding fast to the rarely adopted principle of one unchanged design through many years, was all the time preparing by unadvertised development and the accumulation of huge reserves so that when the market for the standard design should become surfeited, a complete new design should be ready for

prompt production. This was done at the proper moment without the slightest disturbance to the financial security of the corporation, and production and distribution of the new product proceeded on the previous enormous schedule. Many other American industrials might also be cited as examples of the success of the policy of treating common stocks like preferred securities, by maintaining moderate regular dividends with the highest assurance of continued ability to pay them, because of the wise use of surplus profits in development.

Surplus held in reserve by investment in current assets or income-paying securities is available for maintaining dividends in periods of earnings below average; and when such a reserve is provided for this purpose, common stock may be expected to pay an income quite as steady as preferred stock or bonds. But as a reserve cannot be inexhaustible, the important thing is to maintain an average rate of income sufficient for progressive renewal of the life and usefulness of the industrial, in addition to a reasonable rate of return on the invested capital used in the business.

Stock Values and Purchasing Power of Money

IT should be remembered that great changes in the purchasing power of money have taken place over a long period of years, and on the average the movement has gone a long way in the direction of reducing the value of the money unit. Owners of bonds and debentures have found that principal and fixed income alike have become less valuable in purchasing power, while standards of living have increased the demands on personal income. The owner of common stock possesses a fractional share in the value of the business, while the owner of bonds or debentures possesses only the equivalent of a certain number of dollars. The holder of common shares may reasonably expect that the prices of the securities will rise as affected by a general decrease in the purchasing power of money, and he may well prefer that accumulated surplus be used to develop further earning power, rather than held as a fund at interest and nothing else.

The policy of forward development, adopted by a large proportion of our industrials, has resulted in large increases in the market values of their shares. The common stocks of corporations so managed, paying steady, low rates of dividends from comparatively large surplus earnings, sometimes become known as "rich men's stocks," because they are bought and held by the wise and far-seeing investors who are generally found in the wealthy class, wherever they may have started in the process of accumulation of their savings. To these men, the steady increase of principal value is preferable to the receipt of high dividends which are uncertain of continuation, in the event of any severe disturbance to the accustomed routine of the business of the corporation.

Stock prices on the basis of returns little greater than for good bonds are not necessarily too high; certainly they are not to be so regarded if the shares represent participation in the assets of corporations which are managed so intelligently that permanently successful operation is virtually certain.

Notes on Molding Sand

Bulletin 266 of the U. S. Bureau of Mines ("Technology and Uses of Silica and Sand," by W. M. Weigel), includes a brief account of the properties of molding sand, a list of its principal sources, and a description of the quarrying, grading and washing methods used. Numerous footnotes referring to special writings on different phases of the subject are included. Other varieties of quartz used in the metal industries for furnace fettling, flux, grinding and polishing are given similar treatment. The bulletin may be secured from the Superintendent of Documents, Washington, for 40c.

Multiple Spot Welder for Making Fireproof Doors

A CORRUGATED reinforcing sheet is joined to an outside cover sheet in a number of places. This machine has 17 pairs of welding electrodes and nine transformers, to ensure adequate current to weld each spot. Sheets are gripped by feed rollers and driven forward in steps by a Geneva drive; at each halt the electrodes are lowered by cam motion, current is switched on, and a row of spots is welded simultaneously. A second set of driven rollers discharges the finished work. Capacity, 64 operations per minute, each making up to 17 welds, or 1088 welds per minute. (Agnew Electric Welder Co., Milford, Mich.)

Welder for Side Seams on Steel Barrels

BENT sheets, up to No. 16 gage and 36 in. long, are placed on the lower horn and held down by magnetic clamps. The traveling roller die then moves over the seam at 20 ft. per min. Uniform current, notwithstanding the variable location of the roller die, is secured automatically by patented secondary lead construction and auxiliary choke. Heat is varied to conform to different thicknesses of metal and surface conditions by five transformer taps, change in roller speed (driven by rack and pinion through a Reeves variable speed drive), and change in tension of the pressure spring. Lower welding die is a $\frac{1}{2}$ -in. hard drawn copper bar, which can be filed and adjusted without removal. Roller die can be removed for dressing by loosening six cap screws. Dressing is necessary once a day, or after 3000 ft. of welds. (Thomson Electric Welding Co., Lynn, Mass.)

* * *

Machine for Making Railroad Ties Out of Scrap Rails

TIE plates are adjusted to exact position by jig and pneumatic clamp, and angle bars are held at ends with spring toggle clamps. Entire jig is rotated 45 deg. forward, and the far edges of the tie plates are welded to the rail tops by the two automatic heads; they are then rotated backward and the near edges are welded. The angle bars are welded on by hand-operated arc. Capacity, one tie every 5 min., using two workmen, a 1500-amp. motor-generator set with four welding circuits, and approach and delivery conveyors. (General Electric Co., Schenectady, N. Y.)

Passes for Hot-Metal Rolling

Calculations for Reduction of Height and of Area, Combined with Increase in Width, of Section Produced

BY H. A. SLATTENGREN*

IT is the purpose of hot rolling, generally, to reduce the cross-sectional area of the ingot or billet, and also in most cases at the same time to break up the crystalline structure of the ingot or billet and to refine the grain—in other words, “to make the metal.” This can be accomplished by means of various forms of passes, the choice depending upon how fast the metal can be worked. This consideration includes the size of the ingot or billet and the characteristics of the particular metal, and also upon what shape of product is desired.

We shall here discuss mainly the shapes and sizes of the various grooves which make up the passes used in hot rolling, and what relation they bear to each other. The ratio of reduction in height, and resulting reduction of area, is a certain measure of the efficiency of a pass, and this we shall use.

Material, size and speed of the rolls have certain and definite influences upon the behavior of the metal in the various forms of passes, and must be taken into consideration for accurate results. The larger roll forms the metal more gradually and with less shock, other things being equal, but tends to increase the spread (sideways), while an increase of speed increases the stretch (forward), which is in favor of efficiency.

However, the above effects are generally small enough to be within the limits of the adjustment provided by the space between the rolls, which should always be made as small as possible, consistent with the economical life of the pass. This life depends upon the amount of metal that can be passed through it before the grooves are worn so much that the rolls touch or “ride,” and cause the product to become oversize for subsequent passes.

Of course, the temperature of the ingot or billet generally determines the softness of the metal, and this is the main point of consideration in designing grooves. The comparative plasticity of the metals at the rolling temperatures, and not their hardness or other physical properties when cold, determines the relative sizes of the passes. For instance, a high-cobalt magnet steel at 2100 deg. Fahr. may be just as soft as pure iron at 1000 deg. Fahr., and would accordingly behave similarly in identical passes.

Shapes of Grooves

Rectangle into Rectangle—Plain Rolls

IF a 1-in. square of some metal at the right rolling temperature is passed between plain rolls set to give a reduction in height of 50 per cent, the height of the produced rectangle with rounded ends will be 0.5 in. The displaced area will be, of course, the same; some of this will spread sideways and some will stretch forward and disappear from the cross-sectional area. As this disappearance of area will be equal to the difference between the area of the original square and that of the product, it can be more or less readily determined by experiment, about which more later. The percentage of reduction of area is found from the area which stretches forward, divided by the original area.

*315 Herrick Road, Riverside, Ill.

Let Rh equal the ratio of reduction in height; Ra , the ratio of reduction of area; W_o , the width of the original; and W_p , the width of the product. Then the general formulas for rectangle into rectangle, through plain rolls, are:

$$W_p = \frac{(1-Ra) W_o}{(1-Rh)} \dots (1) \text{ and } Ra = 1 - \frac{(1-Rh) W_p}{W_o} \dots (2)$$

It can be readily seen that W_p increases with W_o and Rh , but of course decreases as Ra increases. Similarly, Ra increases with W_o and Rh , but decreases as W_p increases. As an example, let us say that Rh is 40 per cent; Ra is 20 per cent and that W_o is equal to 3 in. Then, substituting in equation (1), we have:

$$W_p = \frac{(1-0.2) \times 3}{(1-0.4)} = \frac{0.8 \times 3}{0.6} = \frac{2.4}{0.6} = 4 \text{ in.}$$

If Ra is not known, by using W_p as above in equation (2) we get:

$$Ra = 1 - \frac{(1-0.4) \times 4}{3} = 1 - \frac{0.6 \times 4}{3} = 1 - \frac{2.4}{3} = 1 - 0.8 = 0.2 = 20 \text{ per cent}$$

This holds good very closely for any rectangle through plain rolls, after making a small allowance for the convex sides of the product, which is a comparatively easy matter to do.

Square Into Oval (Ellipse)

Pass a 1-in. square into an oval pass 0.5 in. high, which makes Rh equal to 50 per cent. The displaced area in this case will be somewhat more than 0.5 square inch. Because of the shape of an ellipse, the stretch will be more than it is for plain rolls, if the other factors are equal. It is well to note that the oval groove is always cut into the roll with a round tool which makes its outline an arc of a circle, but the discrepancy from that of an ellipse is so slight as to be negligible for our purpose. The area of an ellipse is equal to 3.1416 times the product of its half-axes.

If we again let W_p equal the width of the oval, the other symbols remaining the same, we get:

$$W_p = \frac{(1-Ra) W_o}{0.7854 (1-Rh)} \dots (3) \text{ and}$$

$$Ra = 1 - \frac{(1-Rh) \times 0.7854 W_p}{W_o} \dots (4)$$

Oval into Square or Diamond (Rhombus), with Major Axis of Oval Coinciding with Diagonal of Square or Diamond

$$W_p = \frac{(1-Ra) \times 1.5708 W_o}{1-Rh} \dots (5) \text{ and}$$

$$Ra = 1 - \frac{(1-Rh) W_p}{1.5708 W_o} \dots (6)$$

Side of square equals 0.70711 W_p ; and the area of a diamond or rhombus equals one-half of the product of its diagonals.

Square into Diamond—Side of Square Parallel to Diagonal of Diamond

$$W_p = \frac{(1-Ra) \times 2 W_o}{(1-Rh)} \dots (7) \text{ and}$$

$$Ra = 1 - \frac{(1-Rh) W_p}{2 W_o} \dots (8)$$

Diamond into Diamond—Diagonals Coinciding

$$Wp = \frac{(1-Ra) Wo}{(1-Rh)} \dots\dots(9) \quad \text{and}$$

$$Ra = 1 - \frac{(1-Rh) Wp}{Wo} \dots\dots(10)$$

Oval into Round

$$\text{Diameter of Round} = \frac{(1-Ra) \times 0.7854 Wo}{(1-Rh) \times 0.7854} \dots\dots(11) \quad \text{and}$$

$$Ra = 1 - \frac{(1-Rh) D}{Wo} \dots\dots(12)$$

Diameter of round—*D*—here corresponds to *Wp* in above equations.

Essential Information

WHEN designing a pass it is first of all necessary to decide upon the amount of *Rh* desired. This is governed by (1) the strength of the rolls; (2) the gripping angle, which is usually about 30 deg. from the vertical axis of the roll; and also (3) by the amount of reduction which the particular metal will endure without damage. Metal in the ingot form generally requires careful and easy rolling until its structure is sufficiently refined for the higher reductions. After this, reductions in height up to 50 per cent may be used with safety. It is in the interest of efficiency and economy, of course, to "hit the work" just as hard as it will stand, because, as shown by above equations, *Ra* always increases with *Rh* if other things are equal.

We may decide to use the same *Rh* throughout. But if we desire to keep the ratio of width to thickness of the oval more or less uniform, it will be necessary to decrease *Rh* as the billet gets smaller and cooler—in other words, when the spread sideways increases. It seems to be an invariable rule that the harder the metal is, at time of rolling, the more it spreads sideways, and vice-versa.

For convenience in illustrating, let us assume *Rh* to be 50 per cent throughout. Theoretically, *Ra* does not vary with the size of billet under the same *Rh* and shape of pass. But it does in practice, due to differences in rate of cooling and to the fact that the size of rolls is not changed proportionately.

Determining *Ra* and *Wp*

To proceed, we get sample lengths of the metal to be rolled in the following sizes of squares: 0.25 in., 0.5 in., 1 in., 2 in., 3 in., 4 in. and as many more as required, depending upon the sizes to be rolled. These are passed at an *Rh* of 50 per cent (as decided upon above) between plain rolls of a material, size and speed corresponding to what the actual rolling conditions will be.

From the round-ended rectangles produced, it is easy to compute the amount of *Ra* for the different sizes. They may be plotted on suitable cross-section paper, so that the *Ra* for intermediate sizes may be found from the curve. This done, *Wp* may be computed also for any size of rectangle into rectangle, and a curve again plotted for convenience, if desired, which may be checked by scaling the width of the rectangles rolled as above.

We know now the *Ra* and *Wp* for any size, within the range, of rectangle into rectangle for the metal in question. Let us compare the equations from above:

$$Wp = \frac{(1-Ra) Wo}{(1-Rh)} \dots\dots(1) \quad \text{and} \quad Ra = 1 -$$

$$\frac{(1-Rh) Wp}{Wo} \dots\dots(2) \quad \text{Rectangle into Rectangle.}$$

$$Wp = \frac{(1-Ra) Wo}{0.7854 (1-Rh)} \dots\dots(3) \quad \text{and} \quad Ra = 1 -$$

$$\frac{(1-Rh) \times 0.7854 Wp}{Wo} \dots\dots(4) \quad \text{Square into Oval.}$$

$$Wp = \frac{(1-Ra) \times 1.5708 Wo}{(1-Rh)} \dots\dots(5) \quad \text{and} \quad Ra = 1 -$$

$$\frac{(1-Rh) Wp}{1.5708 Wo} \dots\dots(6) \quad \text{Oval into Square or Diamond.}$$

$$Wp = \frac{(1-Ra) \times 2Wo}{(1-Rh)} \dots\dots(7) \quad \text{and} \quad Ra = 1 -$$

$$\frac{(1-Rh) Wp}{2 Wo} \dots\dots(8) \quad \text{Square into Diamond}$$

$$Wp = \frac{(1-Ra) Wo}{(1-Rh)} \dots\dots(9) \quad \text{and} \quad Ra = 1 -$$

$$\frac{(1-Rh) Wp}{Wo} \dots\dots(10) \quad \text{Diamond into Diamond.}$$

$$\text{Diameter of Round} = \frac{(1-Ra) Wo}{(1-Rh)} \dots\dots(11) \quad \text{and} \quad Ra = 1 -$$

$$\frac{(1-Rh) D}{Wo} \dots\dots(12) \quad \text{Oval into Round.}$$

Taking equation (1) as a basis for comparisons, it is

seen that the *Wp* for equation (3) is $\frac{1}{0.7854}$ or 1.273 times

the size of *Wp* for equation (1). Similarly, *Wp* in (5) is 1.5708 times the *Wp* in (1); the *Wp* in (7) is twice that of *Wp* in (1). The *Wp* in both (9) and (11) are the same as *Wp* in (1). The above is true only when *Rh*, *Ra* and *Wo* are the same in all cases, an unlikely condition, so the comparison is cited only for general information.

However, with the *Ra* it is possible to draw a considerably more definite relation between the different shapes of passes. For instance, it is plain that the *Ra* in equation (4) is larger than *Ra* in (2) for the same *Rh* and *Wo*. However, the numerical relation is not so simple to arrive at. For instance, if we divide (4) by (2), we get:

$$\frac{(1-0.7854) Wp}{(1-Wp)} = \frac{0.2146 Wp}{(1-Wp)}$$

This for our practical purpose does not mean so much. But it is possible to arrive at a comparative value by means of a direct example, as follows: Let *Rh* equal 50 per cent, *Wo* equal 1 and *Wp* equal 1.5 in equation (2). Substituting, we get:

$$Ra = 1 - \frac{(1-0.5) \times 1.5}{1} = 1 - (0.5 \times 1.5) = 1 - 0.75 = 0.25 = 25 \text{ per cent.}$$

For the same values in equation (4):

$$Ra = 1 - \frac{(1-0.5) \times 1.5 \times 0.7854}{1} = 1 - (0.5 \times 1.178) = 1 - 0.589 = 0.411 = 41.1 \text{ per cent.}$$

It is both interesting and instructive to draw comparisons between *Wp* and *Ra* for the different equations. But when we try to arrive at a direct relation, we find them so cumbersome that they have little practical value to roll pass designers. Several attempts have been made to make graphical comparisons and to evolve formulas, and with some success. The following is an equation which is supposed to apply only to steel, but will hold good for any metal with the same softness and characteristics as steel at the rolling temperature. It is of European origin, I believe:

$$B = 1.93C - 0.465H,$$

where *B* equals the width of the oval; *C* equals the side of square and *H* equals the height of the oval, which must be assumed according to the amount of reduction desired. A formula is not necessary to get the dimensions of the new square, as these can be determined by the ratio of reduction. There is little danger that the square will become over-filled, but if the smallest possible square is used, it is safer to make the angles of the square grooves from 91 deg. to 94 deg., to prevent forming a seam along the bar.

A process of manufacturing chromium plate has been placed on a commercial basis by the Apollo Metal Works, La Salle, Ill. It is offered as Apollo Chrome, "in sheets available for immediate fabrication without plating."

Cupola Operations Are Changing

Cooling of Reduction Zone Expected to Improve Thermal Economy—
Desulphurizing by Alkaline Slags

IMPROVEMENTS in cupola practice, principally of a thermotechnical nature, are attained by replacing coke with other fuels, chiefly in liquid or powdered form, by cutting down the formation of carbon monoxide in the reduction zone by a secondary air combustion of this gas, and by heating the air blast. Metallurgical improvements which are sought in the operation of cupolas are directed toward a reduction in the accumulation of sulphur and the production of a high-grade low-carbon and highly superheated cast iron.

The replacement of coke by other solid, liquid or gaseous fuels does not offer any advantage either from a technical or from an economical point of view. On the other hand, satisfactory operating results have been attained by the use of auxiliary oil firing, which, however, is uneconomical because of the high price of fuel oil. Similar advantages have been obtained with auxiliary pulverized coal firing, such as has been employed since 1921 at the Babcock works in Oberhausen.

Effect of Cooling Reduction Zone

The problem of diminishing the formation of carbon monoxide in the reduction zone, which is extremely detrimental to the thermal economy of the cupola, led to the introduction of a secondary air supply, but without obtaining satisfactory results. On the other hand, the method of Corsalli, which consists of making the coke more difficult to burn by drenching it with slacked lime, seems to offer some advantages. A question of great interest, from the theoretical as well as from the practical point of view, is whether it is possible to effect any physical or chemical reactions through a cooling of the reduction zone, which will make for thermal economy in operating the cupola. Attempts have been made to bring about such a cooling through the blowing in of cooled waste gases by a spray of steam or of water, or by strongly dampening the coke charges.

Water Spray Lowers Coke Consumption

The introduction of a water spray is favored by the Vulkan-Feuerungs A.G. in Cologne, which is said to have brought about a considerable reduction in coke charge consumption in the case of cupolas for continuous operation. After it had become evident that combustion of the carbon monoxide in the reduction zone by introducing a secondary air supply was not practicable, Greiner and Erpf in 1885 attempted, with good results, to bring about such combustion in the preheating zone of the cupola. The method of Greiner and Erpf has worked well but has required extremely high furnaces, which are seldom practicable on account of the lack of space in foundry buildings. The Poumay cupola, which originated in Belgium, is an improvement on this type. Data available on the operating results, however, do not warrant a conclusive opinion on the merits of the process.

Schuermann Cupola Passing Out

The most interesting cupola of special design is the Schuermann furnace, which made its appearance in 1922. [THE IRON AGE, Oct. 19, 1922, and Nov. 22, 1923.] In this type, part of the combustion gases is taken directly from the combustion zone and the reduction zone respectively and utilized for the heating of the air blast by means of

air heaters. The majority of the Schuermann cupolas that were in operation from 1922 to 1925 had been erected in plants which were cramped for space, and did not come up to expectations. In isolated instances, it is said, they have given a good account of themselves. In every case, however, these cupolas permit the use of cheaper grades of metal and a certain saving in coke; neither of these advantages is sufficiently important as yet to warrant the additional expense of this furnace equipment in the smaller foundries. The Schuermann cupola at the outset, before a familiarity with its construction had been acquired, was largely overestimated. At the present time, when it is possible to obtain excellent standard equipment and to operate it successfully, the Schuermann cupola is no longer seriously considered.

Alkaline Slags Are Strong Desulphurizers

Walter has focussed attention on the strong desulphurizing action of pure alkaline slags. The Walter desulphurizing method was at first carried out in crane pots or in special desulphurizing hearths. However, it was difficult and inconvenient, and at times even impossible, to desulphurize in this manner. Later, however, it was found possible, first to separate the fluid cast iron from its acid fusion slag upon its discharge from the cupola, and then to desulphurize it in the forehearth by means of a pure alkaline slag. Of the different designs of equipment used to make such a separation of the cast iron and the slag, those of Luyken, von Rein and of the Freier Grunder Eisen und Metallwerken deserve especial attention.

Characteristics of High-Test Iron

The endeavor to produce a so-called high-test cast iron in the cupola is of especial interest. The characteristics of this product are a low-carbon content and a fine and uniform distribution of the graphite flakes, which can be attained only by strongly superheating the iron. The production of such iron in the cupola is feasible only with the addition of large quantities of steel and with the maintenance of a powerful blast and a very high combustion zone. Following this method, it is difficult to obtain a uniform product in the cupola. The electric furnace, not the cupola, is the proper equipment for the production of a really high-test cast iron.

On a report that the materials for locomotive boilers, fire boxes and plates in connection with orders placed in Europe by railroads of South Africa must be supplied according to American standard specifications, the French publication *L'Usine* adds to the surprise expressed by the *Iron and Coal Trade Review*, of London, that such a requirement is the case. The British publication held that British steel works could produce plates of equal quality and the Paris publication adds that European steel plants are capable of producing material corresponding to the American specifications. The information of the European papers is that the plates had to come from any of seven American plants designated by the High Commission of the South African Union.

Standard Units for Forging Furnaces

Various Sizes Quickly Assembled at McCormick Works of International Harvester Co.—Use Gas Burners

IN the matter of heating furnaces for forging work, the McCormick works of the International Harvester Co., Chicago, has adopted a standard unit. From a few sizes of bed, side and end plates, furnaces of varying internal dimensions may be built up quickly. The unit design was made in accordance with the dimensions of standard refractory brick, and the whole is held together with

High Pressure Gas Burner Setting for Small Burner. The firebrick wall with the larger burner is 9 in. thick, against 4 1/2 in., as here shown

The Smaller Burner Is Built Along Lines of This, the Larger, Burner. Its orifice is 3 x 3/16 in.

tie rod construction. Arches are 9 in. deep and made up in sections clamped together in the conventional manner. The roof of a furnace is easily removed by simply lifting out these sections one at a time.

The individual furnaces are mounted on standards constructed of pipe with cross members for stiffening the legs. There is a clearance of 12 in. between the floor and these cross members so that the furnaces may be handled with standard elevating trucks. This not only promotes flexibility in layout, but also permits the removal of a furnace and the substitution of another in the minimum of time.

Some details of the furnaces, accompanied by drawings here reproduced in part, were obtained from J. B. Nealey of the American Gas Association. In substance they are as follows:

In this line of furnaces there are only two hearth widths, 30 and 40 in. respectively, while four depths are included, namely, 9, 13 1/2, 18 and 27 in. The heights of the furnace walls are regulated to maintain a certain ratio of gas consumption with combustion chamber area.

The furnace walls are 4 1/2 in. thick and are not insulated. In front of each furnace a hood is provided which

reaches down almost to the top of the opening through which the work is charged. Just below this opening is a long pipe running parallel to it with a series of holes in the top side. Air is blown through these holes and forces the escaping heat up under the hood, thus to provide good working conditions.

The burner design is an adaptation of the venturi inspirator principle whereby the high-pressure gas induces the flow of air for its combustion. Desired ratios of gas and air can be obtained and maintained continuously by

Typical Furnace May Be Carried by Truck When New Location Is Desired

simply adjusting a shutter, for reducing, neutral or oxidizing furnace atmospheres.

A feature of this design is the burner port which, instead of being round, is flat, to create a fanlike sheet of flame. These burners were designed for manufactured gas of 535 B.t.u. and specific gravity of 0.48 to 0.50. For perfect combustion this gas requires 4 1/2 cu. ft. of air, which the burners will readily handle.

The flat tip or slotted orifice at the discharge end of the burner throws the gas-air mixture in a thin sheet over the furnace refractories. The idea was to increase the width of the flame and reduce its length so that the size of the combustion chamber could be decreased. The most efficient forge furnace has a combustion chamber so reduced in size in proportion to the size of the work that the latter will be as near the refractories as possible, to obtain the maximum of heat absorption. As flame impingement is not desirable for some work this distance is partly controlled by the length of the flame. The refractories on all six sides of the work are brought up to incandescence.

These burners are cast with the inspirator as an integral part. The number of burners to a furnace is controlled by the size of the burners, the internal dimensions of the furnace and the temperatures desired. While these burners normally operate with gas at 15 lb. pressure, they can be turned down to as low as 1 lb. The arrangement depends upon the class of work and they fire from the

front, ends, above, below or any combination of these as necessary. Manifolds into which the burners are screwed are clamped to the walls of the furnaces, allowing for quick removal and replacement. The gas is piped direct to the manifolds which supply it to the burners.

There are two sizes of burners, one with a slotted opening 3 in. long and 3/16 in. wide and the other 3 7/16 in. long and 1/4 in. wide. The first is 6 7/16 in. long and the latter 10 15/16 in. in length. Brass spuds of three drillings, 44, 42 and 32, are used.

With gas at 12 lb. the larger burner will consume 160 cu. ft. of gas an hour with No. 44 spud, 260 cu. ft. with No. 42 and 340 cu. ft. with No. 32 spud. With the same pressure the gas consumption of the smaller burner is 70 cu. ft. an hour with a No. 44 spud, 110 cu. ft. with a No. 42 and 175 cu. ft. with a No. 32 spud. Burners are apportioned to the various sizes of furnaces in accordance with a predetermined ratio. This ratio is based upon a rate of gas consumption of 660 cu. ft. an hour for 1 cu. ft. of combustion chamber volume.

In the design of the burners precautions against overheating were taken by the following means: (1) insulation around burner in the form of ground asbestos, (2) large throat diameter compared with size of spud orifice, (3) smallness of end area of burner presented to heat of furnace, (4) minimum amount of metal in burner to retain heat, and (5) no change in flow of gases after leaving orifice, which permits a faster flame propagation.

The average life of the furnace hearths in this plant is only four months when used in conjunction with hammers, bulldozers, benders, upsetters, etc., while the walls and arch will stand up for a year at least. On high-temperatures high-production work hearth changes may be necessary as frequently as every few days, due to the limitations of the refractories.

In order to heat the stock to 1800 deg. Fahr. with the requisite speed it has been found that the hearth must be carried at 2200 deg., giving the furnace a thermal head of 400 deg. This gives heat penetration at the rate of 1/8 in. per min., which means that stock 1 in. in diameter or thickness requires 4 min. to be brought up to temperature. In order to determine the time element in bringing larger stock up to forging temperature, add approximately 25 per cent more time for each additional 1/2 in. in diameter or thickness. The gas at the time it is received at this plant is under a pressure of 4 lb., but is raised to 15 lb. in two compressors, each of which has a capacity of 2000 cu. ft. per min.

There are two forge shops at the McCormick plant, one 60 x 450 ft. for making bolts and nuts, and the other 90 x 650 ft. for miscellaneous forgings. In this latter shop are located approximately 125 forges and about the same number of upsetters, bulldozers, Bradley hammers, drop hammers, benders, etc. The other forge shop contains 54 forge furnaces and about the same number of hot press bolt headers and nut machines.

Germany Promoting Greater Use of Aluminum

THE recent aluminum price reduction in Germany of £10 per ton has been interpreted unofficially, says the United States Department of Commerce, as a move intended to promote a more extensive use of the metal. The European Aluminum Cartel, which has been in existence for more than a year and a half, was apparently organized primarily for that purpose. It is stated that the cartel would welcome even more radical downward revisions in the American prices, since they would mean a more rapid popularization of the metal. Further comment by the Department of Commerce in its "Foreign Trade Notes" is as follows:

"The recent action of the cartel coincided with the action of the International Copper Cartel effecting another advance in copper prices. Germany's interest in eliminating copper from its chief industrial applications for the sake of national self-sufficiency gives significance to the contrast in the price behavior of the two metals.

"It was expected that the price reduction on aluminum would affect only wire bars. It appears, however, to concern H-bars and blocks; while the only advantage gained by wire bars in competition with copper is in the advance of copper prices. The interest in electrical applications of aluminum is more pronounced in Germany than in other European countries. The latter are perhaps more interested in aluminum's chances to compete with steel and brass, especially in the form of aluminum alloys, on which extensive research and experiments are being conducted in all aluminum producing countries.

"The statement that the European cartel would welcome another price cut on the part of American producers is not without reservations, as it is stated that an immediate cut would not be desirable. Any sudden action with respect to prices might prove embarrassing at present to certain European countries whose output exceeds the domestic consumption to an extent making it imperative to preserve export markets. Germany appears to be in a position to view any such developments without apprehension, since its own domestic market takes care of the entire domestic pro-

duction. Concern is expressed on behalf of France, whose aluminum exports to the United States are of some importance. It is feared that the high import duty and cost of transportation might easily counterbalance such uncertain advantage as the lower prices of the French product, even though the American prices may never go as low as the European.

"It is stated that the German production of aluminum is much greater than is generally believed. The popular error that the recent price cut was due to the employment of the more economical Hagelund process has been explained by German authorities. It appears that the Hagelund process is not yet used to an extent to influence European prices. An experimental plant at Lautawerk is equipped on a comparatively large scale, but the only plant designed to use the process on a commercial basis is now under construction near Venice. There are also experimental plants in several other countries."

"An Investigation of Web Stresses in Reinforced Concrete Beams" is the subject of a 106-page bulletin, No. 166, of the Engineering Experiment Station of the University of Illinois, the price of which is 60c. Illustrations show graphically how beams fail under varying conditions of load. Tests were made with several types of reinforcing and with both concentrated and distributed loads. The author is Frank A. Richart, assistant professor of mechanics.

"Modern Methods in an Old Industry" is the title of a handsome booklet of 28 pages issued by the Belle City Malleable Iron Co., Racine, Wis. It shows how the company doubled its capacity to meet growing demands. Photographic illustrations are numerous, running all the way from action views in the plant to photomicrographs taken from some of the product. An electric furnace in the steel castings department comes in for its share of attention.

BOOK REVIEWS

Relation of Safety and Production

Safety and Production. Report by the American Engineering Council. Pages, 414, 6 x 9¼ in.; 283 charts, 31 tables. Published by Harper & Brothers, New York. Price, \$5.

The Manual of Industrial Safety. By Sidney J. Williams, C. E. Pages, 197, 5½ x 8 in. Published by the A. W. Shaw Co., Chicago. Price, \$2.50.

The inquiry, the subject of the first book, was intended to cover the following points: If industrial accidents under the conditions of increased production occasion increased frequency and severity, are these latter increases, if any, in greater or less proportion than that in production? If industrial accidents can be controlled under modern production conditions; how does safety interfere with production? If positive correlation exists between safety performance and efficiency of production, is the safety factor the efficient one? If safety is an executive responsibility, and if the key to the safety movement is executive, what degree of improvement can be attained in safety performance, and what reduction can be expected in the costs of industrial accidents?

The difficulty in making the investigation and in drawing conclusions therefrom lies in the fact that both production and safety are the integration of so many factors. But it has been possible to base the investigation on statistics, as average number of employees and of man-hours, annual production, and number of lost-time accidents per year, and number of days lost due thereto.

Three levels of performance have been considered: A high one, where production rate increased and the accident frequency rate decreased in 60 per cent or more of the year-to-year changes; a lower level, where the contrary was the case; and all the cases considered together as forming a mean-level group.

The question of cost of accidents is considered only accidentally, although costs are a factor in any accident experience; but this matter is taken up in a section devoted to individual accidents.

As a result of the findings we have:

- 1.—Industrial accidents can be controlled under modern conditions of highly efficient production; the rate of change in production per man-hour is greater than the rate of change in accident frequency or that in accident severity per man-hour. (Quantitatively, the production rate increased 14.4 per cent in three years while the accident frequency rate was 10.4 per cent lower and the accident severity rate 5 per cent higher.

- 2.—Wide experience shows that material reductions in accident rates can be had with greater production.

- 3.—Major executives are as much bound to initiate accident prevention as to effect greater production.

- 4.—Efforts to improve safety performance do not interfere with production.

- 5.—Ordinarily, greatest production comes only where accidents tend to the irreducible minimum.

- 6.—Tremendous improvements can be attained in production and accident prevention.

- 7.—Cost of industrial accidents must not be left unconsidered.

- 8.—Organized safety work is found in but few industrial plants.

- 9.—Many industrial establishments keep no accident records, and make no attempt to analyze their experience as the first step in reducing accidents.

As might be expected from this committee, it does not stop with statistics and conclusions, but goes on to make recommendations. These may be briefly stated as: (1) Giving the same executive direction and control to decreasing

ing accidents as to increasing production. (2) Adoption of a uniform terminology. (3) Those plants that have proportionately high accident rates should try to get down to the same rate as those having few and minor accidents. (4) Associations should impress on their members the necessity of cutting down the accident rates. (5) Associations should compile and analyze statistics, in order to determine the lowest accident rate possible in each industry. (6) Associations should influence their executives in their industry to get the lowest possible accident rate for each industry.

The various "graphs" in this interesting and useful volume show that by-product coke ovens, foundries, cement works, electric light and power plants, electric railroads, manufactories of explosives, lumber plants, paper, pulp and paper-products works, sheet-metal plants, and steam railroads (both freight and passenger), telephone and telegraph service, furniture factories, machine works, metal-working plants, mining concerns and quarries, bee-hive coke plants and the manufacture of boots and shoes, and of gas, the frequency and severity of accidents decreased at the same time as increased production. In men's clothing, and in the brass, bronze and copper products industries, the frequency increased slightly more rapidly than the production, but the severity decreased. In the automobile industry and in the manufacture of fine machinery and the production of forgings and that of valves and fittings, in making writing paper and wood products, and in textile manufacture, the severity increased very slightly more than the production, the frequency rate a trifle less rapidly. In bituminous coal mining the fatality rate increased slightly more rapidly than the production rate.

As might be expected from a report by the American Engineering Council, the work is a credit to its authors and to the publishers. The table of contents is clear and the alphabetical index full and satisfactory.

There have been a good many and a good many kinds of researches and experiments in industrial safety, by manufacturers, railroad managers and others, but until comparatively recently the practical results of their findings have not been collated and placed within the reach of those who are, or should be, interested. The volume by Mr. Williams, while not at all exhausting the subject, is a step in this direction.

It shows that the most desirable results of the movements and experiments in the direction of securing safety for industrial employees—and machinery and equipment—have been attained by cooperation rather than by authority or enforcement. The safety committee is emphasized as the mainstay of the "safety man"; but the importance of the foreman's attitude is pointed out. Inspections and reports of the safety committee are accorded due value.

Meetings for the consideration of the safety campaign are described and the functions and advantages of publicity by bulletin board, printed or other posters, serious or humorous.

Also included are company magazine, and premiums, bonuses and temporary signs. There is a rather good description of campaigns, competitions, and rewards; and the question of records is handled quite satisfactorily—for instance as to what records should be reported and tabulated, and the use of frequency and severity rates; the employment of statistics for the safety committee and the workmen is pointed out as desirable.

A special chapter is devoted to the fundamentals of

machine guarding and the matter of quick-stop devices, and to the danger caused by slippery floors. The safe guarding of the plant equipment by railroads, and construction and use of safety ladders and scaffoldings, is the theme of another chapter, in which, also, we find such topics as grinding-wheels, gas and electric welding and cutting, and the control of hand tools.

The effect of safety on morale is considered. An entire chapter is given up to fire prevention and protection, and of course it is necessary to go into the question of public accidents, such as those to trespassers and passers-by, to passengers or customers, and to employees in public places. Taking it by and large, this book should be in the hands of every foreman and department head in industrial service.

ROBERT GRIMSHAW.

Abrasives and Grinding

The Abrasive Handbook. By Fred B. Jacobs. Pages 547, 6 x 9 in., numerous illustrations and several tables. Published by the Penton Publishing Co., Cleveland. Price, \$5.

This compilation should be very useful to machine shops, in that it gives the results of the combined experience of many well known manufacturers and users of abrasive materials and grinding machines and appliances. Its arrangement differs from that of most technical works in that under each section—for instance, cylindrical grinding, or honing practice—the items are arranged alphabetically.

There is an immense amount of data covering machines, materials, and methods of practice obtained from about a hundred firms and individuals, to whom credit is given in a general way in an alphabetical list of contributors, although very often there is no means of knowing which of these is responsible for any particular chapter or statement.

As principal section heads or topics we find a description of the various abrasive materials, cylindrical and disk grinding machines, grinding wheels and practice, and honing practice, miscellaneous abrasive data, operations, polishing and buffing, and safe operation of wheels.

Management Matters Common to All Industrial Enterprises

Management in the Factory. By Glenn Lion Gardiner. Pages 225, 4 3/4 x 7 3/4 in. Published by the McGraw-Hill Book Co., New York. Price, \$2.

This work intends "to present an elementary consideration of the divisions and functions of management which are common to practically all industrial enterprises." This alone is no mean task; and by reason of the fact that production and inspection methods in every plant are more or less peculiar thereto, the author very wisely omits consideration thereof; and maintenance is left out, because it would require a volume in itself.

Passing over a general chapter on forms of industrial organization, we come unexpectedly to the importance of the sales department and the methods of selling. In this the organization and assignment of territory are well handled, but under the head of bonuses, the author might have mentioned the great failure of that system of remuneration of salesmen. Often after the bonuses have been accorded (say in January) for the amount of sales, returns are likely to come in in alarming quantities, where customers have been overloaded, perhaps with goods requiring checking, relabeling, etc.

The place of the purchasing department in the organization is laid down; but I do not agree with the author that the purchasing for a foundry, for instance, is simple. And sufficient attention is not paid to the matter of foresight as regards the possible trend of the market. Under "Stores" a little more attention might have been given to the importance of balancing the stock.

The chapter on traffic is admirably handled; that on welfare service well, although with a tinge of idealism. Under accounting sufficient attention is not paid to cost accounting, particularly that branch that predetermines production cost, and more especially its application to cost reduction.

The undoubted advantages of teamwork are given a special chapter, but in this the author states that there are only three factors in production—man, materials and equipment; whereas no business could get along without consideration of three others—a market to supply, money to start and run the business, and, above all, management; the omission of the latter being rather unexpected in a work on that topic.

To each chapter there is a short questionnaire. A good table of contents and an alphabetical index enhance the value of the book.

ROBERT GRIMSHAW.

Procedure in Taking Out a Patent

Patent Essentials. For the Executive, Engineer, Lawyer and Inventor. By John F. Robb. Pages 485, 5 3/8 x 8 3/8 in.; illustrations, 19. Published by Funk & Wagnalls Co., New York. Price, \$5.

In this inventive age and country everyone is directly or indirectly interested in the subject of patents; and a larger proportion of our people are actual or potential inventors than in any other land. Hence even to the layman—meaning him or her who is not a patent lawyer—a work treating of those matters concerning the law and practice before the United States Patent Office, that are essential for the executive, engineer, lawyer and inventor, should be of great value, not merely to refer to in case of need, but to study in order to ward off possible trouble in patent matters.

Mr. Robb and his associates have produced such a volume, of which this is the revised edition of the current year. The work, says the principal author, is intentionally rudimentary and practical, being intended to enable quick acquirement of a working knowledge about patents and things pertaining thereto. It is what I would call, coining an expression for the purpose, an "at elbow book," and is particularly valuable because it contains features hitherto lacking in any work on patents—namely, the treatment of the science of drafting patent claims, and complete illustrative cases, as well as complete forms rather than the mere skeletons usually given.

In the preface to this second edition the author pats himself on the back, probably with full justification, because the chapter on claims and their formulation had been especially well received, and many of the objections in the first edition, including changes in old law and practice that he had denounced, stand accomplished.

The first chapter is on the purpose and the personnel of our Patent Office, jurisdiction and procedure, the progress of an invention through the office (from application to patent) and brief definitions of patent terms; the second, on the utility of invention, patent infringement, the validity of patents, infringement, validity, and other investigations. This is followed by one on evaluation and depreciation, that patentees and intending patentees should study in order to save themselves much disappointment.

Chapter IV, a symposium by various members of that much abused class, patent examiners, covers invention and mechanical skill, combination vs. aggregation, mechanical processes and functional claims, practice relating to division, and new matter. Chapter V goes fully into details of the preparation of applications, clear through to the correction of drawings. Chapter VI divides and treats all patents as either accidental, abstract or complete, and considers claims as what they should be—word pictures.

The next chapter is very precise in its handling of the practical operation of important Patent Office rules; while

the eighth takes up that heart-breaking matter, appeals. The section on additional patents will open the eyes of many who think themselves covered by their claims. Other divisions of the book are devoted to assignments and contracts, interference; and in notable fullness, special forms of procedure, followed by a typical mechanical patent application as completely prosecuted, and a typical reissue patent application, file wrapper, contents and drawings, complete enough for the most meticulous.

The typography of the text is unusually clear; not so, that of the otherwise excellent index, which supplements the clearly laid down table of contents, and the table of 350 or so decisions cited.

It would seem impossible that a book on such broad lines, by a successful patent lawyer of nearly thirty years' experience in his specialty, aided by five patent examiners, would be other than both useful and reliable.

Savings Through Scientific Management in Swedish Iron Works

How a Swedish rolling mill employing over 1000 men was enabled to meet the problem of quick deliveries with a smaller force was described by Olaf Kaernekuhl, of Stockholm, to the Third International Congress of Scientific Management, held in Rome during September, and reported in *Engineer*, London.

By reorganizing the warehousing and shipping departments, the staff was reduced 27 per cent, notwithstanding an increase of 24 per cent in the volume of materials handled. In order to take care of the demand for quick deliveries, a budget of raw materials is prepared periodically based on the orders on the books. Actual consumption comes within 1 or 2 per cent of the budget. Metal stocks were reduced by 626 tons and economical use of material showed a saving during twelve months of 166 tons. All work was carefully planned, and the processes studied in detail with the aid of time studies. In the more complicated operations as many as 11,000 observations were made before the final working procedure was determined. The resulting control of the load on the machinery during different shifts and working days has reduced the number of workers employed in the rolling mills alone from 175 to 155 for the same output. In the tube works the output per man each week increased during the twelve months from 318 kilos. to 360 kilos.

Handbook of Labor Statistics

Many subjects of a wide variety of interest are comprised within the 828 pages of the "Handbook of Labor Statistics, 1924-1926," which has been issued as Bulletin No. 439 of the United States Bureau of Labor Statistics. Copies may be obtained at \$1 each from the Superintendent of Documents, Government Printing Office, Washington. Much of the volume naturally is taken up with the question of employee relationships, apprenticeship, arbitration and conciliation, cooperative societies, employment statistics, industrial accidents, disease and poisons, insurance and benefits, labor organizations, legal aid, minimum wage, old age pensions, physical examinations, strikes and lockouts, unemployment insurance, vocational education, workmen's compensation, and the like.

Among the items of particular interest may be mentioned the occupational distribution of the population of the United States. This has been studied over a long period of years and changes are traced in some of the more important lines of activity. Turnover of labor for a number of industries has been studied, showing month by month changes over a period of years and an analysis of turnover among a large number of types of employment in December, 1926, and January, 1927.

Wages and hours of labor occupy more than one-eighth

of the book. The subject is gone into in great detail, with index numbers of wages based on 1913 over a period of years, and for a large number of occupations, as one of the leading compilations. Hourly and weekly earnings are shown for many employees. In particular, there is a considerable study of wages and hours in the iron and steel industry, from 1913 to 1926 inclusive. Wholesale and retail prices are covered in one chapter of more than 30 pages.

Seamless Steel Tubing for Aircraft Industry

Practice followed in the manufacture and preparation for shipment of seamless steel tubing for the aircraft industry has been put in the form of a small pamphlet by the Summerill Tubing Co., Bridgeport, Pa. This company makes its finished product from purchased hot-rolled pierced tubes, of materials selected according to definite specifications. Following the practice employed by the company in its selection of this material are listed 12 operations performed in its own works.

Identification of the individual steel heats is one of the first requirements. Annealing and pickling in preparation for drawing are watched to avoid excessive scale, change in carbon content, and rough surfaces from over-pickling. Drawing may involve 12 or 15 cycles of operations.

After straightening, a final heat treatment is given the steel tubing. This is done in a gas-fired furnace with automatic control. An aircraft inspection department is maintained, independently of the commercial grades of steel. Tests for hardness and other requirements are made and record kept, by tubes numbered consecutively. Certified test reports are then furnished with each shipment and are attached to the invoice.

New Books Received

The Cost of Living in Twelve Industrial Cities. Pages 76, 6¼ x 9½ in. Issued by the National Industrial Conference Board, Inc., 247 Park Avenue, New York. Price, \$1.50.

Motor-Driven Wire Cutting and Straightening Machine

TO meet the demand for a medium-weight, motor-driven, wire cutting and straightening machine, the Lewis Machine Co., Cleveland, has brought out an automatic rotary-type machine for handling wire up to 3/16 in. in diameter. It has several new features, probably the most

speed gearing, oil housings and the noise and vibration that result from the use of gears. The motor is located underneath the machine, being mounted on a bracket bolted to the machine leg.

Bulky castings have been eliminated in the construction, though the

Operating Parts of This Straightening Machine Have Been Reduced to a Minimum. The motor is out of the way and the drive mechanism is claimed to avoid noise and vibration

important of which is a double direct motor drive known as the Texrope drive, made by the Allis-Chalmers Mfg. Co. The straightening arbor requires high-speed power transmission, and this drive eliminates high-

machine is rigidly built for hard service. The straightening arbor, main driveshaft and flywheel are mounted on Timken tapered roller bearings, a total of six to each machine. The arbor consists of five sets of dies,

which, it is claimed, assures perfect straightening of all sizes of wire. Either hard iron or bronze dies are used, depending on the finish of the wire to be straightened.

Operating parts have been reduced to a minimum, consisting only of a trip lever and clutch dog, which drives the flywheel shaft. This shaft, which revolves only when the wire is being cut off, is mounted on bronze bushings in the bed. The cutter bar is operated by a cam on the flywheel shaft. A ball bearing mounted in the cutter bar runs on the cam. The clutch is similar in general construction features to a standard punch press clutch.

The feed rolls are geared directly to the flywheel. The lower feed roll shaft runs in bronze bushings in the housing and the upper runs in a long sleeve which takes the pressure from the adjusting screws. An automatic feed roll release lever operated directly from the cut-off shaft releases the pressure from the feed rolls when the wire is being cut off. This, it is stated, prevents slipping of the feed rolls on the wire during the cutting off operation, prevents marking of the wire and increases the life of the rolls.

Designated as the Lewis No. 7-C, the machine can handle 1/16-in. to 3/16-in. wire. It is driven by a 1½ hp. motor at 1800 r.p.m. It occupies a floor space (not including reel) of 16½ in. wide by 3 ft. long for a 2-ft. machine and 4 ft. long for a 3-ft. machine. It is also built in a larger size, for handling wire up to ¼ in. in diameter.

Welded Steel Truck Body for Heavy Service

A SHOP truck, known as the "Weld-steel" truck, has been placed on the market by the Pittsburgh Producers Supply Co., Pittsburgh. It was designed for use in steel mills, particularly for handling wire in coils from wire or nail mills, or sheets, plates, and similar material from sheet mills, or any like service. It has been found suitable for use in other industrial plants also, where heavy loads are to be moved. The truck has a rated capacity of 3 tons, with a safe overload capacity of 100 per cent. It is compact, the dimensions being 5 ft. long, 3 ft. wide overall and 3½ ft. overall height.

It is made entirely from steel sections, welded together, no rivets being used. The body is made from four heavy channel sections, lap welded to the four angle sections forming the uprights. The uprights are braced by angle sections which are butt and lap welded to them, and the frame is given greater rigidity by gusset plates located at all four corners.

In the truck shown in the illustration V-ends are provided. When this form is loaded with wire coils set perpendicularly, a pipe or steel bar

can be passed transversely through the load, to permit its being lifted as a unit by a crane. The V-ends are braced by gusset plates welded to the frame.

The main axle is supported by a cannon-box mounting, made of welded angle sections, and firmly braced by angle sections running to the pilot wheel supports. The wheels, also, are of welded construction, the tires and hubs consisting of flat sections, rolled to shape, and butt welded. The spokes are made of heavy flat sections welded to the hub

and tire. The wheels on the main axle are equipped with Timken bearings, the choice of which was determined by the service conditions which the truck must meet. They reduce the amount of power required to move the truck to a point where two men can handle it when fully loaded. Also they are said not to be affected by the expansion and contraction resulting from the wide variations in temperature to which the trucks are subjected in the course of their service, and which sometimes alternate frequently.

Several Forms of This Welded Steel Truck Are Available. It is fitted with roller bearings to reduce friction in handling

The Section Shows How It Works. The exhaust slot appears at the rear, in the photograph

Removing Fumes from Plating Tanks

AN exhaust system for removing fumes from plating tanks is being manufactured by the Cleveland Blow Pipe & Mfg. Co., Cleveland. A sheet metal duct, rectangular in form, surrounds the upper part of the tank, extending slightly above the top, and a narrow slot is provided around the side facing the liquid. An exhaust fan draws sufficient air through the slot at a definite high velocity, de-

pending upon the size of the tank, to form a suction blanket over the tank that prevents fumes from entering the room.

Thus the operator is completely protected, and the top of the tank is unobstructed by overhead exhaust hoods. The fumes are drawn through a header back of the tanks and out into the open air.

The illustration shows an installa-

tion of the system in a Cleveland plant, for the removal of fumes from chromium plating tanks. Complete removal is essential, as these fumes are particularly dangerous to the operator. A line drawing shows the way the fumes are drawn off the surface of the liquid and carried away through the duct to a point where they can do no damage either to the operators or to the equipment.

New 2-Yd. Excavating Shovel

ADDITION of a 2-cu. yd. capacity machine has been made to the line of crawler cranes, shovels and draglines built by Link-Belt Co., Chicago, Indianapolis and Philadelphia. Heretofore the largest machine built by this company was a 1½-yd. unit. The Link-Belt K-55, as the new machine is known, is a powerful, heavy-duty, all-purpose, 2-yd. machine, primarily designed for the following adaptations:

Shovel with 30-ft. boom and 18-ft. dipper stick, carrying a 2-yd. struck-measure-capacity all-manganese-steel dipper.

Dragline -to handle 2-yd. dragline bucket, for medium and medium-heavy excavating, on boom 50 ft. long; or a 1½-yd. dragline bucket on boom 60 ft. long.

Clam shell bucket of 2-yard capacity, for sand, gravel or materials of equal consistency and weight per cubic foot, on boom 50 ft. long; or a 1½-yd. bucket, for such materials, on boom 60 ft. long; or, of course, an equivalent weight of loaded bucket in heavier or lighter materials.

Trench shovel, 2-yd. capacity.

All attachments are interchangeable without removing or disturbing the mechanism of the machine proper. A special clearance-reducing arrangement contributes to making the machine a convenient one for the contractor, by making it possible to ship it from place to place without dismantling. The K-55 has a collapsible mast, and special shipping treads which may be quickly and easily substituted for the working treads, to

bring the machine within the railroad clearance requirements of 10 ft. 4 in. overall width and 16 ft. overall height above top of rail when loaded on flat car.

Specifications include unit cast steel construction of lower and upper frames, self-cleaning crawler treads and large bronze-bushed crawler rollers and inclosed cut gearing and bronze-bushed bearings throughout. There are internal expanding friction clutches of unusual size and power, the main drum clutches being 42 in. in diameter, and swing and travel clutches, 30 in. in diameter.

A 13½-in. diameter center pin, ad-

justable from above, can be removed as a unit with the vertical travel shaft assembly, without removing any other parts. The drums are large, with renewable cast steel shells, having air space between clutch and brake surfaces, for rapid cooling; with large, powerful drum brakes, 48 in. in diameter by 5 in. wide.

In working condition the machine is 12 ft. wide overall at the lower frame, which gives it ample stability for the work for which it is designed. Crawler treads are 36 in. wide. The K-55 is built to be driven with gasoline engine, electric motor or Diesel engine drive.

Ladle Nozzle Made of Two Materials

ANEW combination ladle nozzle is being put out by the Joseph Dixon Crucible Co., Jersey City, manufacturer of crucibles and graphite refractory products. The upper half is super-refractory clay and the lower half is graphite.

The advantage of this combination nozzle, it is stated, is that the metal can leave the ladle at a much lower temperature than is the practice generally, and so a more perfect ingot is poured. This is due to the heat-retaining qualities of the graphite in the lower half of the nozzle. The combination nozzle is made in any customary size and with flow hole as required.

Air-Cushioned Compressor Valve

AN air-cushioned air compressor valve has been developed by the Pennsylvania Pump & Compressor Co., Easton, Pa. There is an air cushion pocket in the guard. As the valve opens, the disks, instead of

Section of Valve, Showing How the Parts Are Assembled

striking the guard, enter the air pocket. Air trapped in this pocket provides a cushion, which prevents the valve from striking the metal of the guard.

The valve assembly is held together by means of a retaining ring, which engages the valve guard and seat. The only function of the retaining ring is to hold the guard and seat together while the valve assembly is being placed in the cylinder chamber or removed from it. With the valve assembly in position, it is held firmly to its seat in the cylinder by the clamp, which is drawn up tight against the assembly by means of the valve cover set screw.

The air valves are mounted radially at each end of the cylinder. Each cover is held in place by four tap bolts, while a central set screw holds the complete valve assembly in place.

Segmental Grinding-Wheel Chuck of Simple Design

SAMUEL C. ROGERS & CO., Buffalo, have placed on the market the segment grinding-wheel chuck here il-

When Half Worn, the Upper Clamps Are Removed and the Wheel Used Further

lustrated, which is offered for use on the company's new knife grinding machines and also on face and surface grinders of other manufacture. Simplicity of construction is a feature emphasized.

Five standard sizes of the chuck, from 12 to 22 in. are available, the chuck illustrated being the 14-in. size which carries eight 4 x 4 x 1 1/4-in. segments. The segments are mounted in a strong and accurately machined chuck having parts which are conveniently adjustable and are arranged for securely holding the segments. The weight of the chuck, with segments, is approximately 60 lb. Larger sizes can be furnished.

The chuck is made up of an inner ring and two sets of clamping wedges. When the segments are worn half way down the outer wedges and the inner ring are removed and use of the wheel continued until the segments are entirely used up. Butts of old segments are removed by loosening the last row of clamping wedges. New segments are then inserted and both rows of clamping wedges are replaced. The wheel is protected with a suitable guard arranged to conform with the wearing of the segments.

Lock Washer of Two Parts With Serrated Edges

CLOSER adjustment than is possible with the standard castelated nut and cotter pin is a feature claimed for the lock washer illus-

Serrations on the Two Washers Are Depended Upon for Locking

trated which is being placed on the market by Robert E. N. Marks, 4403 Sheridan Road, Chicago.

This device consists of two washers, one of which is formed with a center boss and a raised outer edge in which serrations or teeth are cut. This washer is placed over the bolt with the serrated face away from the head and a flat side is provided on the bolt to prevent this washer from turning. The second washer, also formed with a boss and an outer ring of teeth, is dropped over the bolt so that the serrations on both washers match. The second washer is recessed on its outer side, forming a seat for the nut so that the top washer and the nut turn together.

Differential Hoist Has Copper-Plated Chain

A NEW direct differential hoist being manufactured by the Chisholm-Moore Hoist Corporation, Cleveland, is called the "Blue Boy." It has been equipped with the Hercules

Inswell electric-welded load chain. The extra-heavy load sheaves, malleable iron yokes and drop-forged hook are painted blue, and the Inswell chain is copper plated.

Standards for Lift Trucks and Skid Platforms

TWO standard dimensions, 8 in. and 12 in., for under clearance of skid platforms were adopted at a general conference of manufacturers and users, held June 28 at the Department of Commerce. It was agreed that the minimum clearance between runners or supports on the skids be not less than 29 in. The conference favored establishment of standard dimensions for over-all length and width of skid platforms. It was decided that there should be two width standards—one such that the skids could be placed three abreast in a freight car and the other the same length, but twice the width of the first skid. These recommendations, subject to acceptance on the part of interested parties, are to become effective Oct. 1.

Topping a 100-ft. fabricated steel tower on the roof of the new Penobscot Building, Detroit's tallest office building, what is said to be the world's largest and highest Neon aviation beacon was lighted for the first time on Thursday night, June 28. Resembling a red ball of flame when lighted, the beacon is 12 ft. in diameter, 655 ft. above the ground and can be seen 60 miles away on a clear night.

Carwheel Lathe Equipped to Handle Sets with Roller Bearing Journals

CHANGES have been made in the tool rests and bed of the No. 4 carwheel lathe of the Niles-Bement-Pond Co., 111 Broadway, New York,

Changes in the Tool Rests and Bed Adapt the Lathe for Chucking Either Plain Journal or Roller Bearing Wheel Sets

to adapt the machine for the chucking either of plain journal or roller bearing wheel sets for tire turning.

Inasmuch as it is impractical to remove the roller bearing housings from the journals, the wheels cannot be

chucked by split bushings, but are mounted on centers in the sliding spindles, it being necessary only to remove the cover plate of the housing to expose the centers in the axle. This method of chucking requires lateral adjustment of tool rests along the bed to bring the cutting tools opposite the wheel treads, owing to the

greater distance between the faceplates when axles are held on centers. Therefore each tool rest is mounted on a sub-base having a small amount of lateral adjustment by rack and pinion.

Blow Gun for Dusting Out Molds, Machine Tools and Motors

SAVINGS in compressed air are claimed for the blow gun illustrated which is being offered by the

Schutte & Koerting Co., Twelfth and Thompson Streets, Philadelphia, for blowing out castings, dusting out molds, removing dust and chips from machine tools and for other similar uses.

The device operates on the jet principle, and is designed for attachment to a $\frac{3}{8}$ -in. compressed air hose. A button in the small cup on the body of the gun opens a valve and admits the compressed air to the pressure nozzle. A jet of air issues from this nozzle at high velocity and entrains atmospheric air through the rectangular ports, the mixture discharging at pressure high enough for the uses for which the gun is intended. It is stated that with compressed air at 60 lb. pressure the blow gun will deliver a given quantity of air at a moderate pressure, using only 50 per cent of the high-pressure air required with a plain nozzle. A ring is cast on the body of the device so that when not in use the gun may be hung upon a conveniently located hook.

Compressed Air Issuing from the Nozzle Entrain Atmospheric Air, the Mixture Discharging at Ample Pressure for the Work

Long-Boom Motor Crane for Handling Construction Steel

MAKING use of a 52-ft. boom with 7½ tons capacity on a Mack truck of the same capacity, the McClintic-Marshall Co. has put into use a new crane unit furnished by the Universal Crane Co., Sweetland Building, Cleveland. This is being employed in suburban districts of New York for unloading and distributing steel, as well as on erection jobs.

To a standard 28-ft. boom has been added a demountable 8-ft. foot extension and a demountable 16-ft. head extension, making a total length of 28 ft. Both extensions are readily removable, so that the crane may be used with the 28-ft. boom where heavier lifts and not such high reaches are

Flexibility Is Provided by Having the Boom in Demountable Sections

necessary. The boom can be used in lengths of 28, 36, 44 and 52 ft.

A motor truck crawler is fitted on the rear end of the truck chassis, which consists altogether of a combination truck and crawler. This is convertible in 15 or 20 min. to a crawler rear end, capable of traveling through soft ground at truck speed.

June shipments of electric industrial trucks and tractors numbered 117, compared with 116 in May as reported by the Department of Commerce. The figures compare with 140 in June last year. Of the current total 14 vehicles were for export. Six of the domestic units were tractors and 97 of other types. In the first half, 732 units were shipped, compared with 695 last year.

Business Analysis and Forecast

No Over-production of Steel Indicated

Though Output Is Large, and Requirements Absorb Production, Prices Remain Weak—Situation Analyzed by Series of Questions

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

AS shown in the first chart, the broad statistical facts concerning the steel industry as it was in June are as follows: (1) Production of steel ingots was at a reduced rate, but was still considerably above "normal"; (2) unfilled orders of the Steel Corporation recovered from the slump of the preceding three months, but were still much below the monthly average for 1923-1927, even allowing for seasonal conditions; (3) the composite price of finished steel sagged slightly to the lowest monthly average since last January. In short, production is large, order books are low, and prices are naturally weak.

According to our estimate of normal, the average daily ingot output last month was 108.9 per cent, which compares with 110.3 per cent in May and 102.8 per cent a year ago. Thus, even after discounting a seasonal decline (from May to June) of over 6 per cent, there was left a net decrease; but production remained nearly 9 per cent above normal. In spite of seasonal influence the unfilled orders increased $6\frac{1}{2}$ per cent. Even so they were actually only 84 per cent of the monthly average for the past five years, or 90 per cent, if we make ad-

justment for seasonal conditions. At 2.341c., the June average price of finished steel was only 92.7 per cent of the average for 1923-1927.

One can find no month in any recent year which is analogous to June in the sense that all of the foregoing statements would apply. And the peculiarity of the situation is the more marked if we add that in no recent year has steel production, throughout the first half, been so much further above normal trend than pig iron production has been above its trend. As we figure it, the average daily pig iron production in June was 106.3 per cent of normal, which compares with 106.8 in May and 107.2 a year ago.

Production Below the Heavy Demand

WHILE steel production is above normal, May figures show that in that month it was below the level of the normal current requirements of the chief consuming industries. That is to say, a composite of the indexes of activity in the chief iron and steel consuming industries shows that their potential requirements were relatively high (see Fig. 2).

Railroad traffic gained more than usual for the season, and both automobile production and building activity showed an upward trend. Even manufacturing (excluding iron and steel and automobile industries) increased. Mining held about level, declines in coal production being offset by gains in copper. Domestic oil production and drilling activity both showed further small decreases. Machine tool orders declined, and agricultural purchasing power was a little lower. The net result is that the composite index of potential demand for steel for May increased to 119, as compared with 115 in April. This is not so high as in February, but, with that exception, is the highest since September, 1926.

As the chart shows, it is well above the usual relation with the curve of steel ingot output. This means that, in spite of the decline in forward buying which occurred in May, the chief customers of the steel industry were using up steel at a rapid rate and that the steel producers were either accumulating no stocks, or only such as the potential requirements of the country justified. In short, no over-production is indicated by the statistics.

Fig. 1—Steel Production in June Was 9 Per Cent Above Normal Requirements. Prices have been sagging. Unfilled orders showed an upward movement at the end of June

Fig. 2—Steel Production Has Again Fallen Below the Level of Composite Demand. This latter is higher than at the same season in previous years

June data show railroad freight traffic not up to the usual seasonal gain for the month, and indicate continued scanty buying on the part of the carriers. Orders for railroad cars and locomotives were the lowest since January. On the other hand, building activity did not show the usual June decrease, and the large volume of contracts awarded promises further good business in structural steel. Building permits showed an upward trend also. Trade reports indicate June awards of fabricated structural steel larger than in May, the weekly average being 42,000 tons, compared with 22,800 tons in the preceding month. Automobile production is tapering, but holds unusually well for the season. Apparently general manufacturing activity is well sustained.

Five-Month Total of Sales Highest Yet

CONFORMING to the indications of the composite demand line, our index of orders and sales, covering some of the chief items of finished steel, increased in May. This is the only one of the six years, shown in the third chart, in which sales increased in that month. The May figure is much above that for the same month in any of the preceding years. As a result, the total sales of finished steel for the first five months exceeded those for the same period, even in 1923.

Sales of steel sheets and plates fell off in May, which is usually a seasonal occurrence, while the sales of structural steel and steel castings increased

over April. All four of these items, which together totaled 3,448,000 tons, were much above May last year, when the total was 3,203,000 tons. It is to be remembered in this connection, however, that May this year had one more working day.

Why the Present Steel Situation

SO unusual is the steel situation at present that a number of queries are suggested:

(1) Is steel production in the first half of 1928 record-breaking?

Answer: Not in any true sense. If we allow for the slow, steady, normal growth of the requirements of the country, conservatively estimated, we find that steel production in the first six months was relatively smaller than in either 1923 or 1926. A carefully

Fig. 3—Buying of Finished Steel Was Higher in May Than in That Month in Any Previous Year Shown. The cumulative total is the greatest for any year on the diagram

adjusted index, showing what percentage the average daily production of steel ingots is of normal, averaged 109.2 in the first half of 1928, 111.3 in the first half of 1926, and 113.9 in the first half of 1923. The index for April, 1928, which is the peak month of the year, is 119.1; for May, 1923, it is 122.5. Thus steel production is absolutely higher, but has not maintained its normal rate of growth.

(2) *Why is steel production so well maintained at around 8 to 10 per cent above normal, while prices are low, unfilled orders small, and railroad freight traffic and factory labor employment relatively low?*

Answer: In spite of small forward buying, the activity in the steel consuming industries is such as to make current requirements large enough to take care of an above-normal steel output. Steel production is below the level of our composite demand curve and orders for finished steel are well over 110 per cent of the average for the last five years. In spite of reduced railroad buying, the automobile, building, tin plate and agricultural implement businesses have been operating at above-normal rates.

(3) *Why then are steel prices so low?*

Answer: The production of steel is considerably below the capacity of the steel producers and is well up to current requirements. Competition among producers is keen in a good many directions, and there is no shortage of supply in prospect. At the same time, the general trend of commodity prices is downward, and competition among buyers is so keen that their margins of profit are low and they cannot afford to pay high prices. The automobile sheet business is a strong illustration. In a

sense, the low prices make possible the high production.

(4) *Why is pig iron so low in price?*

Answer: Pig iron is cheap compared with finished steel, about right compared with scrap, and about as low as it ever gets compared with coke. In comparison with their estimated normal levels of production, the output of pig iron is not too high, as judged by steel production. One almost infallible barometer of pig iron prices, however, is found in the ratio of pig iron production to steel ingot production, taking into consideration the level of steel prices. When this ratio turns upward and is high, pig iron is always weak in price. This condition has existed in most of the months since February, 1927, and during that time the general trend of pig iron prices has been downward.

Other reasons are as follows: Imports of pig iron, though lower in May, in the first five months of the year were 35 per cent greater than in the same period of 1927. Pig iron is weak in foreign markets and production in France and Belgium exceeds the output of crude steel. The domestic markets for pig iron are highly competitive, with water transportation playing an increased part. Low coke prices have facilitated the decline in pig iron.

(5) *Why the considerable increase in unfilled orders in June?*

Answer: In large part, the increase must have been due to three conditions: (1) additions to and extensions of second quarter contracts that had been made at lower than current prices; (2) declining shipments; (3) a few large orders for line pipe, tin plate and bridges, placed toward the end of June.

(6) *Does the increase in unfilled orders forecast an upturn in steel production and prices?*

Answer: No. In the first place, the nature of the causes of the increase deprives it of much of its significance. It will be noted that it did not occur at the same time with expanding production, as was the case in 1922 and in 1924; on the contrary, it occurred with steel production declining from a high point. In the second place, the significant rises in unfilled orders rarely come as such sharp reversals of trend as this one. Usually, making allowance for seasonal variation, significant increases come after the unfilled orders have tapered off in their decline and have then begun to rise gradually. In the third place, there is nothing in the general condition of industry to explain any such rush of forward buying as the upturn might seem to indicate.

(7) *With automobile production and building activity so great, and taking such quantities of sheets as would seem necessary, why are sheet prices so weak?*

Answer: According to returns from "independent" manufacturers of sheets (who produce probably upward of 75 per cent of the total output), production of sheets was very large and on the increase in May. It was above shipments. As a result, stocks increased. The sales of sheets do not show a rising trend, but the contrary. A three-month moving average has pointed downward steadily since December, and May sales were the lowest since last October. Evidently automobile makers are taking a smaller quantity of sheets as they near the period of seasonal decline. Residential building has increased only in New York, where apartment construction is the outstanding feature.

Fig. 4—Finished Steel Prices (in Particular, Sheets and Nails) Are Relatively Low, Compared with Semi-Finished and Raw Materials. But supplies are abundant and improvement is not indicated

No Improvement in European Markets

Holidays Hamper British Output—Lower Prices Hit German Steel Production—Consumption Active in Japan

(By Cable)

LONDON, ENGLAND, July 16.

IRON and steel markets are quiet, as the Glasgow Fair holidays have commenced. Normal resumption cannot be expected before the end of this month. The pig iron position is getting worse, as both domestic and export demand are poor; consumers are not making forward contracts. Cleveland producers are still well placed for a few weeks, on restricted output, but are desirous of putting new business on their books. Hematite is practically dormant, except for a few small export sales.

Foreign ore markets are idle, as consumers are well covered, but the Swedish strike continues. There is some tendency among German users to enter into two-year contracts at a flat rate.

Finished steel markets are quiet, in the heavy branches, and competition among makers is keen in non-association products. Plate mills, especially, are in need of orders, but the sheet mills and constructional and en-

gineering departments are moderately busy.

June exports of pig iron were 33,200 tons, of which 6500 tons went to the United States. Total iron and steel exports were 365,900 tons.

Tin plate markets are quiet and there is talk of reimposing the output restriction for October to December. Makers at present are well sold and the mills are running at well over 90 per cent of capacity. Consumers' demand has been affected by recent weakness in tin, but it is expected to revive when the tin situation is more settled. There is considerable inquiry still circulating. Over 54,000 tons of tin plate and terne plate was exported in June. Galvanized sheets are quiet and black sheets are dull.

On the Continent

Continental iron and steel markets are quiet, as regards consumers' demand, but the termination of the Antwerp dockers' strike caused some merchant covering. Prices generally are steady, with a slight upward tendency in semi-finished materials.

is the weakening of the Continental market, which had been active, with rising prices, since October, 1927. The general outlook for iron and steel is a gradual decline of production during the remainder of this year and it is almost certain that 1928 will not repeat the high production of 1927.

Comparative production figures for the last reported month and for the first five months of the year are:

	May, 1928	May, 1927
	Metric Tons	
Pig iron	1,044,046	1,129,802
Ingots	1,247,781	1,377,737
Rolled steel..	986,459	1,087,068
	Jan.-May, 1928 Jan.-May, 1927	
	Metric Tons	
Pig iron	5,565,030	5,297,474
Ingots	6,619,077	6,625,147
Rolled steel..	5,197,954	5,228,571

Output of Steel Falling

Average output per working day has been falling since March. The demand for steel from the building industry is lower than was expected. The demand from engineering and machinery-construction works has declined. Home shipbuilding is inactive and the Railroads Corporation is giving only very small orders for permanent way materials. June production returns will probably show further declines for pig iron, steel, and rolled goods.

Uncertainty in Export Market

The export market is uncertain. In the second and third weeks of

German Steel Output Declining

Weakening in Home Market and in Continental Prices—Cartel Uninfluenced by American Export Combine

BERLIN, June 30.—The slackening of home trade continues to react upon activity in iron and steel. Employment, owing to seasonal influ-

ences, is still improving and wages are rising; but the trade slackening is unmistakable. A further unfavorable influence on the steel industry

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

(a) Nominal.

June export orders declined. This was followed by a brief revival, but toward the end of the month the Continental market again weakened. French and Belgian prices fell. German export prices were also slightly cut. The Stahlwerksverband, which had been exporting bars at £5 15s. (\$27.90) per ton cut its price to £5 14s. (\$27.65). Owing to big ship-building orders, the Continental sheet market has not shared in the new general weakening. German home prices of wire cables have been raised on an average 3 per cent. Wholesale prices of German iron and steel on June 27 averaged 28.3 per cent more than in 1913-14; wholesale prices of machinery, machine-tools, and other metal instruments of production 37.1 per cent more than in 1913-14.

No important measures were decided upon at the quarterly general meeting of the International Steel Cartel held at Düsseldorf on June 26. As president of the cartel, to replace the late M. Mayrisch, was elected Director-General Meyer, who had already succeeded M. Mayrisch as chief of the Arbed Corporation of Luxemburg. The effect of this election will be that Luxemburg will continue as headquarters of the cartel. No change was made in the cartel's production program for the third quarter of 1928 or in the quotas of the member countries. The existing system of mitigating Germany's penalties for exceeding its production quota will be retained. This system consists in exacting the full penalty of \$4 per ton only upon that part of Germany's over-quota production which is exported, while the part sold at home is penalized only to the extent of \$1 per ton.

Nothing was done to form the long-planned selling syndicates for the individual products controlled by the cartel, but the matter was discussed unofficially. The question of Poland's entry into the cartel did not come up. The Central European group, consisting of Czechoslovakia, Austria, and Hungary, which at present belongs to the cartel as an indivisible unit, applied to be dissolved into three national units. At present this three-country group has a combined production quota of about 2,100,000 metric tons. A commission was appointed to consider the application for dissolution.

Cartel Uninfluenced By American Action

The cartel's policy has not been influenced by the news of the foundation of the Steel Export Association of America, but the American move has made a considerable stir in West Germany steel circles. Düsseldorf experts express the view that an active American policy in the sense of the Steel Export Association would tend to stabilize world prices and European prices. But they affirm that no serious American invasion of the European market is likely, even if there is a decline in the

American home demand. This view is based upon the high land and water freight charges which American exporters would have to bear. The fact that Canada, South America, and the Far East, in which the freight advantage lies with the United States, have hitherto been the chief takers of American iron, is adduced as a further argument.

British Exports Up; Imports Down

WASHINGTON, July 17.—Continuing tendencies of previous recent months, exports of iron and steel from the United Kingdom increased and imports decreased in June. The outgoing movement was 365,890 gross tons, a gain of 6873 tons or 1.9 per cent when compared with May. Imports totaled 210,405 gross tons, a decline of 26,447 tons or 11.2 per cent, according to a radiogram received by the Department of Commerce from the American Commercial Attaché in London. The import tonnage was the lowest for any month since June, 1925.

Increase in the export shipments was reflected in 15 of the 22 classes into which the trade is divided. The net gain, however, was held down by the substantial losses in galvanized sheets, which dropped to 54,167 tons in June as against 61,061 tons in May, a decrease of 6894 tons; in pig iron, which declined to 39,284 tons from 45,084 tons, a loss of 5800 tons; in cast iron tubes, which decreased to 8560 tons from 12,097 tons, a drop of 3537 tons; and in wrought tubes, which declined to 22,478 tons from 24,923 tons, a drop of 2445 tons.

Some of the more important gains were made in tin plate, which rose to 54,615 tons from 47,358 tons, a gain of 7257 tons; in steel bars, which increased to 29,874 tons from 24,190 tons, a gain of 5684 tons; in rails, which increased to 25,388 tons from 22,206 tons, a gain of 3182 tons; in hoops, which totaled 6176 tons as against 3376 tons, an increase of 2800 tons; and in railroad material, amounting to 21,016 tons as compared with 18,971 tons, an increase of 2045 tons.

In the import list only four classes showed gains, while 15 reflected losses. Cast iron pipe was the only important item showing an increase, rising to 5935 tons from 3765 tons, a gain of 2170 tons. The largest decrease was in semi-finished steel, which dropped 8724 tons to 86,866 tons from 95,590 tons. Imports of hoops declined 6603 tons, to 8946 tons from 15,549 tons; of iron bars, 6076 tons, to 8769 tons from 14,845 tons; of pig iron, 2534 tons, to 7515 tons from 10,049 tons; and of wrought tubes, 1499 tons, to 5361 tons from 6860 tons.

Production of both pig iron and ingots decreased in June when compared with May. The blast furnace output was 563,700 tons, as against 590,500 tons, while steel works production was 709,500 tons as compared with 752,700 tons. At the end of June 141 blast furnaces were blowing, a

decrease of seven under the number in blast at the end of May. The number of open-hearth furnaces in operation increased by one, to 262.

Developments in Iron and Steel in Australia

Expansion and production of iron and steel plants are both reported on by United States Trade Commissioner E. C. Squire, Sydney, Australia, as follows:

Further steps looking toward the formation of the Australian Iron & Steel Co. have been taken by the calling of a meeting of the shareholders of the Hoskins Iron & Steel Co., Ltd., to pass the necessary resolutions for the sale and transfer of the assets of that company to the Australian company.

Extensions costing about £200,000 and consisting of five more rolling mills, a galvanizing plant, and certain other works are planned for the Newcastle Works of John Lysaght's (Australia), Ltd. The addition of this new equipment is expected to increase the productive capacity of this company by 50,000 tons of galvanized and black sheets a year.

Pig iron production by the Broken Hill company during April, the latest month for which returns are available, was considerably below that of the same month of the year previous—production during those two periods being 15,338 tons and 25,310 tons respectively. Steel production during this same month was also reduced by this comparison but to a less marked degree, 20,170 tons being produced in April, 1928, against 28,712 tons in April, 1927. Over the four months ended April 30, this company made 57,143 tons of pig iron (against 112,688 tons during January-April, 1927), and 85,635 tons of steel ingots (107,381 tons).

Hold Mass Production Insecure for Capital and Labor

CAMBRIDGE, ENGLAND, July 4.—That mass production is insecure for both labor and capital because of its dependence upon wide markets, and that social research and scientific management under the joint auspices of labor and employers are needed to give stability to industry and to protect wage earners against those effects of mechanization which are detrimental, was pointed out by speakers from the United States, Great Britain, Germany and other countries at the Congress of the International Industrial Relations Association (for the study and promotion of satisfactory human relations and conditions in industry) which has just completed its five days' discussion of the subject, "Fundamental Human Relationships in Industry," at Cambridge. The congress was attended by personnel managers and welfare

workers, employers, representatives of labor, factory inspectors and research workers from twenty countries. The speakers included: The Rt. Hon. Lord Askwith, K.C.B.; Victor Branford, Sociological Society, London; C. Delisle Burns, lecturer University of Glasgow; Miss Kerstin Hesselgren, inspector of factories and Member of Parliament, Sweden; Paul U. Kellogg, editor *Survey*, New York; Dr. Otto Lipmann, director Institute for Applied Psychology, Berlin; Hans Mars, executive officer, Chamber of Labor, Vienna, Austria; Dr. Charles S. Myers, director National Institute of Industrial Psychology, London;

Maj. L. Urwick, Management Research Groups, London; and Dr. Frieda Wunderlich, Bureau for Social Politics, Berlin. The officers of the International Industrial Relations Association elected for the ensuing three years were: President: C. H. van der Leeuw, partner of de erven de Wed. J. van Nelle, Holland; vice-presidents: Miss M. van Kleeck, Russell Sage Foundation, New York; Miss M. L. Fled-dérus, Holland, and Erich Lübbe, chairman of the works' council Siemens, Ltd., Berlin; treasurer, Charles E. Jacob, managing director, W. & R. Jacob & Co., Ltd., Dublin.

Large Exports of Metal-Working Machinery

Shipments in 1927 Greatest Since 1920—Europe Takes Over Half of Total

WASHINGTON, July 17.—Valued at \$25,379,000, exports of metal-working machinery from the United States in 1927 reached the largest volume in seven years, or since the abnormal year of 1920, according to a statement prepared by S. R. March, Industrial Machinery Division, Department of Commerce. The total of last year exceeded by 35 per cent the exports of 1926 and was greater than such shipments in 1925, which had marked an abrupt increase over previous years.

Mr. March pointed out that the marketing of this large volume of equipment is of especial interest, inasmuch as metal-working machinery is in demand only in those countries which enjoy a certain degree of industrial development. The principal markets for this class of machinery are therefore to be found among the most highly industrialized nations, and consequently among the countries which are the keenest competitors of the United States for the world's metal-working machinery trade.

The outstanding development in the foreign metal-working machinery trade was the gain of \$4,900,000, or 50 per cent, in shipments to Europe. The decline in these exports to Europe in 1926 was responsible for the poorer showing of that year as compared with 1925. This loss has now been more than offset. Europe in 1927 absorbed twice as much American metal-working machinery as in 1924,

and three times the total value of 1923. As a result of these gains, Europe imported last year 57.5 per cent of the total United States exports of this class of machinery, or 6.1 per cent more than in 1926. Latin America, on the other hand, imported only 10.4 per cent, or 4 per cent less than in 1926.

The United Kingdom and Canada continued to be the largest individual markets for United States exports of metal-working machinery. Shipments into these countries increased by more than \$1,000,000 in 1927. Germany, whose purchases fell off about 67 per cent in 1927 from the record purchases of 1925, still imported more than three times as much metal-working machinery in 1927 as in the previous year. Germany's imports, valued at \$3,175,000, compare strikingly with \$77,120 in 1922; \$209,474 in 1923 and \$545,315 in 1924. Imports into France showed a substantial gain over 1926, but did not quite equal those of 1925.

One of the most noteworthy developments in individual markets has taken place in shipments to Soviet Russia in Europe, which amounted to \$1,046,000 in 1927, as compared with \$538,000 in 1926 and only \$930 in 1922. Shipments to both Argentina and Brazil reached record volume and indicate the rapid industrial progress which is developing in those countries. The Philippine Islands likewise imported the largest volume of

metal-working machinery in recent years, exceeding the average for the preceding five years by more than 50 per cent. There were also a few sharp decreases in exports, notably in the cases of Mexico and Chile.

Active Steel Consumption in Japan

WASHINGTON, July 17.—Demand for steel throughout practically the whole of Japan is active, according to a report received by the Iron and Steel Division, Department of Commerce, from Assistant Commercial Attaché J. H. Ehlers, Tokio. The demand is attributed to reconstruction activities in and about Tokio and the general construction in progress in other leading Japanese cities. At the moment, the report said, a large part of the business is going to domestic producers, and is stimulating output. The demand for tin plate, black steel sheets, bars and rods, bolts and nuts and structural shapes was declared to be active with stocks on hand rated as normal, except for black steel sheets, of which the stocks are reported low.

British Iron and Steel Output Dropped in June

LONDON, ENGLAND, July 16 (By Cable).—Production of pig iron in June was 563,700 gross tons, and that of steel, including castings, was 709,500 tons. Both figures represent a decline compared with May output.

A comparison of the June output with that of the five preceding months of the year, and with the monthly rate for previous years is as follows, in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	408,500	296,700
1927—Av. monthly..	607,800	758,200
1928—January	560,600	626,200
1928—February	550,800	764,400
1928—March	592,600	793,300
1928—April	555,000	644,100
1928—May	591,500	752,700
1928—June	563,700	709,500

Mechanical Engineers Meeting at St. Paul and Minneapolis

For the summer meeting of the American Society of Mechanical Engineers to be held at St. Paul and Minneapolis, Aug. 27 to 30, following a cruise of the Great Lakes beginning at Buffalo on Aug. 20, the papers to be read include the following:

The apprentice training program of the Tri-Cities manufacturers by S. M. Brah, and "Does Mass Production Lessen the Need for Trade Skill?" by H. A. Frommelt.

Mechanical engineering in the iron ore industry, by Anton Taneig, and the use of electric power in iron mining, by Allan C. Butterworth.

An investigation of insulated walls, by F. B. Rowley.

Low temperature distillation of low grade fuels, by Max Toltz, modern developments in the coke industry, by A. R. Powell, and mechanical engineering in coal mines, by E. McAuliffe.

Institute of Metals to Meet in Germany

The council of the Institute of Metals has accepted an invitation from the Verein Deutsche Ingenieure and the Deutsche Gesellschaft für Metallkunde to hold next year's autumn meeting of the institute in Germany. The meeting will take place in Düsseldorf. It is expected to prove very attractive not only to British members but also to members resident in Continental countries. The latter often find it difficult to attend meetings in the British Isles but, as was proved on the occasion of the institute's gatherings held in Ghent and Liège, they come freely to meetings held on the Continent. The meeting will be the first to be held in Germany by the Institute of Metals.

National Metal Exposition in October

The National Metal Exposition to be held in Philadelphia the week of Oct. 8 under the auspices of the American Society for Steel Treating promises to prove a fitting companion to the nine previous expositions, says W. H. Eisenman, secretary.

The Detroit Show last year marked a high water point as far as actual space used, which was in the neighborhood of 93,000 sq. ft., while the maximum capacity at Commercial Museum is approximately 80,000 sq. ft. The exposition will cover ferrous and non-ferrous field, heat treating equipment, small tools, machinery, forging equipment, inspection, handling and welding equipment.

Approximately 10,000 sq. ft. will be devoted to an exhibit of welding supplies and equipment. A definite portion of Commercial Museum has been set aside for this feature of the exhibit and is to be carried on in coop-

eration and under the auspices of the American Welding Society, which association will hold its annual fall meeting in Philadelphia the same week as the exposition.

The Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers will again hold its fall meeting at Philadelphia during the same week.

Meetings of New England Foundrymen

The New England Foundrymen's Association was the guest of the Worcester, Mass., members at the July 11 meeting at Edgemere Lodge, Lake Quinsigamond, Worcester. F. F. Newcomb, Pilling & Co., was general chairman of arrangements. H. A. Davis, Freemont Casting Co., Worcester, was in charge of reception arrangements; Harry H. Warner, Arcade Malleable Iron Co., Worcester, took charge of sports; while Richard Powers, R. P. Powers Foundry, Worcester, was in charge of the older members of the organization. Transportation problems were cared for by Harry MacDonald, Reed-Prentice Co., Worcester.

Informal announcement was made during dinner that the August meeting of the association will be held in Providence, R. I., where a shore dinner and sports will be enjoyed. Charles F. Miller, president, and Fred F. Stockwell, secretary, both stated that present plans call for an interesting business meeting at the Exchange Club, Boston, on Wednesday, Sept. 12.

To Study Metallurgy and Coal Mining

Fourteen research studies in coal mining and metallurgy will be carried on during the ensuing college year by the Carnegie Institute of Technology, Pittsburgh. They will be the work respectively, of 11 research fellows, a research engineer, an assistant research engineer and an analyst, all of whom have been appointed by the institute. The research fellows will be candidates for the degree of master of science.

Among the metallurgical subjects will be the cause and control of abnormality in case-carburized steel, formation and identification of inclusions, distribution ratio of iron oxide between slag and metal, method of determining inclusions, viscosity of open-hearth slags, and three studies in plant work relating to the physical chemistry of steel making.

Bituminous coal raised in the week ended July 7—a five-day week—is reported by the United States Bureau of Mines at 6,837,000 net tons. This was at the somewhat lower daily average than for the two preceding weeks. For the calendar year to July 7 the total was 241,126,000 tons, a loss of almost 15 per cent from the same period last year.

Smaller Shipments of Enameled Sheet-Metal Ware

Shipments of enameled sheet-metal ware in May are reported by the Department of Commerce at 384,501 dozens, valued at \$1,304,182. This is the lowest figure since January, comparing with 351,034 dozens in April, valued at \$1,329,929. It represents a considerable increase, however, from a year ago, when the total was 318,071 dozens, valued at \$1,103,693. The May total was greater than any month in 1927, except for February and March. The enameled ware included consists of cooking, household and hospital utensils, having a vitreous coat on a sheet steel or iron base. It does not include equipment such as stoves, heaters, signs, etc.

What the Railroads Did in 1927

Statistics of common carriers for the calendar year 1927 have been issued by the Interstate Commerce Commission in a 28-page pamphlet, going into a great variety of information. Operating revenues for all roads totaled \$5,985,857,014, almost 80 per cent of which was from carriage of freight. Miscellaneous revenues brought the grand total to \$6,134,537,524. Operating expenses aggregated \$4,572,632,285, to which taxes added \$376,090,250. Net operating income was \$1,067,915,340, which represents less than 4½ per cent on the reported investment of \$24,463,367,010.

Revenue freight carried aggregated 2,361,941,419 net tons, of which 97.22 per cent was in carload traffic and 2.78 per cent in less-than-carload freight. Revenue freight originated aggregated 1,281,064,954 tons, of which less-than-carload items accounted for about 3 per cent. The average loading of carload traffic was 35.13 tons to the car.

Paying Men for What They Do

Department heads of the A. O. Smith Corporation, Milwaukee, receive a bonus determined upon the efficiency of their departments. The bonus markings are based on the production, the cost, and the quality of the work. This is found to create a healthy competition among them and also makes the job of foreman a very desirable one.

The result is that all departments are run in an efficient and business-like manner.

The foremen hold monthly meetings at the plant at which addresses are delivered, generally on industrial subjects. A large moving picture machine is available for illustrated lectures. Special efforts are made to foster a friendly feeling among the foremen and between the foreman and the workmen.

To Appraise Obsolescence of Machinery

Department of Commerce to Study Conditions Affecting Cost-Accounting Allowance for This Factor

WASHINGTON, July 17.—Determination of the amount of obsolete industrial equipment, and its importance as a factor in the inability of firms manufacturing similar products to compete on an equally profitable basis, is one of the objectives of a requested survey to be undertaken by the Department of Commerce. It will be conducted under the immediate direction of H. C. Dunn. Replacement of machinery which in point of service may have many years of usefulness, but which in point of satisfying the latest fancies of the consumer market is obsolete, is an important matter for the manufacturers and one which is behind the request for the study, said Mr. Dunn. A sample survey will first be made to develop the plan of procedure and to learn what obstacles must be overcome.

Obsolescence merits a definite understanding, Mr. Dunn pointed out, especially that it may not be confused with depreciation. It was explained that the obsolescence of factory equipment is effected largely by style changes or by the new product of inventive genius, and not by wear and tear, which are factors in depreciation.

To distinguish between obsolescence and depreciation, and to explain the object and plans for the industrial equipment survey, Mr. Dunn made the following statement:

The practical value of this study would probably be a truer accounting for obsolescence as a hazard, rather than an arbitrary compromise with depreciation, as at present. Wear and tear, or depreciation, is a scientific measurement and can be determined accurately in cost accounting. Obsolescence is analogous to fire as a risk. It cannot be predetermined any more than the date a building will burn can be determined. An arbitrary basis of accounting for the two factors does justice to neither, and fails in adequately providing a fund for replacing machinery when its value has been destroyed by its being worn out or rendered obsolete.

If obsolescence is defined as representing the deadline beyond which a machine cannot compete profitably with another machine, none of the machine's value is destroyed until the deadline is reached; then the value is destroyed all at once. Depreciation approaches its deadline by gradual and constantly diminishing value. Therefore, the two cannot accurately be confused.

Natural caution and conservatism prompts us to hang on to methods and equipment long after the period of their greatest usefulness or profitableness is ended. Facts and information are probably the greatest factors for providing the assurance and courage necessary to discard the obsolete and inaugurate the new. At present, no facts or information seem available to the public generally.

Some of the more ingeniously managed concerns have data and policies concerning obsolescence, but this only accentuates the inability of others to continue

satisfactory profits. The market price established by the most efficient is a difficult goal for the less efficient to achieve. Probably the most stabilizing and most profitable competitive condition is when all are as efficient as the most efficient. Therefore, whatever can be done to approach this end should have practical value.

South America Large Buyer of Airplanes

WASHINGTON, July 17.—Almost one-third of the American exports of aeronautical products goes to South America, considered the most potential market for aviation sales by the Transportation Division, Department of Commerce. In the past three years South America has bought \$1,204,585 worth, or 32 per cent of the \$3,715,000 of United States aviation products shipped abroad. Argentina, one of the important markets for American aeronautical products, bought \$246,000 worth in the past three years, including 32 airplanes, valued at \$215,037. Peru, however, far exceeded Argentina's purchases in the past few years. From 1925 through 1927 it imported a total of \$468,871 worth of American aircraft products, including 15 planes, valued at \$280,196. Chile has imported \$278,518 worth of American aircraft products, including eight planes, valued at \$215,500. Brazil has bought \$90,628 worth the past three years, including 12 planes, valued at \$78,264, and Colombia has purchased \$114,275 worth, including four planes at \$97,769. Bolivia and Venezuela are other good South American markets.

Ore Shipments Low for Year but June Cargoes Gain

Shipments of iron ore from the Lake Superior region totaled 8,926,216 tons in June, a gain of 467,350 tons, or more than 5 per cent above the 8,458,866 tons shipped from upper Lake ports in June, 1927. However, the total for the season to July 1 fell off 3,476,298 tons, or nearly 20 per cent compared with the 17,-

771,423 tons shipped up to July 1, last year. Shipments by ports and for the season in 1928 and 1927 have been as shown below, in gross tons.

American Shipping Losing Ground

Net tonnage of American ships entering American ports with cargo in April is reported by the Department of Commerce at 1,611,729, a reduction of almost 20 per cent from April, 1927, when 1,979,195 tons entered. Practically all of this tonnage loss of American ships was made up by gains in foreign tonnage entering American ports with cargo. A year ago the figure was 2,515,588, which now has become 2,831,673, or an increase of 12 per cent. The foreign tonnage last year was less than 56 per cent of the total. This year it is 63½ per cent of the aggregate.

Metal-Working Plants Use More Electricity

Steel plants used 4.2 per cent more electric energy in June than a year earlier, and other metal-working plants reported an increase of 17.2 per cent, according to figures compiled by *Electric World*. Automobile manufacturing plants showed a gain of 31.4 per cent, the largeness of which was due in considerable measure to the fact that the Ford plant was practically out of operation a year ago. Textile and lumber plants, on the other hand, were operating below the figure of June, 1927, by 11.9 and 3.7 per cent respectively. Taken as a whole, manufacturing plants showed a gain of 3.5 per cent over June, 1927, but a reduction of 2.2 per cent under May, 1928.

For the first half of the year the index is given for all industrial groups at 119.8, compared with 116.5 in the first half of 1927. The metal industries group for the first half shows 124.2 against 116.3 last year; rolling mills and steel plants, 126.8 against 112.6 last year; other metal-working plants, both ferrous and non-ferrous, 121.7 against 109.6 last year. Automobile plants for the first half show 141.9 against 110.9, while shipbuilding plants record a heavy reduction, having only 88.5 this year against 127 last year.

MOVEMENT OF LAKE SUPERIOR ORE

Port	June, 1928	June, 1927	To July 1	
			1928	1927
Escanaba	831,478	928,471	1,468,202	1,862,299
Marquette	558,212	459,315	875,248	930,628
Ashland	1,235,019	1,113,151	1,868,775	2,309,186
Superior	2,423,990	2,325,965	3,953,793	4,822,434
Duluth	2,899,024	2,718,446	4,568,912	5,893,872
Two Harbors	978,493	913,518	1,560,195	1,953,004
Total	8,926,216	8,458,866	14,295,125	17,771,423
Increase	467,350			
Decrease			3,476,298	

Notable Activity in New England

The New Britain Machine Co., New Britain, Conn., is operating its special machine and machine tool departments on a day and night schedule. Practically 50 per cent of the plant is operating on such a basis. The company has a comfortable backlog of orders, largely from the automobile industry.

The Chapman Valve Mfg. Co., Springfield, Mass., reports more business the first five months of this year than in the last five months of 1927, and indications are 1928's turnover will be as large and probably larger than 1927's. Competition is more severe than it was in the immediate past, with no proportionate decrease in costs.

The Coburn Trolley Track Mfg. Co., Holyoke, Mass., is operating at about 50 per cent of capacity with business prospects somewhat better than they were the first four or five months of this year. Customers are buying conservatively. No material change in prices for their product is anticipated. A few items have advanced slightly, and a few are lower.

E. P. Bullard, president Bullard Machine Tool Co., Bridgeport, Conn., states that the company did more business during the first half of 1928 than in the whole of 1927. The company is pushing sales of new machines, and is buying new machine tool equipment. It has sufficient business on its books today to keep the plant running at capacity the remainder of 1928.

To Dismantle Four Blast Furnaces

YOUNGSTOWN, July 17. — To save taxes and reduce maintenance, the Youngstown Sheet & Tube Co. is to dismantle two blast furnaces and its by-product coke works at Mayville, Wis. The Tod blast furnace at the Brier Hill works, Youngstown, built in 1889 by the old Youngstown Steel Co., is to be torn down, while one of the blast furnaces in the South Chicago battery is also to be demolished, both because of obsolescence. This will leave the company two stacks at South Chicago and a total of 14 at all points. When the two blast furnaces at Mayville are operated, coke will be secured from nearby producers.

Last week, officials and directors of the company conducted a three-days inspection of the Sheet & Tube properties, headed by President James A. Campbell. Improvements now under way are progressing satisfactorily, it was ascertained, including the new by-product coke plant installation at South Chicago and the new boiler and power plant at the Campbell works.

President Campbell predicted increased operations and larger employment, following the trip. Those who participated included Vice-Presidents H. G. Dalton, Cleveland; W. C. Reilly, Walter E. Watson, C. S. Robinson and W. J. Morris, Youngstown;

Walter E. Meub, secretary-treasurer; and the following directors: Harry Coulby, Cleveland, A. E. Adams, Richard Garlick, John Tod and John W. Ford, Youngstown.

Recent steel buying has been satisfactory, making the fall outlook favorable, says President Campbell. Second-quarter earnings will be slightly better than those for first quarter. The company's tin mills at Indiana Harbor have been operating in full for some time and it is showing good earnings from its zinc properties.

Bin Improvements for Joliet Blast Furnaces

A new stock house and material handling system will be erected by the Illinois Steel Co. at its Nos. 3 and 4 blast furnaces at Joliet, Ill. The stock trestle and bin structure will be approximately 400 ft. long and will include two coke bins and 39 ore and stone bins of the Baker suspension type, equipped with McKee special continuous opening segmental hand operated gates. Three larry cars of late design will also be provided. The contract for the extensions and equipment has been awarded to Arthur G. McKee & Co., engineers and contractors, Cleveland.

Employment High in June in Ohio

With the one exception of March, 1928, employment in the iron and steel industries of Ohio during June was the greatest since November, 1926, the index figure standing at 102, with an average month in 1923 taken as 100. The number of wage earners increased 1 per cent from May and 6 per cent from June, 1927, the betterment being shared by 30 of the 58 reporting companies. In Cleveland employment was 10 per cent greater than in May and 38 per cent greater than in June, 1927. In the machinery group June employment was the highest since May, 1927, and was 2 per cent greater than in May. The increase was shared by 103 of the 190 reporting concerns. These figures are taken from the current issue of the bulletin published by the Bureau of Business Research of Ohio State University.

New General Electric Co. Protective Cream

The research laboratories of the General Electric Co. have developed a protective hand cream for hands and arms which are exposed to oil, grease, dirt, varnish, paint and other causes of skin discoloration and irritation encountered in industrial processes. It is applied before beginning work and forms an invisible film which quickly dries and is not slippery. Subsequent washing in warm water removes the film. The cream has been placed on the market by the merchandise department of the company at Bridgeport.

Disston Company to Consolidate Subsidiaries

Plans are being arranged by Henry Disston & Sons, Inc., Tacony, Philadelphia, for a consolidation of its manufacturing subsidiaries into one organization of enlarged proportions, under first noted name. The amalgamation will include Henry Disston & Sons Iron & Steel Works and Henry Disston & Sons File Co. The succeeding organization, Henry Disston & Sons, Inc., will carry out an increase in capital from \$6,000,000 to \$10,000,000, to provide in part for consolidation and expansion. A meeting of stockholders has been called for Sept. 14, to approve the proposition.

Heavier Production of Portland Cement

Portland cement production in June is reported by the United States Bureau of Mines at 17,469,000 bbl., a gain of 1 per cent over the May figure of 17,280,000 bbl. and a similar gain over June, 1927, when production was 17,224,000 bbl. While the June production was the highest for that month ever recorded, it falls short of the high figures of August and September of last year, standing third in all the months we have had.

Shipments in June fell 3 per cent below the preceding month, having been 18,421,000 bbl. against 18,986,000 bbl. in May. The current figure is 7 per cent lower than that for June last year, when shipments amounted to 19,761,000 bbl., and was lower also than the 19,134,000 bbl. of June, 1926. For the first half-year, production of cement has aggregated 77,005,000 bbl., compared with 75,058,000 bbl. last year. A new record has been made, therefore, as no previous half-year reached the totals now recorded.

Reduction in Trackwork Output

Production of trackwork for T-rail track of 60 lb. and up is reported for June by the American Iron and Steel Institute at 13,716 net tons. This represents a reduction of about 3 per cent from the total for May, at 14,141 tons, and it is nearly 6 per cent below the figure for June, 1927, at 14,557 tons. Except for May and March, however, the June total is the highest since June, 1927.

Aggregate production for the second quarter of the year was 41,368 tons. This is the largest total since the corresponding quarter of last year, at 48,406 tons. For the first quarter of this year the amount was 35,761 tons.

The J. M. Carpenter Tap & Die Co., Pawtucket, R. I., has passed out of existence, and a new corporation under the same name incorporated. The original company is now known as the Carpenter Holding Co. Elisha C. Mowry is president.

Fabricated Structural Steel

New York Subways Will Take 15,000 Tons—13,000 Tons Placed for Manhattan Office Building

FOR the third consecutive week awards of fabricated structural steel totaled more than 42,000 tons, lettings during the past seven days having just passed this figure. Outstanding awards were office buildings in New York and Baltimore, taking 13,000 and 7700 tons respectively, and a 3000-ton theater job in Atlantic City. Including 15,000 tons needed for two sections of the New York subway, new projects amounted to 36,700 tons. Other large projects reported were a Milwaukee office building calling for 4000 tons and a municipal drainage project at Oakland, Cal., requiring 4500 tons of plates. Awards follow:

BOSTON & MAINE RAILROAD, 2300 tons, bridges at Saco and Biddeford, Me., and Haverhill, Mass., to Phoenix Bridge Co.

BOSTON & MAINE RAILROAD, 800 tons, bridge at Salmon Falls, Me., to Boston Bridge Works.

PITTSFIELD, MASS., 125 tons, bridge, to Palmer Steel Co.

BOSTON, 165 tons, office building at 8 Newbury Street, to New England Structural Co.

NEW YORK, 13,000 tons, Western Union Building, to Post & McCord, Inc.

NEW YORK, 2300 tons, office building on John Street for New Amsterdam Casualty Co., to Taylor-Fichter Steel Construction Co.

NEW YORK, 500 tons, building in Bronx for Borden's Farm Products Co., to National Bridge Works.

PENNSYLVANIA RAILROAD, 700 tons, freight station at Trenton, N. J., to Belmont Iron Works.

PHILADELPHIA, 800 tons, St. Luke's Hospital, to Montgomery Iron & Steel Co.

PHILADELPHIA, 1000 tons, insurance building at Fourth and Walnut Streets, to American Bridge Co.

ATLANTIC CITY, N. J., 3000 tons, Embassy Theater, to an unnamed fabricator.

BALTIMORE, 7700 tons, building for Baltimore Trust Co., to McClintic-Marshall Co.

WASHINGTON, 250 tons, train shed for Pennsylvania Railroad, to unnamed local company.

WATERVILLE, N. C., 485 tons, Phoenix Utility Co., to Virginia Bridge & Iron Co.

BIRMINGHAM, 177 tons, Seaboard Air Line Railroad, to Virginia Bridge & Iron Co.

BIRMINGHAM, 168 tons, slag bin for Sloss-Sheffield Steel & Iron Co., to Virginia Bridge & Iron Co.

MIAMI, FLA., 100 tons, airplane hangar, to Ingalls Iron Works Co.

BATON ROUGE, LA., 700 tons, Standard Oil Co., to Virginia Bridge & Iron Co.

BUFFALO, 400 tons, Mayflower apartment building, to Kellogg Structural Steel Co.

NEW YORK CENTRAL RAILROAD, 300 tons, bridge at South Bend, Ind., to McClintic-Marshall Co.

CHICAGO, 150 tons, building for Dallas Copper & Brass Co., to Gage Structural Steel Co., local.

CHICAGO, 525 tons, building for Robert O. Law, to Mississippi Valley Structural Steel Co.

CHICAGO, 1000 tons, two public schools, to Eggers Schillow Co., local.

CHICAGO, 200 tons, Interstate Iron & Steel Co., plant addition, to American Bridge Co.

MARINETTE, WIS., 850 tons, Interstate bridge over Menominee River, to Wisconsin Bridge & Iron Co.

KOHLER, WIS., 500 tons, dry kiln addition to pottery plant of Kohler Co., to Worden-Allen Co.

KEWAUNEE, ILL., 500 tons, boiler house for Kewaunee Boiler Co., to Worden-Allen Co.

NEKOOSA, WIS., 125 tons, finishing room for Nekoosa-Edwards Paper Co., to Lakeside Bridge & Steel Co.

GREEN BAY, WIS., 750 tons for Northern Paper Mills, to Worden-Allen Co.

SAN FRANCISCO, 275 tons, A. M. Castle Co. warehouse, to Pacific Coast Engineering Co.

SAN FRANCISCO, 120 tons, apartment building on Pacific and Webster Streets, to McClintic-Marshall Co.

OAKLAND, CAL., 350 tons, apartment building on Lakeshore Boulevard, to Herrick Iron Works.

OROVILLE, CAL., 450 tons, Lincoln and Huntoon Street viaducts for Western Pacific Railroad Co., to unnamed Eastern fabricator.

ALAMEDA, CAL., 120 tons, hangars for Alameda Airport Co., to Herrick Iron Works.

SACRAMENTO, CAL., 100 tons plates, 24-in. riveted pipe line for city, to unnamed pipe fabricator.

SANTA BARBARA, CAL., 125 tons, church, to McClintic-Marshall Co.

SAN BERNARDINO, CAL., 125 tons, Pioneer Trust & Savings Bank Building, to Union Iron Works.

LOS ANGELES, 138 tons, apartment building at 840 South Hobart Street, to Philip Freidman & Son.

LOS ANGELES, 250 tons, apartment building at Franklin and Gramercy Place, to Pacific Iron & Steel Co.

RENO, NEV., 106 tons, Odd Fellows' lodge, to Schrader Iron Works.

PHOENIX, ARIZ., 175 tons, city hall, to Minneapolis Steel & Machinery Co.

MANILA, P. I., 120 tons, apartment building, to Judson-Pacific Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

WEYMOUTH, MASS., 525 tons, power house addition.

CAMBRIDGE, MASS., 225 tons, hospital addition.

LAWRENCE, MASS., 150 tons, Champion International Co. power house.

NORTHFIELD, VT., 225 tons, Norwich University armory.

DURHAM, N. H., 250 tons, chemistry building.

PROVIDENCE, R. I., 1200 tons, Washington Bridge; Merritt-Chapman & Scott Corporation, New York, general contractor.

NEW YORK, 15,000 tons, subway work; 4000 tons for section 1-A, route 8 and 11,000 tons for section 1, route 108.

STATE OF NEW JERSEY, 400 tons, highway bridges.

PENNSYLVANIA RAILROAD, 300 tons, bridges.

AKRON, OHIO, 500 tons, East Center bridge, probably will be awarded to Burger Iron Co.

INDIANAPOLIS, 1200 tons, Methodist Hospital.

INDIANAPOLIS, 350 tons, plant building for Link-Belt Co.

CHICAGO, 1850 tons, five junior high schools for Board of Education.

MILWAUKEE, 2500 tons, A. O. Smith Corporation pipe shop; bids to be let this week.

MILWAUKEE, 200 tons, addition for International Harvester Co.; bids close July 23.

MILWAUKEE, 4000 tons, addition to building for Northwestern Mutual Life Insurance Co.

ST. LOUIS, 700 tons, plant for Century Electric Co.

LINCOLN, NEB., 200 tons, Nurses' home; bids in.

SAN FRANCISCO, 200 tons, shapes and rail steel for vault at United States mint; bids being taken.

SAN FRANCISCO, 600 tons, apartment building at 2160 Pacific Street; bids being taken.

OAKLAND, CAL., 4500 tons of plates for East Bay Municipal Utility District; bids Aug. 17.

SANTA CLARA, CAL., 140 tons, bridge at Sargent; bids Aug. 1.

SACRAMENTO, CAL., 455 tons, bridge at Saugus; bids Aug. 1.

VENTURA, CAL., 570 tons, Barsdale bridge; bids July 24.

SAN DIEGO, CAL., 253 tons, bridge over Sweetwater River; bids July 16.

SEATTLE, 195 tons, Second Avenue viaduct extension; bids July 27.

New Trade Publications

Boiler Return Trap.—Vapor Heating Co., York, Pa. Four-page bulletin, B-139, describing and illustrating the new Broomell direct boiler return trap for vapor pressure, vapor vacuum and one or two-pipe systems of steam heating on which the return ends of radiators are equipped with thermostatic traps, operating at 20 lb. boiler pressure or less. Simplicity of construction is a feature. The operating mechanism is inside the body of the trap, above the water line. Inlet and vent ports are non-corrosive, and are positioned so that they will not gather foreign matter. The device is entirely automatic and a pump is not required. It may be used in correcting defective straight steam jobs and in connection with pressure reducing valves when the boiler pressure does not exceed 20 lb.

Electric Motors.—Wagner Electric Corporation, St. Louis. Bulletin No. 156, describing the sleeve bearing and the ball bearing construction used on Wagner motors. The sleeve bearings are completely sealed against dust and dirt and the ball bearing is of double cap type, to facilitate replacement and servicing.

Presses.—Niagara Machine & Tool Works, Buffalo, N. Y. Bulletin No. 64-C, 44 pages, devoted to the series No. 60 double crank power presses. Features of construction are described and illustrated and specifications on all types are given. A section is also devoted to modifications and special features of these machines. Foot presses and screw presses made by the company are described in bulletin No. 68, also recently issued.

ESTABLISHED 1855

Cross Currents in Steel

OUR next annual presentation of where steel went, in the year now half passed, is going to prove very interesting, for there have been various cross currents. It is a matter of statistical record that ingot production in the first half of this year ran 3 per cent above that in the corresponding period of 1926, the record year; but by no means does this indicate that the various consuming lines each made a similar showing. There were some substantial losses and there were some still larger gains. Passing lightly over 1927, which was badly off in its second half, though almost matching 1926 in its first half steel production, comparisons may be made between 1926 and this year to date.

There have been material decreases in consumption of steel by the railroads and in the oil and gas fields. The highest railroad percentage of total steel consumption in the six years covered by the diagram in THE IRON AGE, Jan. 5, 1928, page 6, was 28 per cent, in 1924, but the tonnage had been greater in 1923. Then there was 25 per cent in 1925, 23½ per cent in 1926 and 19 per cent in 1927. There are chances of the proportion running under 19 per cent this year.

Oil, gas, water and mining were shown at 9½ per cent for 1926 and 8½ per cent for 1927. There was much drilling in 1926 and little in 1927, but a great deal of line pipe work. There is little drilling this year and there was little line pipe business until a few weeks ago. The general proportion seems likely to drop somewhat.

Agriculture's consumption of steel has moved, broadly speaking, in the opposite direction from railroad consumption, for it was only 3 per cent of 1924's light production of steel, increasing to 3½ per cent and then 4 per cent in the next two years of increasing steel totals, while last year it was 5½ per cent. For this year we may expect a still larger percentage.

Automobile and truck production to date is only slightly behind 1926 and there are good chances of the difference being made up. The proportion will not differ greatly from the 14½ per cent reported for 1926.

Each year since 1922 has shown an increase in the proportion of steel passing into building construction, there being a slight backset in percentage though not in tonnage in 1925. The proportion was 15 per cent in 1922 and 22 per cent last year. All the indications are that this year's percentage will show a further increase. Undoubtedly the ratio of steel to total of building operations has been gaining in a very substantial way.

With changes in the distribution of steel to different consuming lines, the industry has no difficulty in putting its steel into the respective finished forms called for, despite the fact that mill equipment is highly specialized. Steel ingots were produced during the first half of this year at 84 per cent of rated capacity, which is a high proportion; but no finishing department was strained, for the sum total of finishing capacity well exceeds the total ingot capacity.

There is no likelihood of any individual finished steel product becoming scarce, but when such changes are seen in the relative requirements of different consuming lines one wonders what things would be like if all the consuming lines should chance to do their best in the same year. Competition makes the gap between total demand and total capacity seem large, but the statistics do not. A 16 per cent margin cannot be called large, generally speaking, yet it is sufficient to keep prices from working into a position that could fairly be described as firm, in the old-time sense.

From Servants to Services

POPULAR writers like to measure modern mechanical power in terms of millions of slaves. The days of slavery are over and, in this country, the era of cheap servants is past. Mass production, by providing at low cost devices which minister to personal comfort and pleasure, has eliminated to a large extent the need for a serving class.

Growing efficiency in manufacture reduces the number of workers required for a given output, creating "technological" unemployment. Employees released by industry are being absorbed in other pursuits, notably luxury industries and the purveying of personal services. In the new sense service consists essentially of organized or wholesale methods of satisfying wants, in contrast with the individual attention rendered by household servants. In the cities apartment hotels relieve their occupants of all the cares of housekeeping, supplying maid and valet service and restaurants. Laundries, hair-dressers' shops, tea rooms, delicatessen shops and cleaning and pressing services are all increasingly used as people become better able to rid themselves of household drudgery. Likewise automobile laundries, repair shops and service stations are doing for the motorist what he formerly did for himself.

A kindred development of the times is the demand for more service in the distribution of products. Packaging, quick delivery in small quantities and other demands made upon the retailer increase the

cost of distribution but add to the convenience or desirability of commodities. According to Magnus W. Alexander, president of the National Industrial Conference Board, this form of service becomes in essence a refinement of the product.

The growth of services, although in many cases resulting in higher costs, does not necessarily mean economic waste. It rather signifies greater specialization in occupations, allowing the individual more time for his own vocation or for leisure and avocations. While there may be disagreement as to what properly are services as distinguished from extravagances, there can be no doubt that they betoken a rising standard of living. Mass output has not only helped solve the servant problem, but it has also made possible a wider enjoyment of organized services and brought to increasing numbers of people some of the best material satisfactions of life.

"Go South, Young Man, Go South"

"COMPANY towns," "mill towns" and coal mining camps are all too frequently aggregations of unkempt shanties, and the inhabitants gradually acquire the same state of dishevelment. Of course there are exceptions and fortunately their number is growing. In all industries and in all States are model towns which must be the envy of their neighbors and undoubtedly attract the highest type of residents. In this way the practical philanthropy behind the town-planning scheme reaps handsome dividends in a decreased labor turnover, a better-than-average skill throughout the working force, and a cheerfulness and contentment which comes from good home surroundings.

Of course, the danger of paternalism must be avoided. But it is apparent to anyone who travels through the newly developing region in North Carolina that a safe middle course can be steered. Here are dozens of little communities, each containing several hundred cottages, clustering about a spinning or a weaving plant. Nature is kind, and only a little effort is needed to adorn the premises with flowers, shrubs and shady arbors. While some of the villages are so new the first coat of paint has hardly been weather-beaten, yet the general impression given by all of them is one of thrift, cleanliness and wholesome living.

A new name should be invented for them. They are so much different from the "mill towns" of New England that the term does not apply. It would be like putting a rose bud and a cockle burr in the same classification.

Freight Car Buying—When?

AT intervals in the years just after the war, car builders gave out estimates of the rate at which the railroads would need to place equipment orders if they were to make up for the running down of their properties under Government control. In the fall of 1924 the country was full of prophecies of prosperity, in view of the approval of the Coolidge administration at the national election. As their contribution to the favorable forecasts, the car companies at that time said that the railroads should buy not less than 200,000 cars a year in the next five years to bring their rolling stock up to standard in freight-moving capacity.

The 1924 prophecies of business activity on a large

scale have come true in the past four years, and in the expeditious handling of the large volume of freight the railroads have made a record to which their spokesmen have pointed with proper pride and on which business reviews have commented again and again. But far from making up for their under-buying in the years of Government operation, the railroads have been but poor patrons of the equipment companies.

In the three years following 1924 the total of freight cars built for domestic use was about 258,000, or an average of 86,000, little more than 40 per cent of the estimated annual requirement of 200,000 cars, and a trifle less than the average of 87,650 cars built in the five years preceding 1924. Among all the years since the war 1923, with a total of 175,748 freight cars built, stands alone in making any close approach to the 200,000-car average of the car builders' forecast of late 1924. Since 1923, as shown by the following figures of *Railway Age*, there has been a steady decline in freight car building, especially marked in 1926 and 1927:

Freight Cars Built for Domestic Lines

1919	94,981	1924	113,761
1920	60,955	1925	105,935
1921	40,292	1926	88,862
1922	66,289	1927	63,390
1923	175,748		

Somewhere an upward turn, in compensation for the lean buying of so many years, is to be looked for; but 1928 has been without any indication of it thus far. Roundly, new freight cars ordered in the past six months were 28,000, as against 42,000 in the first six months of 1927. The record of cars placed in service this year makes even a less favorable showing. For the five months ended May 31, this number was only 21,873, whereas the first five-months' average for the four years 1924-27, as given by *Railway Age*, was 48,800.

The steel industry has one satisfaction from such a showing: Having fared so well this year at the hands of buyers other than railroads, and on a scale that in these other lines gives better promise for the second half than existed a year ago, the inevitable change for the better in railroad demand, should it come this year, will make the round-up for 1928 appreciably better than the best predictions of six months ago.

Steel's Recuperative Powers

A CHARACTERISTIC of the steel industry is so familiar that it may not be identified—its power of recuperation. Often one has heard of a trade or a market going from bad to worse. Steel never does that for any length of time. Always it has recuperated. Its long history has been one of repeated recuperation. It has had its downs and ups, but the latter have always been the greater.

Steel producers themselves have always been noted for optimism. Perhaps that is due largely to the fact that the industry is of such a character as to attract to its ranks men born with sanguine temperament. One of the greatest of these was Andrew Carnegie, and it is no slight to his memory to point out an instance where even he apparently failed to make full allowance for steel's recuperative power. In 1898, on the eve of his departure for an Egyptian trip (his wont was

to talk about business on leaving the country rather than on arriving), he predicted a great tonnage future for steel because it could be sold three pounds for two cents, meaning \$15 billets, whereas in the next year billets sold for \$40 and scrap rails brought more than the cost of the new rails contracted for in the previous year. The steel industry had seemed overbuilt, promising success only to the lowest cost producers, for in the same interview Mr. Carnegie intimated that no concern with bonded indebtedness stood much chance. Afterward he became quite a bondholder himself.

We need not trace the ups and downs that have come since, in both tonnage and prices. Times change, and styles with them, but the power of recuperation in steel remains. What is to the point is to observe how the principle has been working out in recent months in a new way befitting these new times. In the last quarter of last year steel earnings were very poor. Tonnage was light and prices were too poor to yield an adequate return even on a reasonably full tonnage. Things seemed to be going from bad to worse; but promptly tonnage increased. Last year showed the poorest fourth quarter production of steel since 1921, and now this year has shown the largest first half production on record.

At the same time steel prices improved. The hasty opinion would be that they improved purely because tonnage had increased, and later, say on April 1, there were those who judged that the whole thing made a poor showing, by a reasoning that the price improvement was not commensurate with the tonnage improvement, from which it would seem to follow that when tonnage went the other way prices would go the other way still faster.

What the trade has since been permitted to see does not support that view. Steel prices have stood the test of seasonal decline in demand better than those observers expected. Sellers have shown greater ability to hold their prices than their conduct in fair weather had suggested. Confronted by a real emergency, the industry rises to the occasion. It does not secure in the long run what would seem to be a reasonable return on its investment; yet it is always fully capable of keeping out of serious trouble.

Bond Between Slag and Cements

In addition to the four pamphlets issued by the National Slag Association, 937 Leader Building, Cleveland, containing information on various properties of iron blast furnace slag, noted on page 98 of *THE IRON AGE* for July 12, a fifth has just appeared entitled "Bond in Slag and Slag Concrete." It contains 28 pages of quotations from published articles or addresses, each excerpt giving testimony about the way crushed or granulated slag unites with cement, tar, bitumen, or other road-making materials. The pamphlet will answer questions properly asked by engineers or constructors when first considering the use of slag for concrete aggregate or for road building.

Wholesale prices from 1890 to 1926 are covered in a 256-page publication (No. 440) of the United States Bureau of Labor Statistics. Copies may be obtained at 60c. from the Superintendent of Documents, Government Printing Office, Washington. Figures are given for a wide variety of products on an annual basis for the entire period, and month by month through 1925 and 1926. The principal items are shown also in graphic form over a number of years.

CORRESPONDENCE

Tracing Billets Through Marks on Ingots

To the Editor: Some time ago we made an effort to find a method of marking ingots which would carry through into a 4 x 4-in. billet in such manner that the mark would still be legible. It was important to have this result in identifying steel running through the mill. Various types of paint were used without satisfactory results; the mark was not sufficiently legible after the billet was rolled. A special composition crayon was developed which showed considerable improvement over the paint, but still was not entirely satisfactory.

Someone told me of a case where a small electrically-driven saw is used to make certain marks on the ingots. It was said that these marks are visible after the finished bar is on the hotbed. For steel which is subject to rigid surface inspection, however, I should think that these sawmarks would leave a flaw which could not be permitted. Also it would seem to me that there would be only a limited number of bars possible under this arrangement, because not very many sawmarks could be placed on successive ingots before the different kinds of sawmarks would run out. They might follow the Roman numerals to a certain extent, I suppose.

I wonder if any of your readers can tell of a satisfactory method by which the ingots can be marked so that the identification on the hotbed is positive and without detriment to the quality of the steel.

N. S. Y.

Bureau of Mines Studies Ferrous Oxide

Ferrous oxide (FeO) is assumed to be the constituent of so many smelting slags, and to have such important effects upon the quality of pig iron and steel that the Pacific Experiment Station of the United States Bureau of Mines has endeavored to prepare a quantity of it for more thorough examination. Previous experimenters apparently have secured no more than 0.1 gm. The oxide, which is stable at high temperatures, becomes unstable at 500 to 600 deg. C., and even though chilled rapidly through this range, does not retain the desired composition.

To date the best results have been secured by melting magnetite with pure iron in a specially designed vacuum furnace, and chilling rapidly out of contact with air. Even this treatment gives a mass which analyzes no more than 85 per cent FeO.

Index of Steel Treaters' Transactions

A 100-page index of Vol. 1 to 10 (1920 to 1926), of the Transactions of the American Society for Steel Treating, and including Vol. 1 and 2 of the Journal of the American Steel Treaters' Society, has been prepared by Frank T. Sisco of the Army Air Corps and published by the society. The subject matter of these 12 volumes is elaborately cross indexed into more than 12,000 entries. Copies may be obtained from the society, 4600 Prospect Avenue, Cleveland, for \$3.

The 1927 Yearbook of the Merchants' Association of New York has been issued in a volume of 343 pages. It covers not only the classified list of 6667 members arranged by type of product, and also in the regular alphabetical list, but features as well the activities of the year in a wide variety of lines. Committee reports cover about 100 pages and deal with such topics as banking, building laws, city planning and transit, street traffic, fire prevention, foreign trade and customs service, harbors and terminals, industrial relations, insurance, public utilities, and transportation.

This Issue in Brief

"A manufacturing concern can be successful only through an unceasing process of growth," says engineer. Well-managed firms are investing a relatively large portion of profits in improved methods, modern equipment and research, rather than paying high dividends.—Page 144.

* * *

Wide aisles permit motor trucks to drive into the factory and deliver parts directly to assembly lines. In this way automobile manufacturer, who has done away with stockrooms, avoids rehandling.—Page 135.

* * *

Abrasion test will enable you to determine how metal parts will stand up in service. By means of an accurately controlled grinding mechanism, in which all conditions as to abrasive, pressure, speed, time and moisture are under operator's control, laboratory tests are obtained which give a reliable index of service qualities.—Page 141.

* * *

From priming coat to completion, enameled parts are untouched by workmen. Continuous enameling conveyor carries automobile parts, from priming tank, through a continuous oven, where the priming coat is baked on. Operation is repeated with a coat of enamel, then parts are inspected and delivered to assembly line.—Page 138.

* * *

Accuracy of analyses for determination of gas in metal is proved by tests of same specimen in three different countries. Analyses of uniform samples of ingot iron, analyzed for oxygen and hydrogen, in United States, Germany and England, produce comparable results.—Page 142.

High operating efficiency and low accident rate go together. Investigator finds that material reductions in accident rates can be had with greater production. Accident rate can be controlled, and in fact it varies less than rate of production per man-hour.—Page 151.

* * *

In designing rolls, the main point of consideration is the temperature of the ingot or billet, as this determines the softness of the metal. Relative sizes of the passes are determined by the comparative plasticity of the metals at rolling temperatures, and not by their hardness or other physical properties when cold.—Page 146.

* * *

Can foundries reduce coke consumption by cooling the reduction zone in cupola? A German foundry claims a considerable reduction in fuel costs by introducing a water spray. This diminishes the formation of carbon monoxide, which is detrimental to economy.—Page 148.

* * *

Forging manufacturer assembles his own furnaces from standard units. From a few sizes of bed, side and end plates, furnaces of varying dimensions are quickly assembled, using tie rod construction and mounting on pipe standards. Instead of being round, burner port is flat, creating a fan-like sheet of flame.—Page 149.

* * *

Where manufacturers fail to obtain adequate profits, how great a factor is obsolete equipment? Department of Commerce will undertake a survey to answer this question. "Natural caution and conservatism prompts us to hang on to methods and equipment long after the period of their greatest usefulness or profitableness is ended," says Department executive.—Page 165.

Where lubrication cannot be maintained, high-lead bronzes show decided advantages. Bronzes with 12 to 25 per cent lead do not wear so rapidly as low-lead bronzes, without lubrication.—Page 142.

* * *

Almost infallible barometer of pig iron prices is described by Doctor Haney. Ratio of pig iron production to steel ingot production, taking into consideration the level of steel prices, reveals the condition of the pig iron market. When the ratio is high, as at present, pig iron is weak in price.—Page 160.

* * *

Demand for steel equals production. Though output is high, requirements of consuming industries keep in step. Steel prices are kept down by surplus producing capacity of the steel industry, says Doctor Haney.—Page 160.

* * *

In resistance to wear, manganese steel outlasts plain carbon steel 10 to 1, abrasion test reveals. Chromium increases wearability of pearlitic steels very little, but nickel increases it to a marked extent.—Page 142.

* * *

High-test cast iron should be made in the electric furnace, not in the cupola. When produced in the cupola, a large quantity of steel must be added, and a powerful blast maintained. Even then it is difficult to obtain a uniform product.—Page 148.

* * *

Have the days of high dividends on industrial common stocks passed? Well-managed concerns are paying dividends about equal to returns on a good bond and are plowing the remainder of earnings back into the business, to insure a continuation of adequate earnings.—Page 143.

Iron and Steel Markets

July Gives Unusual Promise

Bookings Have Taken a Spurt, Though Still Mostly for Immediate Needs—Makers Look to Increasing Tonnage to Help Prices

STEEL business developing in the past week promises to make the month the best July in years. The expansion in an ordinarily dull month, coming after production in the preceding half year had made a record, is broadly surprising. As buyers today still are taking only what they expect to use, the high rate of output so far this year proves there has been continued high consumption, and that accumulations from first-half shipments are negligible.

Producers have reappraised the outlook and, counting on a better volume than seemed likely a few weeks ago, depend on increasing tonnage to help in price betterment.

Meanwhile a movement is gaining favor among the makers to demand completion of specifications on present quarter commitments prior to Sept. 15. Recent laxity in accepting releases against contracts has permitted consumers to get the benefit of a given price well into the succeeding quarter, and the 1.90c., Pittsburgh, quotation on bars and other heavy tonnage products, for example, has only lately applied and on scattered buying. The \$2 a ton advance over present asking prices announced last week for fourth quarter business is another signal of the efforts to lift prices. A like advance is now under consideration for cold finished steel bars.

Operations for the industry as a whole are close to 75 per cent, a few points under June, which in turn was less than 10 per cent under the average of the record output of the first six months of the year. At the moment shipments are equal to bookings and in some cases higher, and while there was considerably more third quarter contracting than in this season in 1927, the buying has been in the main for the lighter products, with a dearth of the kind of specifications that make for rolling economies.

Of the major consuming industries, building construction continues highly active, with many of the fabricating shops almost fully scheduled for the rest of the year. The railroads, still silent on cars and locomotives, have made fresh purchases of 65,000 tons of rails, including the Northern Pacific for 25,000 tons and the Great Northern for 8000 tons, in part in both cases for early delivery.

Opinions are mixed that the automobile builders can keep up the present output after Aug. 1, but for the present their taking of alloy steel bars and cold finished steel is heavy and stamping and forge shops are well filled with automobile work. The oil industry is responsible for the large additions to pipe mill order books, with a number of long pipe lines yet to be placed.

The agricultural implement makers report the best business in ten years.

Price irregularities are now confined almost solely to sheets. Black sheets appear to be settling down to a rather common 2.60c., Pittsburgh basis, although this quotation only recently appeared. Blue annealed sheets have sold for both 1.90c. and 2c. On galvanized sheets 3.40c., Valley, and 3.50c., Chicago, have been the exception, in some cases explained as a concession of \$2 a ton to jobbers.

The reduction made last week in wire products caused a spurt of buying in some centers, but that of \$2 in nails, which was a meeting of an existing basis, brought only a moderate response, except that car lot buyers in consuming industries are trying for the jobber price of \$2.55 a keg.

Fabricated steel bookings in June represented 81 per cent of capacity, compared with 83 per cent in May, but except for May and July, 1927, they were the largest in several years.

Current fabricated structural steel orders were more than 42,000 tons for the third successive week. Included were office buildings in New York and Baltimore, which took 13,000 and 7700 tons, respectively. New projects call for 36,700 tons, the highest amount in recent weeks. New York subway work accounts for 15,000 tons, while 4500 tons of plates may be required for water mains for Oakland, Cal., though cast iron pipe to the amount of 22,000 tons may be substituted.

Reductions a week ago of 50c. a ton in foundry pig iron at Chicago and in eastern Pennsylvania have not stimulated buying. Foundries are content to cover for early requirements, except the case of an expected purchase of 5000 tons for last half by a sanitary ware manufacturer for its Louisville, Ky., plant.

Scrap is weak in all markets. At Pittsburgh further reductions of 25c. and 50c. a ton on a number of grades, including heavy melting steel, bring prices close to pre-war levels.

Export purchases again make up the bulk of railroad equipment buying. Following 1100 freight cars recently placed by an Argentine railroad with American car builders, a Brazilian carrier last week bought in this country 1000 freight cars. And the Argentine road is preparing to inquire for some 60 locomotives. The only important domestic business placed was 250 gondola bodies for the Chicago, Rock Island & Pacific.

Exports from the United States of metal-working machinery were the greatest, in 1927, for seven years.

While THE IRON AGE pig iron composite price remains for a second week at its low of \$17.09 a ton, that for finished steel is now 2.319c. a lb., against 2.326c. last week.

Pittsburgh

Carnegie Steel Co., Followed by Independents, Announces 2c. for Fourth Quarter Plates, Shapes and Bars

PITTSBURGH, July 17.—Steel producers in this district are taking a stronger position with regard to prices, and the past week has seen a somewhat firmer tone in heavy rolled lines. The quotations of 1.90c., Pittsburgh, for the third quarter, and 2c. for the fourth quarter on bars, plates and shapes give evidence of the apparently growing confidence of makers in the price situation. Further support is indicated by a contemplated increase of \$2 a ton to 2.20c. on cold-finished steel bars for fourth quarter shipment. While the three heavy rolled lines still are obtainable for the third quarter at 1.85c., this figure is not so common. The quotation of 1.90c. appears to be an increasing factor in the market and a small amount of business has been taken at this level, though it has not reached a dominating position.

The quotation of 2c. on bars, shapes and plates for the fourth quarter, announced officially Monday by the Carnegie Steel Co. and made effective at once, has been adopted by independent producers and is considered to have given strength to the third quarter quotation of 1.90c. It is not expected that fourth quarter business will be taken this early on the new basis, which represents an increase of \$2 a ton over the third quarter quotation. The activity in the heavy rolled

products has undoubtedly given a better tone to the market. These lines, along with such products as tin plate sheets and pipe, played an important part in the unfilled tonnage showing of the United States Steel Corporation. The proposed plan to increase fourth quarter prices on cold-finished steel bars is a reflection of the fair activity in that market, together with the stronger position of the market for hot-rolled bars.

Tin plate and sheet business is good.

Sheet mill operations are at the rate of about 75 per cent, while tin mills are engaged at over 90 per cent of capacity. Pipe mills are operating up to 75 per cent or more and showed an increase during the past week of about five points. Large tonnages of oil line pipe recently placed have been an important influence in stimulating production.

Steel works operations also have shown a further increase and now are at the rate of approximately 75 per cent of capacity. From a tonnage viewpoint, the trade is well satisfied with conditions for this season of the year.

The market for pig iron is dull, except for somewhat increased activity in demand for Bessemer tonnages. The market for fuel is extremely dull, and there has been further softening in the market for old material.

The Jones & Laughlin Steel Corporation on Monday blew in an additional furnace and now has 10 of its 12 stacks making iron. The Adrian Iron Co., it is understood, will blow in a stack at Dubois, Pa., on foundry iron on Aug. 1.

So far the hot weather has affected production very little.

Pig Iron.—Moderately increased buying of Bessemer iron has taken place during the past week, but on the other grades inquiry continues extremely dull, and sales have been insufficient to test the strength of prices, so quotations are unchanged. The largest sale of Bessemer iron was 1000 tons, bought by a steel castings producer from a Valley maker at \$17, furnace. Another sale of 750 tons of Bessemer iron by a Valley producer also was made. Car lots of foundry have been sold at \$16.75, Valley furnace. Basic iron is quoted at \$16, Valley furnace, but the market for this grade is so dull that, in the absence of any sizable movement, it is considered nominal at this level. The Westinghouse Electric & Mfg. Co. has not closed on its requirements for its Trafford, Pa., plant. The Jones & Laughlin Steel Corporation on Monday blew in one of the idle furnaces of the Eliza group at the South Side works. This interest is now operating 10 of its 12 blast furnaces. It is reported that the Adrian Iron Co. will blow in a furnace on foundry iron at Dubois, Pa., on Aug. 1.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry	16.75
No. 3 foundry	16.25 to 16.50
Malleable	17.00
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—The market for semi-finished steel is only fair, with little third quarter contracting. Prospects for better commitments are in sight, however, particularly because of heavy rolling in such lines as sheets, and somewhat more activity in the market for bars, affecting demand for sheet bars and billets. While some makers continue to quote standard billets and sheet bars at \$33, the prevailing level is \$32, Pittsburgh, at which the market is firm. This is indicated by the fact that mills are no longer equalizing freight. Owing partially to the recent heavy orders for oil line pipe, the market for skelp is firmer at 1.85c., Pittsburgh or Youngstown. Demand for slabs is quiet, and the

market is quoted at \$32, Pittsburgh or Youngstown. Wire rods continue to be quoted at \$42, Pittsburgh, for third quarter shipment. No price has been named for this product for fourth quarter. Fourth quarter billets are quoted at \$33.

Bars, Plates and Shapes.—Third quarter business for bars, plates and shapes still is being taken by some mills at 1.85c., Pittsburgh, and the market is firm at this level. Some prominent makers, however, are quoting 1.90c. for third quarter business, and they are reported to have taken some tonnage at this figure. In all three lines improvement in demand has developed during the past week, with the market manifesting a rising tendency. That producers feel more confident of their position in quoting 1.90c. for third quarter delivery is indicated by the quotation of 2c. they have announced for fourth quarter shipment. The Carnegie Steel Co. yesterday officially announced the price of 2c. on fourth quarter business, effective at once, and independent producers have also adopted this figure, which is an increase of \$2 a ton over the quotation of 1.90c. on third quarter business. The small amount of railroad car buying is an unfavorable influence in the market, but taken as a whole activity is good and above the average for this season of the year. Inquiries coming to structural fabricators are numerous, but for the most part are for small lots.

Rails and Track Supplies.—No improvement has developed within the past week in the market for standard or small spikes, for which demand is rather dull. No standard rail requirements have come out during the past week, and it probably will be 30 to 60 days before such tonnages in volume come into the market. The Norfolk & Western Railroad has not closed on its inquiry for 37,000 tons for July-January shipment. A slight improvement exists in the market for light rails, which are quoted at \$36, Pittsburgh.

Wire Products.—All makers of wire and wire products are quoting on the basis of the card announced last week by the American Steel & Wire Co., listing prices for third quar-

ter shipment. Wire nails and cement coated nails are quoted at \$2.55 per 100-lb., keg, Pittsburgh or Cleveland, with fair specifications for the former, while demand for cement coated nails is quiet. Demand for plain bright, hard fence wire is somewhat better, though not markedly so. Operations of wire mills remain unchanged at approximately 55 per cent of capacity.

Tubular Goods.—Following recent large orders, aggregating perhaps 200,000 tons, active demand for oil line pipe has shown a recession. Some fair-sized inquiries are expected to come into the market soon, however. The large tonnages placed have stimulated production, and operations now are estimated at about 75 per cent or more of capacity. Demand for standard pipe continues good, a fair portion of it coming from the construction industry. The increased price of crude oil has given a better tone to the market, but overproduction still is a serious problem in the oil industry. The Okmulgee Oil & Gas Association, Okmulgee, Okla., has addressed a letter to the Secretary of the Interior at Washington, asking for his opinion as to the possible attitude of the public toward placing a duty on imports of crude oil. This, together with other activities of the oil industry, is interpreted to mean that a section of it, at least, will urge at the next session of Congress an impost on imports of crude oil. Such an effort has been made for the past decade but without success, and it is believed that domestic producers owning fields in Central America and other foreign countries will continue to combat the effort. It is argued that if imports were appreciably reduced, the domestic industry would be considerably stimulated and heavy orders would be placed for pipe.

Sheets.—Specifications for sheets last week were large. The hot weather affected output somewhat and production was on a basis of about 75 per cent of capacity. A large number of specifications call for rush shipments. Increased tonnages are being placed for car material, mostly for repair work. These requirements are largely for galvanized

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

sheets for roofing and for refrigerating cars, and also blue annealed sheets for freight cars generally. Demand, however, comes from numerous sources. More activity has been shown by jobbers, although they are not contracting freely. Prices are firm, with blue annealed quoted at 2c., galvanized at 3.50c., and black at 2.65c., Pittsburgh.

Ferroalloys.—Inquiry for ferromanganese is light. Many consumers are covered for the last half. The market is unchanged at \$105, Atlantic seaboard, for both domestic and foreign material. Consumers of 50 per cent ferrosilicon are supplied for the last half, and the market for this product is dull. Specifications for speigeleisen are small. Quotations range from \$31 to \$32, furnace.

Tin Plate.—While hot weather during the past week slowed down production of tin mills in this district, the loss in output was comparatively small. Mills are receiving heavy specifications, but despite large commitments some producers are a little ahead on obligations and have even been able to fill some requirements which call for August delivery. The American Sheet & Tin Plate Co. operated 96 per cent of its tin mills last week, and probably will maintain that rate during the current week. Some independents also are producing at or near that rate.

Cold-Finished Steel.—Demand for cold-finished steel bars is regular and fair, and production is at the rate of 65 to 70 per cent. Automobile makers continue a prominent factor in the market, the tone of which is stronger at 2.10c. per lb., Pittsburgh. It has been given stimulus partially by the stronger position of merchant steel bars. Some makers of cold-finished bars are contemplating an increase of \$2 a ton for fourth quarter delivery, which would be in line with the policy adopted regarding soft steel bars.

Hot-Rolled Flats.—Recent slacken-

ing in demand for hot-rolled strips was followed during the past week by heavy requirements, and the tone of the market generally has improved. While there has been a slight let-up in demand from the automotive industry, it continues fair. Whatever falling off there has been in that quarter has been offset by placements by other industries. The price situation is steadier, although some buyers still show resistance to current quotations.

Cold-Rolled Strips.—Demand for this line has improved and it is somewhat more active than that for hot-rolled flats. Operations generally are rated at about 70 per cent of capacity, which is heavier than they were in the corresponding period a year ago. The leading source of specifications is the automotive industry, but they also come from miscellaneous lines.

Bolts, Nuts and Rivets.—The market for bolts, nuts and rivets is fair. The automotive industry is buying in moderate volume, although demand from this source has tapered off somewhat. Prices are unchanged, and operations are at the rate of about 60 per cent of capacity.

Coal and Coke.—Extreme dullness prevails in the market for fuel. Small lots of Lake cargo coal are moving, but the market shows no improvement. Consumers in this district appear to have ample stocks on hand and are showing practically no interest in the market. Prices are unchanged. Only light tonnages of bee-hive coke are being bought, and inquiry for both the furnace and foundry grades is unusually limited. There is slightly more activity in the latter than in the former. Virtually no contracting has developed as yet. Prices vary, depending on the quality, but on spot shipments the levels of \$2.60 on furnace coke, and \$3.75 on foundry fuel at Connellsville ovens continue to be representative of the market.

Old Material.—Further softening has developed in the market for scrap. Heavy melting steel is down 25c. a ton; heavy breakable cast for the basic open-hearth furnace and low phosphorus punchings for the electric furnace have declined 50c. a ton, while a drop of 25c. has taken place on railroad knuckles and couplers, railroad coil and leaf springs, and rolled steel wheels for the acid open-hearth furnace. Recent sales have established \$14 as the maximum price on heavy melting steel. The Pennsylvania Railroad list, which closed last week, brought out prices as high as \$14.75, Steubenville, Ohio, and 10c. or 15c. less at Midland, Pa., on this grade, but, as is often the case, such tonnages commanded premium prices. Some of the material was taken by dealers to cover on contracts. Consumers generally are well supplied with scrap and are reported still to have sufficient stocks on hand to keep them out of the market for 30 days or more. Supplies in the hands of dealers, for the most part, appear to

be small, and caution is being shown by them in taking additional tonnages except as immediate requirements demand.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$13.75 to \$14.00
Scrap rails	13.25 to 13.50
Compressed sheet steel....	13.50 to 14.00
Bundled sheets, sides and ends	12.50 to 13.00
Cast iron carwheels.....	14.00 to 14.50
Sheet bar crops, ordinary....	14.00 to 14.50
Heavy breakable cast.....	11.00 to 11.50
No. 2 railroad wrought....	13.75 to 14.00
Heavy steel axle turnings....	12.00 to 12.50
Machine shop turnings....	9.00

Acid Open-Hearth Grades:	
Railr. knuckles and couplers	14.75 to 15.25
Railr. coil and leaf springs	14.75 to 15.25
Rolled steel wheels.....	14.75 to 15.25
Low phos. billet and bloom ends	19.00 to 19.50
Low phos. mill plate....	17.50 to 18.00
Low phos., light grade....	16.50 to 17.00
Low phos. sheet bar crops....	17.50 to 18.00
Hvy. steel axle turnings....	12.50 to 13.00

Electric Furnace Grades:	
Low phos. punchings.....	16.00 to 16.50
Hvy. steel axle turnings....	12.50 to 13.00

Blast Furnace Grades:	
Short shov'l'g steel turnings	9.50
Short mixed borings and turnings	9.50
Cast iron borings.....	10.00
No. 2 busheling.....	8.50 to 9.00

Rolling Mill Grades:	
Steel car axles.....	18.00 to 18.50
No. 1 railroad wrought....	10.50 to 11.00
Sheet bar crops.....	16.00 to 16.50

Cupola Grades:	
No. 1 cast.....	14.25 to 14.50
Rails 3 ft. and under....	15.00 to 15.50

Malleable Grades:	
Railroad	13.75 to 14.00
Industrial	13.25 to 13.50
Agricultural	12.75 to 13.00

Carnegie to Build New Pittsburgh Warehouse

The Carnegie Steel Co. has filed plans for a new warehouse on Light-hill Street, Pittsburgh, to cost \$296,000, with equipment. The new warehouse is to replace the old one on Eleventh Street, which was taken over by the Pennsylvania Railroad in connection with its plans for a new freight yard in that section.

Mexico, said to be second to China as a producer of antimony, mined much less of that mineral last year, according to reports from American consuls at Mexico City, San Luis Potosi and Nogales, made public by the Department of Commerce. Official figures placed Mexico's antimony output in 1927 at 1894 tons, compared with 2573 tons the preceding year, which was a record year.

The blast furnace of the Temple Iron Co. at Reading Pa., has been sold at a public sale by Paul Brooks, receiver, for \$52,266 to Abraham Sofransky, Allentown, Pa., and Israel Liever, Reading, Pa., dealers in scrap iron and metal. The unit will be dismantled at once.

The Eastern Scrap Iron Association has appointed Benjamin Schwartz, a lawyer of Baltimore and Philadelphia, as director-general of its activities.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes....	2.90c.

Milled studs.....	70 and 5

Chicago

Steel Backlogs Diminishing Though Current Bookings Are Large—Ingot Output Expected to Decline

CHICAGO, July 17.—Bookings in finished steel are larger than at this season a year ago, but backlogs are diminishing, especially in the heavier rolled products. While steel ingot output is unchanged at 75 to 80 per cent of capacity, present indications point to a decline of 10 points or more before the middle of next month. Specifications from the farm equipment and automotive industries, as well as from miscellaneous manufacturing lines, are well maintained, but heavy-tonnage orders for oil storage tanks and railroad cars are lacking. Fabricating awards are also light, although a large amount of structural work is still pending. Some of the larger building projects, however, are slow in maturing, being held back by delays in financing.

Business now being booked is mainly in lighter products, which, although they keep the mills busy, take proportionately smaller quantities of raw steel. There is a dearth of the kind of specifications that make for economical operations.

Rail orders placed by the Northern Pacific and the Great Northern added a total of 21,000 tons to the bookings of local mills. This is not sufficient, however, to have much effect on rail production in this district. One rail mill has virtually completed deliveries against its contracts, the other may be able to continue through this month at a 60 per cent rate.

In comparison with bookings in the first week of the month, which was characterized by the dullness that usually follows the completion of a quarter, business in the past week was good. Total sales were 50 per cent greater and specifications 100 per cent greater than in the previous week. There has been a fair volume of third quarter contracting, considerably more than at this season in 1927, but buyers are not obligating themselves for more steel than they expect to use.

Business in bars is much more active than in structural shapes or plates. Demand for sheets in this district continues to drag. In the absence of severe tests, mill prices appear to be holding. As low as 1.95c., Chicago, has been done on attractive tonnages of sheared plates, and 3.50c., Chicago mill, has been named on galvanized sheets, but such concessions are exceptional. In fact, local mills are apparently more determined than ever to hold prices at a stable level.

As announced in THE IRON AGE market summary a week ago, the Chicago subsidiary of the Steel Corporation is quoting 2.10c., Chicago, on bars, plates and shapes for fourth quarter shipment, or an advance of \$2 a ton over the current market. Thus far, however, little interest in fourth quarter requirements has been shown.

Another evidence of efforts by mills to stiffen the market is an announcement that no specifications against third quarter contracts will be accepted after Sept. 15. Of late, laxity in accepting specifications has permitted consumers to get the benefit of a given price well into the succeeding quarter.

Pig Iron.—The reduction last week of 50c. a ton on foundry and malleable grades to \$17.50, base, local furnace—the lowest price since November, 1915—has brought no unusual amount of buying. Many melters are covered through this quarter and others are in no hurry to buy. The attitude of buyers is no doubt explained by seasonal dullness, which is beginning to make itself felt in some directions. On the other hand, automobile companies that have brought out new models are placing larger orders for castings. Large inquiries for pig iron are lacking and there have been only a few sizable sales. Several lots of 500 to 1000 tons of foundry iron have been placed in Chicago, and a northern Illinois melter closed for 1000 tons of foundry for the remainder of the year. Opinion is divided on whether the recent reduction in Chicago pig iron will keep out shipments of iron by boat. It is agreed that little foundry iron in the base grade can be shipped in by water at the present market, but it is said that iron in higher silicon analysis may still succeed in penetrating this district. It is a matter of comment that local prices are now lower than delivered prices in Cleveland and are on a parity with the ruling furnace price at Detroit.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	\$17.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75	18.00
Malleable, not over 2.25 sil.	17.50
High phosphorus	17.50
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	21.51
So'th'n No. 2 (barge and rail)	21.01
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15%	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—The market is inactive. Spiegeleisen remains at \$32, furnace, on contracts and at \$33, furnace, on spot business. Some interest is manifested in the possibility of shipping ferromanganese by ocean vessel from England to Chicago at a rate of \$5.60 per ton. If sellers should insist on a price of \$105, seaboard, there would be no advantage in shipping the material by this route.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Plates.—Both sales and specifications showed a recovery following a

lull in bookings during the first week of the current quarter. Sales for the week were nearly twice as large as in the previous seven-day period. Mills are still able to operate at 80 per cent of capacity, but backlogs are diminishing and there is little heavy-tonnage business pending. No new oil storage tank work has appeared and little railroad car business is developing. Meanwhile railroad car builders are fast completing contracts in hand. A report that the Pennsylvania Railroad will enter the market for several thousand freight cars lacks verification. Current orders are mainly from miscellaneous manufacturers and structural fabricators. Prices are unchanged in the absence of a real test.

Mill prices on plates, per lb.: 2c., base Chicago.

Structural Material.—Fabricating awards are light and competition for pending business is keen. While there are several very large local projects in prospect, notably the Apparel Mart, 60,000 tons, and the Agricultural Mart, 80,000 tons, they are slow in maturing. Early action is expected on 2500 tons for a pipe shop to be built for the A. O. Smith Corporation, Milwaukee. The ruling price on plain material remains at 2c., Chicago.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Sheets.—Demand is light except from the automotive industry, which gets relatively little sheet tonnage from Chicago district mills. Sheet producers in this area are finding it difficult to maintain a 60 per cent rate of operations. Prices are holding as a rule, although in the Northwest as low as 3.50c., mill, a concession of \$2 a ton, has been done on galvanized in a few instances.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c.; No. 24 galv., 3.65c.; No. 10 blue ann'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Bars.—Demand for bars is considerably heavier than a year ago. Shipments of mild steel bars to the automotive industry are in undiminished volume. The Nash Motors Co. has 30,000 cars on order and is trying to reach a maximum production rate, with a scheduled monthly output of 20,000 cars for July, August and September. The plants of the Studebaker Corporation, the Chrysler Corporation and the Willys-Overland Co. are reported to be operating at capacity. The Willys-Overland Co. is said to have sold more cars in the first six months of 1928 than in all of last year. Farm equipment manufacturers, optimistic on account of favorable crop prospects, are through with inventory-taking and are getting production up to capacity as rapidly as possible. They are reported to be enjoying the best business in ten years. Third-quarter contracting is in larger volume than a year ago, although buyers are obligating themselves only for known requirements. The leading interest has announced that it will accept no third-quarter specifications after Sept. 15. Demand

for alloy steel bars continues at a high rate, reflecting the activity of automobile plants that buy from Chicago mills. Seasonal dullness prevails in rail steel bars, although mill backlogs are large enough to insure double turn operations through July and well into August. Bed makers are expected to buy more actively with the conclusion of the furniture show. Specifications fall slightly short of shipments, but a reduction in output is being avoided by accumulating stocks of reinforcing bars and fence post steel. Rail steel bar prices are steady at 1.85c., Chicago Heights.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Wire Products.—The recent general reduction in mill quotations failed to stimulate buying to any great extent. There has been some third-quarter contracting, but an increasing number of jobbers and consumers are showing a preference for open market buying. Manufacturers' wire is more active than common products. The sustained activity of the automotive industry has been reflected in a large consumption of wire. The market in common products is expected to remain quiet until mid-August, and the sales force of a leading wire products manufacturer is now on vacation. Shipping orders are sufficient to support mill operations at 65 per cent of capacity. For mill prices see page 175.

Cold-Rolled Strip.—Mill prices have now settled to a single price of 3c. per lb., Cleveland, for lots of 1 ton up to 3 tons, or 3.30c., Chicago. Specifications are still in good volume from the automotive trade. An estimate that the State of Michigan alone uses 250,000 tons of cold-rolled strip a year, or nearly 42 per cent of the entire country's consumption of 600,000 tons, indicates the importance of the automobile industry as a strip mill customer.

Warehouse Business.—Local warehouse prices are unchanged. Jobbers find the volume of trade about on a par with that of July, 1927.

Rails and Track Supplies.—The Northern Pacific has placed 15,000

tons of rails with the Illinois Steel Co. and 10,000 tons with the Bethlehem Steel Co. The Great Northern has bought 8000 tons, of which 4000 tons was placed with the Illinois Steel Co. and 2000 tons each went to the Inland and Bethlehem companies. The Great Northern wants early delivery on this tonnage and is expected to come in the market for additional requirements totaling close to 20,000 tons. Early shipment is also wanted on part of the Northern Pacific tonnage. This business, together with good-sized releases of contract tonnage, will keep one of the local rail mills going for the rest of the month at a 60 per cent rate. The other rail mill, however, has virtually reached the end of its backlog. Orders for tie plates, angle bars, spikes and bolts distributed by the Great Northern with the rail purchases total 2000 tons. The Northern Pacific, however, bought only 500 tons of track supplies, representing requirements for 2000 tons of rails on which prompt shipment was asked. In addition to these orders, about 2500 tons of track fastenings on contract was released for rolling. Production of tie plates is at 100 per cent of capacity at a leading plant, while the operating rate averages 40 per cent for bolts and ranges from 60 and 70 per cent for spikes and angle bars.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Outside of a fair run of small orders from contractors, new business is light. Prices, however, are stronger, ranging from \$32 to \$35, Birmingham, for 6-in. and larger diameters. In fact, several companies are quoting a minimum of \$35 on all business, while others are asking that price on lots of less than 200 tons. Milwaukee will close July 18 on 750 tons of 6-in., 950 tons of 8-in., 75 tons of 12-in. and 225 tons of 16-in. Class C. St. Clair Shores, Mich., will take bids July 24 on 45,000 ft. of 6-in. and 60,000 ft. of 8-in.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in., and over, \$40.20 to \$43.20; 4-in., \$44.20 to \$47.20; Class A and gas pipe, \$4 extra.

Reinforcing Bars.—This market shows greater activity in awards, though individual lettings usually run less than 300 tons each. The pending list is still of such size that it holds out fair promise to dealers. Fresh projects are scarce but estimators are busy and it is not unlikely that the next three or four weeks will find prices being asked on a number of new tonnages. The Chicago Rapid Transit Co. is elevating its track in North Evanston, Ill., and will require reinforcing bars for retaining walls. Opinions as to trends in prices are varied and it may be said that the market lacks the strength displayed two weeks ago. New contracts and fresh inquiries are given on page 190.

Cold-Finished Bars.—Current business is about on a par with that of a year ago. Some seasonal recession in specifications from the automobile in-

dustry, as well as from other lines, has developed.

Bolts, Nuts and Rivets.—Specifications are again coming in large volume from the farm equipment industry, although in previous years production of implements and tractors was rarely resumed on a broad scale before the middle of August. Business from the automotive industry also remains good. Bolt and nut plants are operating at a 65 per cent rate.

Old Material.—The market has a weak tone, but trade is so inactive that prices have undergone little change. The supply of scrap is large, and consumption is declining. Buyers are looking for still lower prices and expect to get them. The melt of steel foundries is lower, and there has been a marked decrease in activity among malleable plants. Meanwhile mill output is rather well maintained, although a more pronounced seasonal decline is expected to develop in August. Railroad lists include: Chicago & Alton, 1500 tons; Chicago, Milwaukee, St. Paul & Pacific, 200 tons; Chesapeake & Ohio, 17,500 tons.

Prices deliv'd consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.25 to \$12.75
Shoveling steel	12.25 to 12.75
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraulic compressed sheets	11.00 to 11.50
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'd steel carwheels	15.25 to 15.75
Railr'd tires, charg. box size	15.50 to 16.00
Railr'd leaf springs, cut apart	15.50 to 16.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	13.75 to 14.25
Coil springs	15.75 to 16.25
Electric Furnace Grades:	
Axle turnings	12.50 to 13.00
Low phos. punchings.....	14.00 to 14.50
Low phos. plate, 12 in. and under	14.00 to 14.50
Blast Furnace Grades:	
Axle turnings	9.50 to 10.00
Cast iron borings.....	9.00 to 9.50
Short shoveling turnings..	9.00 to 9.50
Machine shop turnings....	6.00 to 6.50
Rolling Mill Grades:	
Iron rails	13.50 to 14.00
Rerolling rails	14.75 to 15.25
Cupola Grades:	
Steel rails less than 3 ft..	15.25 to 15.75
Angle bars, steel.....	14.25 to 14.75
Cast iron carwheels.....	12.75 to 13.00
Malleable Grades:	
Railroad	12.50 to 13.00
Agricultural	11.50 to 12.00
Miscellaneous:	
*Relay'g rails, 56 to 60 lb.	23.00 to 25.00
*Relay'g rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	13.50 to 14.00
Iron arch bars and transoms	19.50 to 20.00
Iron ear axles	23.50 to 24.00
Steel car axles.....	15.50 to 16.00
No. 1 railroad wrought..	10.75 to 11.25
No. 2 railroad wrought..	11.00 to 11.50
No. 1 busheling.....	9.50 to 10.00
No. 2 busheling.....	5.75 to 6.25
Locomotive tires, smooth..	12.00 to 12.50
Pipes and flues.....	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast....	13.50 to 14.00
No. 1 railroad cast.....	12.75 to 13.25
No. 1 agricultural cast....	12.50 to 13.00
Stove plate	10.75 to 11.25
Grate bars	11.25 to 11.75
Brake shoes	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Philadelphia

Steel Buying Shows Further Gains in July's Second Week —Scrap Market Weaker

PHILADELPHIA, July 17.—Steel business, having shown unusual summer vitality in the first week or ten days of July, has made further gains in the last week. If the orders of the latter half of the month equal those of the first half, the month may be the best July in several years. Everything ordered is wanted in a hurry; mills which are unable to ship within a week are frequently unable to secure the order. A more liberal volume of orders from the Pennsylvania Railroad has helped the situation materially. Structural steel is one of the most active lines. New projects are not numerous, but fabricating shops have nearly full schedules and are drawing on the mills for a fairly large tonnage. The average operation of all Eastern mills is probably not less than 75 per cent. The Bethlehem Steel Co. averages 80 per cent in all departments. Other mills rolling shapes are running from 70 to 80 per cent, while plate mill operations range from 50 to 65 per cent. Steel prices are holding fairly steady. Foundry pig iron remains at the \$19.50 base, to which it declined a week or so ago. Scrap shows further weakness.

Pig Iron.—Foundry pig iron, which declined a week or so ago to \$19.50, base, at eastern Pennsylvania furnaces, is holding at that level, with some single carload sales at \$20. Business has been unimportant as to volume. A 400-ton inquiry for foundry iron brought sharp competition between eastern Pennsylvania and New York State furnaces, and the business is reported to have been placed with a New York maker at slightly under the quotations of furnaces in this district. Copper free low phosphorus iron is quoted by a nearby furnace at \$24, furnace, and copper bearing iron is available at \$23, furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.	21.26
Basic (del'd east. Pa.)	\$19.00 to 19.50
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Most of the larger users of ferromanganese are still getting shipments against \$100 first half contracts, or have sufficient stock piles to cover nearby requirements. Some of the smaller users have made second half contracts at \$105, seaboard, but the bulk of the second half contracting probably will not be done before August.

Billets.—Quotations on rerolling billets range from \$32 to \$33, Pittsburgh, with the higher figure generally used on high carbon grades. Forging billets remain at \$38, Pittsburgh.

Plates.—A steady flow of small, hurry-up orders for plates is keeping operations at Eastern mills on an even keel. One mill is operating at about 65 per cent, while others are at 50 to 60 per cent. On nearly all sales 2c., Coatesville, applies.

Structural Shapes.—Not many new structural steel projects have come out

for bids in the last week, but fabricators are extremely busy with work on their books and some are bidding only on those jobs which will fit in with their delivery promises. A number of shops can take small jobs to fill in, but cannot accommodate large jobs to their shop schedules if early deliveries are required. Prices of plain material have weakened again, sales having been made to some of the larger fabricators at 2.01c., Philadelphia, though most of the transactions are at 2.06c., Philadelphia. This is peculiarly a local condition, but even at some points where Pittsburgh freight rates are the governing factor Eastern mills are unable to obtain more than 1.75c., Pittsburgh, on competitive business.

Bars.—Some mills have extended second quarter contracts at 1.85c., Pittsburgh, so that consumers' requirements for all of third quarter will be provided for at this price; other mills, however, are insisting that all 1.85c. tonnage shall be specified by Sept. 10. The groundwork is being prepared for an advance to be effective on all fourth quarter business.

Sheets.—Makers of sheets are standing somewhat more firmly for

present prices, with the result that quotations are more nearly uniform than in some time. On galvanized sheets, 3.50c., Pittsburgh, to consumers and 3.40c. to jobbers are the usual quotations. Black sheets are at 2.65c., with occasional transactions at 2.60c., while blue annealed sheets remain at 2c., with some mills getting \$1 or \$2 a ton higher for small lots in widths greater than 40 in.

Imports.—Last week's receipts from abroad included 9710 tons of Algerian iron ore, 996 tons of pig iron from India, 100 tons of steel scrap from Germany, 50 tons of ferromanganese from England, 30 tons of steel bands from England, 69 tons of steel bars and 201 tons of structural shapes from Belgium.

Old Material.—Prices for various grades of scrap have gone so low that scrap dealers and brokers are expecting a rebound, but the demand from consumers which would make such a recovery possible fails to develop. Meanwhile, the amount of scrap that must be shipped seems sufficient to take care of all demands, and buyers have pushed prices still further downward in the past week, although the changes are slight. A nearby steel mill has been sounding out the market for heavy melting steel, and it is reported, is willing to pay \$12.50, delivered at its plant, but dealers and brokers are holding for \$13.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails.	12.50
No. 2 heavy melting steel.	10.50 to 11.00
No. 1 railroad wrought.	13.50 to 14.50
Bundled sheets (for steel works)	9.50 to 10.00
Machine shop turnings (for steel works)	10.00 to 10.25
Heavy axle turnings (or equiv.)	12.00 to 13.00

Navy Wants 1950 Tons of Plates and Bars

WASHINGTON, July 17.—The Bureau of Supplies and Accounts, Navy Department, will open bids on July 24 for approximately 1300 tons of plates and 650 tons of steel bars for delivery at various navy yards.

The Colonial Steel Co., Pittsburgh, has opened its new St. Louis warehouse at 712-14 Cass Avenue. High-speed, carbon tool and hollow and solid drill steels are carried in stock, and Charles V. Franklyn is district manager.

New York.

Pig Iron Sales Total About 12,000 Tons—15,000 Tons of Steel Needed for Additional Subway Work

NEW YORK, July 17.—With sales of about 12,000 tons during the past week, the pig iron market has shown more activity than has been in evidence for more than a month. This is due partly to increased foundry operations in western Connecticut and New Jersey and may also be attributed partly to the fact that consumers have been hesitant in making third quarter commitments. Recent buying however, has been largely for spot shipment to cover melters' immediate operating needs and does not indicate any desire on the part of consumers to take advantage of the present low price levels to anticipate future requirements. New inquiry is not in large volume and includes 1000 tons for the Pennsylvania Railroad and several lots of 100 to 300 tons. An inquiry for 2000 tons of ballast iron for delivery on the Pacific Coast has not been acted upon, and a New York district melter is still in the market for 1000 tons. The Crane Co., Bridgeport, Conn., has closed on its recent inquiry for 1200 tons of foundry iron, the order having been divided between a Buffalo furnace and the Massachusetts maker. The Worthington Pump & Machinery Corporation has also bought an additional 550 tons for Harrison, N. J., the order having been divided between a Buffalo furnace and an eastern Pennsylvania interest. Two merchant stacks in the Buffalo district have been blown out during the last three weeks and another is expected to follow the last of the month. However, following a reduction in freight rates effective Aug. 4, the Perry furnace at Erie, Pa., will be able to compete in the New York district on an equal basis with the Buffalo producers. Apparently in an effort to compete with the barge and rail rate from Buffalo to eastern Pennsylvania cities, the Delaware, Lackawanna & Western Railroad has reduced the freight rate between Buffalo district points and Philadelphia from \$4.91 a ton to \$4.66. The reduction applies only until Sept. 1. Prices have not changed materially in the last week, with Buffalo foundry iron ranging from \$16 to \$17, base furnace. In New England an instance of the waiving of the silicon differential is reported. Eastern Pennsylvania producers are quoting \$19.50, furnace, and one large interest is quoting \$19.51 to \$20.01, eastern New Jersey tidewater, to meet prices of Buffalo and New York State furnaces.

Prices per gross ton, deliv'd New York district:
 Buffalo No. 2 fdy., sil. 1.75 to 2.25 \$20.91 to \$21.91
 East. Pa. No. 2 fdy., sil. 1.75 to 2.25 20.89 to 22.02
 East. Pa. No. 2X fdy., sil. 2.25 to 2.75 21.39 to 22.52
 East. Pa. No. 1X fdy., sil. 2.75 to 3.25 21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

Bars, Shapes and Plates.—Interest in the heavier products continues to center upon the efforts of mills to establish third quarter prices at 1.90c., Pittsburgh, for bars, 2.05c., Coatesville, Pa., for plates, and 2.05c., Bethlehem, Pa., for shapes. It now seems apparent, however, that too many

contracts have already been made, allowing customers the advantage of prices current during the quarter just passed, to enable mills to get the \$1 a ton advance to any extent during July, August and September. On spot business the new prices seem to be regularly adhered to, but contracts at the higher levels, particularly on plates and shapes, are the exception rather than the rule. But mills find encouragement in the statement of the Steel Corporation that fourth quarter prices will be on a basis of 2c., Pittsburgh, and also in the action of a number of producers in naming Sept. 10 as the last day on which specifications on present contracts will be accepted. This practice coincides with the policy already followed by some makers in which contract periods are based upon shipments rather than specifications. This plan would prevent consumers from obtaining materials on old contracts for a month or more after the beginning of a new quarter and enable mills to begin a three-month period without a large tonnage of old orders at conflicting prices on their books. Encouragement is also found in the well sustained tonnage which has been specified during the last two weeks, and the month's aggregate promises to be very satisfactory. An office building let during the week in New York will take 13,000 tons of shapes, and 15,000 tons will be required for two sections of the subways, on which bids will close July 27. Eastern car builders have taken orders for more than 2000 freight cars for two South American roads, but the only outstanding domestic inquiry, that of the Seaboard Air Line for 1000 box cars, has not yet been acted upon.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets and Strips.—Business continues in fair volume and the firmer tendency in prices, which has been manifested during the last two weeks, has given the market a more optimistic outlook. On galvanized sheets, only the large jobbers are being given the benefit of the 3.40c. Pittsburgh price, with the general run of business being taken at 3.50c. Black sheets range from 2.60c. to 2.70c., with 2.65c. the ruling price. A 2c. minimum is being maintained on the blue annealed product. There is not enough demand for strip steel to bring out price irregularity and what business there is to be placed is taken without difficulty at the established levels.

Cast Iron Pipe.—In spite of recent price advances by Southern makers, bids submitted last week on a large tonnage at Washington indicate a somewhat weaker tone in the Eastern market. On 3000 tons of 8, 12 and 16-in. class B pipe and some fittings, R. D. Wood & Co. were low with a bid of \$34.67 for pipe and \$72.24 for fittings. Other bids ranged from \$37 for pipe and \$93.50 for fittings to \$41 and \$110 respectively. The Warren Foundry & Pipe Co., with a bid of

\$38.40, was low on 300 tons of 3 to 12-in. class B pipe for Newark, N. J. Taking into consideration the considerable tonnage of small-dimension pipe included in the job, this bid is well within the range of \$37.60 to \$38.60, delivered New York, which is being generally quoted by Northern foundries. Southern makers continue to quote \$34 to \$35, base Birmingham, on the general run of business, equivalent to \$43.25 to \$44.25, delivered New York.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Old Material.—The scrap market is weak and inactive, with buyers' prices of heavy melting yard steel and stove plate off 25c. per ton. Other grades are unchanged but lack strength. Dealers in this district are showing considerable interest in the appointment of a director general for the East Scrap Iron Association, which was accomplished at a recent meeting in New York, with a view toward improving conditions in the industry.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.50 to	\$9.85
Heavy melting steel (yard)	6.00 to	6.25
No. 1 hvy. breakable cast.	10.50 to	11.00
Stove plate (steel works)...	6.75 to	7.25
Locomotive grate bars....	7.00 to	7.50
Machine shop turnings....	6.00 to	6.50
Short shoveling turnings..	6.00 to	6.50
Cast borings (blast furn. or steel works).....	6.00 to	6.50
Mixed borings and turnings	6.00 to	6.50
Steel car axles.....	13.50 to	14.00
Iron car axles.....	23.50 to	24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25 to	8.75
Forge fire	6.50 to	6.75
No. 1 railroad wrought....	9.50 to	10.00
No. 1 yard wrot., long....	8.00 to	8.50
Rails for rolling.....	10.00 to	10.50
Cast iron carwheels.....	11.00 to	11.50
Stove plate (foundry)....	8.50 to	9.00
Malleable cast (railroad)...		10.00
Cast borings (chemical)...	10.75 to	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.00 to	\$15.00
No. 1 hvy. cast (columns bldg. materials, etc.), cupola size	12.00 to	13.00
No. 2 cast (radiators, cast boilers, etc.)	11.50 to	12.50

Reinforcing Bars.—More than 1700 tons of bars will be required for a railroad bridge at Providence, R. I., on which the Merritt-Chapman & Scott Corporation, New York, is general contractor. Lettings during the last few days have included scarcely any large tonnages and the volume of small orders has been low. Distributors generally are quoting 1.90c., Pittsburgh mill, but on large jobs, on which lump sum bids are submitted, concessions usually appear. The Youngstown warehouse price is unchanged at 2.20c. per lb., or 2.57½c. on cars at New York, and out of New York warehouse the common quotations are 2.80c. for lots of 5 tons or more, 2.95c., for lots of 2 to 5 tons and 3.24c. for less than 2 tons, all delivered at job.

Warehouse Business.—Thus far in the month, business has generally been equal to, and in some cases has exceeded, that placed during the corresponding June period. Prices are unchanged in all lines, and sheets,

which have been the weakest item for some time, seem to be reflecting the somewhat firmer tone in mill prices.

Coke.—Most consumers who buy foundry coke over six-month or yearly periods have closed their contracts and spot buying is negligible. The price of foundry coke is unchanged at \$3.50, Connellsville, with the furnace grade quoted at \$2.50 to \$2.75.

Cleveland

July Steel Demand Holding Up Well—Some Automobile Plants Slowing Down Production

CLEVELAND, July 17.—The volume of business in finished steel is holding up well for July and the demand for some lines is better than for the same month last year. Specifications with some producers during the first half of July showed a slight gain over those of June. Orders from the automotive industry are holding up well on some products; for alloy steel particularly they show quite an increase over last month.

Some of the automobile manufacturers are slowing down production this month and by Aug. 1 they will be operating at considerably reduced schedules, compared with the peak of the spring season. Others that have brought out new models are still keeping up good production, but whether this will be maintained long depends on the extent to which the new models stimulate sales. Reports indicate a falling off in retail sales of cars, and there is some expectation that with the surprisingly large volume of business in the first half of the year there will be quite a curtailment in the demand for automobiles in the latter part of the year. Stamping plants and forge shops in this territory are still well filled with automobile work.

Sales during the week helped to clarify the price situation on steel bars, plates and structural material. While 1.90c., Pittsburgh, is still the asking price of several mills, most of the larger consumers are able to place orders at 1.85c., and the higher price is generally limited to small-lot buyers. Cleveland mills quote steel bars at 1.85c., mill.

A lull has developed in the building field, and there is no new structural inquiry for lots of any size.

Pig Iron.—Sales increased in the past week, during which Cleveland interests closed contracts for 32,000

tons of foundry and malleable iron either for early shipment or the third quarter. Shipments continue fairly heavy and show a gain over those of June, when there was some slowing down for the July 1 inventories. The automotive industry is taking about as much iron as in earlier months of the year, although a large part of that being shipped to automobile foundries this month has been carried over from second quarter contracts. Many consumers are following a hand-to-mouth policy of buying. Furnaces that are in operation still have good stocks, which they do not seem to reduce very much. Prices are holding steady at recent levels. The commonly quoted Cleveland price for outside shipment remains at \$16.50, but \$16.25 and probably lower has not disappeared in competitive sections. While \$16.75 is being quoted in the Valley district, a Lake furnace has taken some business at \$17 for shipment to a point having the same freight rate from both producing points. In Michigan, the market is firm at \$17.50. There is no activity in basic or low phosphorus iron.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25.....	\$18.00
S'th'n fdy., sil. 1.75 to 2.25.....	21 50
Malleable	18.00
Ohio silvery, 8 per cent.....	23.00
Basic Valley furnace.....	16.00
Stand. low phos., Valley furn.....	26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Sheets.—The demand is rather spotty and slowing down, although it is good for this season of the year. Shipments exceed new business, and some of the mills that have had good backlogs are able to make quicker deliveries than recently. The only change in the price situation is the settling of black sheets to a rather common quotation of 2.60c., Pittsburgh. Although that price had appeared recently, it did not become common until the past week. Other sheet prices are unchanged. Blue annealed sheets range from 1.90c. to

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.

Com. wire nails, base per keg.....	2.85

*Net base, including boxing and cutting to length.

2c., Pittsburgh. The minimum on galvanized sheets is 3.40c. and 3.45c., Valley.

Strip Steel.—Demand for both hot and cold-rolled strip shows some tapering off. Most business in hot-rolled material is in specifications against contracts. Plate makers are feeling keenly the competition of hot strip mills on lighter gages. Prices on wide material continue very irregular. Net prices are rather commonly quoted, which in some cases figure below 1.75c., Pittsburgh, on cold-rolled strip, 2.65c., Cleveland, has become more general for 3 tons and over. Small lots are still bringing 2.75c. Fender stock is holding at 4.10c. for No. 20 gage.

Cold-Finished Steel.—Demand from the automotive industry continues fairly active. Some new business is coming from makers of Ford parts. The price is firm.

Old Material.—The market shows little life and a weak tone, although there is no change in prices. Activity during the week was confined to small purchases of heavy melting steel and blast furnace scrap, mostly for delivery to Cleveland mills against outstanding orders. These brought quoted prices, except on some No. 1 heavy melting steel scrap for a mill exacting in its requirements, for which dealers paid \$13.50. The market is weak in the Valley district. Dealers are paying \$14 for No. 1 heavy melting steel for Youngstown and Sharon deliveries.

Prices per gross ton, deliv'd consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$13.00 to \$13.25
No. 2 heavy melting steel.	12.50 to 12.75
Compressed sheet steel.	12.50 to 13.00
Light bundled sheet	
stamp'gs	11.50 to 11.75
Drop forge flashings.	11.50 to 11.75
Machine shop turnings.	7.00 to 7.25
No. 1 railroad wrought.	11.50 to 12.00
No. 2 railroad wrought.	13.50 to 13.75
No. 1 busheling.	11.00 to 11.25
Pipes and flues.	9.00 to 9.50
Steel axle turnings.	12.50 to 13.00
Acid Open-Hearth Grades	
Low phos. forging crops.	16.50 to 17.00
Low phos. billet, bloom and slab crops.	17.00 to 17.50
Low phos. sheet bar crops	16.50 to 17.00
Low phos. plate scrap.	16.00 to 16.50
Blast Furnace Grades	
Cast iron borings.	9.00 to 9.25
Mixed bor'gs and short turn'gs	9.00 to 9.25
No. 2 busheling.	9.00 to 9.25
Cupola Grades	
No. 1 cast.	16.00 to 16.50
Railroad grate bars.	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	16.75 to 17.25
Miscellaneous	
Railroad malleable	15.00 to 15.50
Rails for rolling.	16.25 to 16.50

Coke.—A large share of foundries are under contract and new demand for foundry coke is limited to car lots. Prices are unchanged at \$7.75, Painesville, for Ohio by-product foundry coke and \$3.25 to \$4.85 for Connellsville foundry coke. There is some activity in by-product coke for industrial uses. This is quoted at \$4.50, Ohio ovens, for both egg and nut grades.

Bolts, Nuts and Rivets.—The demand continues fair in specifications against contracts. The volume of or-

ders is about the same as last month.

Semi-Finished Steel.—Specifications are holding up well, but there is little new business. Quotations are unchanged at \$32.50 to \$33, Cleveland, for sheet bars, billets and slabs. The higher price evidently applies to orders for shipment to points where the seller has a freight advantage.

Wire Products.—A spurt in wire business has followed the recent \$2 a ton price reduction. Nails are only moderately active. Some pressure is being made by car lot buyers in con-

suming industries to obtain the \$2.55 per keg price that jobbers pay.

Warehouse Business.—Sales, which declined during the holiday week, have again picked up and are about the same in volume as during June. Prices are holding steadily except on black and galvanized sheets, which are reflecting the weakness of mill prices.

Reinforcing Bars.—Demand is slow, being limited to small lots. Prices are irregular. Rail steel bars are commonly quoted at 1.75c., mill.

Youngstown

Steel Production in Mahoning Valley Averages 75 Per Cent, a Gain of 5 Points

YOUNGSTOWN, July 17.—Iron and steel production schedules in the Mahoning Valley average fully 75 per cent this week, a gain of 5 points, compared with the production rate of recent weeks. The increased scheduling is directly attributable to enlarged business and affects steel ingots, pipe and plates in particular. Steel sheets, tin plate and hot strip mills are holding the gains of recent weeks.

Of 53 independent open-hearth furnaces, for example, 38 are scheduled this week, a gain of one over the preceding week and comparing with a recent low of 32 melting. Of 127 Valley sheet mills, 113 are under power, which approaches the high mark of the year. Tin mills are operating close to capacity, with a substantial backlog; a gain is seen in active pipe mills, with 14 of 20 under power.

The Youngstown Sheet & Tube Co.

this week blew out one of its two Hubbard blast furnaces, because of slack operations by the Valley Mould & Iron Corporation nearby. The Hubbard stacks supply hot metal to the Valley Mould company. This leaves 21 of 37 blast furnaces in the Youngstown district in action, producing about 68 per cent of the total rated capacity.

The Carnegie Steel Co. has five of six furnaces blowing at the Ohio works, one being down for overhauling and enlargement. The Sheet & Tube company is operating five of its nine stacks in the Youngstown district, while the Republic company has four furnaces in blast.

Independents will follow the lead of the Carnegie Steel Co. in advancing the price of merchant bars, plates and shapes \$2 per ton, to 2c. per lb. for fourth quarter delivery.

Worcester Manufacturers Working Full Time

Reports from 42 manufacturing plants in the Worcester, Mass., vicinity are regularly made to the local safety council, which not only records the number of lost-time accidents, but the number of employees and the hours worked. From these it may be determined that while the number of men employed is practically the same as a year ago, the number of hours worked almost doubled.

As summarized in a bulletin issued by the Worcester Bank & Trust Co., it appears that in May, 1928, 23,417 people employed in forty-two manufacturing plants of Worcester and vicinity worked 4,936,776 man hours. In May, 1927, 23,228 employees of the same plants worked 2,812,855 hours.

The number of employees increased but slightly, comparing the month this year and last. But the total number of hours worked by them increased tremendously. The gain of 2,123,921 hours was 80 per cent. Average daily employment per person increased from five hours to eight hours. The reporting plants include most of the large

establishments of the city; among them are the American Steel & Wire Co., Crompton & Knowles Loom Works, Norton Co., Reed & Prince Mfg. Co., Graton & Knight Mfg. Co., Wickwire-Spencer Steel Co., the Whitin Machine Works and the American Optical Co. There is no reason to doubt that local plants not included in the group of forty-two have averaged to have much the same experience.

Building permits have dropped very sharply. The city, therefore, has the conflicting experience of full-time employment in manufacturing and considerable unemployment in the building trades.

The satisfactory condition of dealer stocks of used automobiles makes possible the promotion of new car sales on a larger basis than usual during the summer months, says *Automotive Industries*. This year the new car sales records of the spring and early summer have been accompanied by a more even movement of used cars, resulting only in limited stocks at any time in the past two months.

San Francisco

Improved Steel Demand—Water Mains for Oakland —Heavy Concrete Bar Business

SAN FRANCISCO, July 14 (*By Air Mail*).—Third-quarter trading is getting well under way and demand has improved during the past two weeks. A number of new structural steel projects have come out for figures and architects and engineers report a good volume of business on the boards which should come forth for bids shortly. Reinforcing steel bars and shapes continue to be the most active products. Of more than usual interest is the call for bids by the East Bay Municipal Utility District, Oakland, for a water distributing system calling for 4500 tons of plates or 22,000 tons of cast iron pipe.

Building permits issued during June in Los Angeles totaled \$9,190,434, as compared with \$9,355,175 for the same month a year ago. Seattle had the biggest building month in the history of the city, as noted last week. Portland's permits totaled \$2,639,753, a gain of \$270,612 over June, 1927. Oakland was the third leading city on the Coast during June, with a total of \$4,209,512.

Pig Iron.—The foundry trade, with the exception of those classes of plants engaged in producing sanitary ware, stoves and other manufacturing specialties, continues to operate upon a limited basis, with only sufficient advance orders on hand to keep them running a day or two. The majority of the foundries on the Pacific Coast are classified as jobbing plants, and demand and sales have not been heavy. A shipment of Indian iron has just been unloaded on the Coast, 300 tons going to Bay district melters and 300 tons to users in the Los Angeles district. No change in prices is noted.

Prices per gross ton at San Francisco:

*Utah basic.....	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing steel bars were the heaviest in over five weeks and totaled 1756 tons, as noted elsewhere. Outstanding among pending business is 2288 tons for a drainage improvement project at Los Angeles and 400 tons for highway in Ventura County, Cal. Prices on out-of-stock material in the San Francisco district have strengthened to some extent and while better than 2c. is being quoted occasionally, this figure now represents the general run.

Plates.—One of the largest plate inquiries that has come before plate

fabricators this year calls for 4500 tons for small water mains in Oakland for the East Bay Municipal Utility District, bids on which go in Aug. 17. Alternate bids will also be taken on steel lined concrete pipe, lock-bar, electric welded steel pipe and cast iron pipe. H. Gould of Sacramento secured the only award, which involved 100 tons of 24-in. riveted steel pipe for Sacramento. Prices continue to range from 2.25c. to 2.30c., though a large tonnage, it is believed, would probably bring forth 2.20c. c.i.f.

Shapes.—Demand for structural steel shapes continues active and awards recently totaled over 3300 tons. Included among the new pending projects are 455 tons for a bridge at Sausalito, Cal., 600 tons for an apartment in San Francisco, 570 tons for a bridge at Ventura, Cal., and 200 tons for a viaduct in Seattle. Plain material is firm at 2.35c. c.i.f.

Cast Iron Pipe.—A slight improvement in demand for cast iron pipe is noted, although sales this week were limited to one or two projects. Burbank, Cal., placed 109 tons of 4-in. Class B pipe with the Grinnell Co., 67 tons of 6-in. Class 250 with the Pacific States Cast Iron Pipe Co. and 87 tons of 8 and 10-in. Class 250 with the

American Cast Iron Pipe Co. San Diego awarded the Miracle Construction Co., San Diego, 102 tons of 4 and 6-in. Class B. The B. Nicoll Co. took 149 tons of 14-in. Class B for Puyallup, Wash., and I. L. Ryder, San Carlos, Cal., secured 109 tons of 3 to 6-in. Class 150 pipe for San Luis Obispo, Cal. The quantities involved in the East Bay Municipal Utility District project are as follows: 3600 tons of 44-in., 9000 tons of 30-in., 325 tons of 34-in., 6600 tons of 36-in. and 2800 tons of 24-in. Class C pipe. Bids on this material will be opened Aug. 17. The Pacific States Cast Iron Pipe Co. was low bidder on 202 tons of 2 to 6-in. Class B pipe for Phoenix, Ariz. Wells, Nev., which last month took figures on 224 tons of 4 to 10-in. Class C pipe, finally purchased Armco iron pipe through the Burnham Mfg. Co. at Cross, Utah. Bids have been opened on 2121 tons of 8 and 12-in. Class 350 pipe for Los Angeles and on 271 tons of 48-in. pipe for a sewer in Seattle, Wash. New inquiries include 133 tons of 6 to 10-in. Class B pipe for South Pasadena, Cal., bids opening July 25. Tracy, Cal., will open bids on Aug. 7 for 416 tons of 4 to 12-in. Class B.

Steel Pipe.—Little new business in standard pipe and oil country goods has been reported of late. John Strona, Pomona, Cal., secured 194 tons of 4-in. standard and 6-in. O. D. pipe for Chino, Cal. No large inquiries are pending.

Coke.—One large importer of English coke has just unloaded 3500 tons of beehive and by-product coke in San Francisco to apply against contracts placed some time ago. Approximately 1500 tons of this material will be reshipped to Portland and Seattle. English beehive coke is quoted at \$16 a net ton, delivered incoming dock, while by-product material ranges from \$11.50 to \$13 a net ton.

Canada

New Business Active and Operations Maintain Recent High Level—Strong Structural Demand

TORONTO, July 17.—New business and operating activities of the iron and steel and allied industries of Canada continue to hold the high position reached earlier in the year, and at the moment the various companies concerned believe the present rate of operations will continue for some months to come.

While rail mills have secured considerable orders from the Canadian railroads, rolling stock manufacturers have not been so fortunate, and the latter point out that the roads continue to hold their rolling stock purchases to a minimum, despite the fact that there is apparently a strong need for replacements. Most concerns producing rolling stock have entered into the manufacture of mining equipment or some other special line and it is to the latter that credit is given for the continued high rate of operations. The automotive industry of this country is also flourishing. Agricultural implement makers are experiencing one of their best years and sanitary ware and radiator manufacturing

companies also are optimistic in their statements regarding present and future activities.

Pig Iron.—Following the lull during the first week of July, business has again returned to the stronger position. Some advance buying has been done, totaling about 3000 tons for third-quarter delivery. The majority of consumers, however, have covered up to the end of September, and local blast furnace representatives do not expect much additional in the way of big tonnage forward contracts. Spot buying in lots of from one to two cars is the feature, and as orders of this nature are fairly numerous, total sales for the week reached a good level. A few inquiries

Cement c'd nails, 100-lb. keg.....	3.40

are out for 200 to 300 tons for immediate delivery, which are expected to be closed within the next few days. Prices appear firm at the present level, with little prospect of an early change here. In the Montreal district, however, shading is being resorted to in order to meet outside competition, but the general list is unchanged.

Prices per gross ton:

Delivered Toronto			
No. 1 fdy., sil	2.25 to 2.75	\$23.10 to	\$23.60
No. 2 fdy., sil	1.75 to 2.25	23.10 to	23.60

Imported Iron, Montreal Warehouse			
Summerlee			33.50
Carron			33.00

Structural Steel.—While a few orders of 1000 tons and upward were closed during the week, the total volume of sales were somewhat below those of the three or four weeks previous. A few big orders are in prospect, but the bulk of current business is for small tonnages. It is expected that the T. Eaton Co., Toronto, will require perhaps 10,000 tons of steel for its new structure. Approximately 2000 tons of structural and 500 tons of reinforcing bars will be required for the Miller Court & Co., Ltd., Stock Exchange Building, Vancouver, and 600 tons of reinforcing bars will be purchased for the factory and stores on Mount Royal Avenue, Montreal, for the Canadian Waist Co. Numerous other orders are pending in which from 100 to 500 tons of steel will be required. Canadian structural steel fabricators

and producers of reinforcing bars report plant operations at capacity, with some working at double time to supply the demand.

Old Material.—Sales for the past few days showed general improvement. The seasonal decline in business has not been so striking as it was a year ago. With the majority of consumers who place advance contracts covered up to the end of September, current demand is mostly for small tonnages for immediate delivery. The consumption of old material throughout eastern Canada is from 15 to 20 per cent greater than a year ago, and scrap dealers are naturally securing a larger volume of business. The present price situation, however, is far from satisfactory. A general strengthening of the United States market is about the only possibility Canadian dealers have of a stronger market demand and higher prices here. Prices are unchanged.

Dealers' buying prices:

St. Louis

Reduced Pig Iron Price to Stimulate Buying—Improvement in Steel Business

ST. LOUIS, July 17.—Although the St. Louis Gas & Coke Corporation has not formally reduced its price in line with the cut of 50 cents a ton made by Chicago makers, as reported in THE IRON AGE last week, the Granite City

concern has let it be known that it will meet all competition, and has been making sales on the basis of the new Chicago price when necessary. Its sales last week totaled 4500 tons, including 2000 tons of basic to an East Side melter and 2500 tons of foundry iron in lots tapering downward from 500 tons, which went to a St. Louis melter. The new Chicago price, the lowest since 1915, is expected to stimulate buying in this district, especially as there is considerable iron to be bought for the third quarter, and sellers look for a heavy movement this week. While there are no definite inquiries pending, a number of melters are said to be ready to buy.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.....	\$19.00
N'th'n No. 2 fdy., deliv'd St. Louis.	20.16
Southern No. 2 fdy., deliv'd.....	19.92
Northern malleable, deliv'd.....	20.16
Northern basic, deliv'd.....	20.16

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Dealers in domestic grades of coke have shown very little interest so far in their requirements for next

fall, and it is not expected that they will do so until after Aug. 1. Buying of foundry grades is light.

Old Material.—About the only item on the old material list that is showing any life is rails for rerolling, the various rolling mills in the district showing greater activity than other consumers. Buying of other items is light, and neither dealers, who are about covered on contracts, nor consumers, who say they have sufficient stocks of old material for the present, are showing any interest in the market. Miscellaneous standard section rails, railroad springs, and cast iron car wheels are 25c. lower; steel car axles, wrought iron bars and transoms and No. 1 railroad wrought are 50c. lower. Railroad lists, which continue heavy, include the following: Southern Railway system, 6962 tons; Chesapeake & Ohio, 4262 tons; Terminal Railway Association of St. Louis, 3523 tons; Chicago, Milwaukee & St. Paul and Chicago & Alton, 1300 tons each; Chicago, Rock Island & Pacific, 1500 tons; Nickel Plate, 600 tons miscellaneous, and four carloads of rail; Texas & Pacific, 575 tons miscellaneous and 250 tons axles; International-Great Northern, 885 tons; Cotton Belt, 14 carloads; and Pullman Co., St. Louis, four carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$10.75 to \$11.25
No. 1 locomotive tires....	12.00 to 12.50

Relay. rails, 60 lb. and under.....	20.50 to 23.50
Relay. rails, 70 lb. and over.....	26.50 to 29.00

Finished Iron and Steel.—The Granite City Steel Co., during its shutdown for the week of the Fourth, was able to book a very fair backlog tonnage, and all of its units are operating 100 per cent, except the galvanizing department, which is at about 80 per cent of capacity, as compared to 50 per cent two weeks ago. The last few days have shown a marked improvement in incoming business, which is slightly behind the corresponding period in June, but well up to the normal for this time of year. Demand is coming from a diversified line of consumers, and the volume is being maintained despite virtual inactivity of car builders and oil field operators, who ordinarily use large tonnages. Prices are considerably more stable than they were a few weeks ago, although still unsatisfactory, due to very low levels. Warehouse busi-

ness for June was better than May, and July so far has been fair, buying in the St. Louis industrial district holding its own, but with declines in the oil fields and other country sec-

tions. Railroads are expected to issue third-quarter requisitions for plates, shapes and bars during the week. Business with structural fabricators is quiet.

they are \$3.40 per keg, and for mill shipments, \$2.65 in car lots and \$2.90 in less than car lots. New extras have been issued on cut nails, which brings the average cost to buyer practically to the wire nail basis.

Boston

Structural Fabricators Well Filled Up With Orders—More Steel Scrap Exported

BOSTON, July 17.—The Chapman Valve Mfg. Co., Springfield, Mass., is now said to have bought 500 tons No. 2 plain New York State pig iron for third and fourth quarter delivery, 500 tons No. 2X Buffalo, and 500 tons No. 1X Buffalo iron, the latter from a steel mill, at prices above those quoted on other irons. The foundry's original inquiry was for 2500 tons. The major portion of iron sold in this territory the past fortnight has been bought on a basis of \$17 a ton, Buffalo furnace, for No. 2X, despite the fact that irons are still available at \$16 and \$16.50 a ton, base Buffalo furnace, or the equivalent. Aside from the Chapman Valve Mfg. Co. business, sales the past week were largely of car lots of more or less special analysis irons, for which full differentials were paid.

Foundry iron prices per gross ton deliv'd to most New England points:

Buffalo, sil. 1.75 to 2.25..	\$20.91 to \$21.91
Buffalo, sil. 2.25 to 2.75..	21.41 to 22.41
East. Penn., sil. 1.75 to 2.25	23.15 to 23.65
East. Penn., sil. 2.25 to 2.75	23.65 to 24.15
Va., sil. 1.75 to 2.25.....	25.71
Va., sil. 2.25 to 2.75.....	26.21
Ala., sil. 1.75 to 2.25.....	22.41 to 24.27
Ala., sil. 2.25 to 2.75.....	22.91 to 24.77

Freight rates: \$4.91 from Buffalo, \$3.65 from eastern Pennsylvania, \$5.21 all rail from Virginia, \$6.91 to \$8.77 from Alabama.

Coke.—July shipments of by-product foundry coke have been a little ahead of those in July, last year. New England melt of iron is not increasing, although certain foundries are busier than they have been. The New

England Coal & Coke Co. and the Providence Gas Co. are still making shipments on a basis of \$11 a ton within a \$3.10 freight rate zone.

Shapes and Plates.—New England steel fabricators have more unfilled business on their books than in a long time. Based on present operations, some of them are booked through the remainder of 1928, while the largest, with increased operations, are sold up through September. Prices named by fabricators are on a firmer basis. Mill deliveries are becoming uncertain, and mills are more often obtaining 1.90c. per lb., base Pittsburgh. Most of the large fabricators are protected through the third quarter at second quarter prices for both plates and shapes.

Warehouse Business.—The movement of iron and steel out of warehouse is holding up remarkably well for July. Small iron workers, although not as active as they were a month ago, continue to take good weekly tonnages from warehouses, mostly of round and square bars and angles. Warehouse stocks today are considerably smaller than they were a year ago, consequently there is more or less buying among the trade to fill orders. Wire nails have been cut 5c. to 10c. per 100 lb. From stock

Old Material.—A steamer with 4303 tons of scrap cleared Boston on July 10 for Danzig. This shipment included rails as well as No. 1 and No. 2 steel. Another steamer will load 4000 to 5000 tons for export within the next fortnight. Prices for material on this boat have been dropped about 25c. per ton, No. 1 steel now fetching \$9 a ton on cars dock, here, and No. 2, \$8.50 to \$8.75. Aside from the export demand, the old material market is quiet. Prices Pennsylvania mills are willing to pay for scrap are so low that shippers cannot do business except at a loss. To illustrate: the best a Weirton mill is offering for No. 1 heavy melting steel is \$6.70 to \$6.75 a ton on cars at shipping point. With a \$2 a ton cost for handling, plus the cost of other incidentals, shippers cannot profitably operate.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.	\$8.00 to \$8.50
Scrap T rails.....	8.00 to 8.50
Scrap girder rails.....	7.50 to 8.00
No. 1 railroad wrought...	9.00 to 9.50
No. 1 yard wrought.....	7.00 to 7.50
Machine shop turnings...	5.00 to 5.50
Cast iron borings (steel works and rolling mill)..	5.10 to 5.60
Bundled skeleton, long....	6.50 to 7.00
Forge flashings.....	6.50 to 7.00
Blast furnace borings and turnings.....	5.00 to 5.50
Forge scrap.....	5.50 to 6.00
Shafting.....	12.00 to 12.50
Steel car axles.....	14.50 to 15.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	7.00 to 7.50
Rails for rolling.....	9.50 to 10.00
Cast iron borings, chemical	9.50 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast.....	\$13.50 to \$14.00

Railroad malleable.....	13.50 to 14.50

Birmingham

Steel Backlogs Being Maintained With Finishing Mills Active—Price Tendency Firm

BIRMINGHAM, July 16.—New sales by pig iron producers last week showed slight improvement over the previous week. Total bookings were ahead of production. Some consumers are covering their requirements through July and August and a few orders have been booked as needs are presented. Pressure pipe makers are among the heavy buyers. Soil pipe plants, stove foundries and machine shops generally are largely uncovered for the quarter's requirements. Shipments are active and ahead of the make. For the past several days the Tennessee company has been alternating its Ensley furnaces between basic and foundry iron with changes being made each day. The No. 2 Bessemer furnace of the company has been changed from recarburizing iron to foundry iron. Operations by the other

companies are the same as last week. Seventeen furnaces are in blast.

Prices per gross ton f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic.....	\$15.00 to 16.00

Finished Steel.—The volume of new business for the past week was close to that of the past several weeks. The finishing mills continue active and backlogs are being maintained so far. Prices show a firmer tendency than for several weeks. Bar quotations are now 2.05c. to 2.15c. New bookings of bar manufacturers and structural steel fabricators will easily support operations at the recent level. Structural steel orders booked by the Virginia Bridge & Iron Co. call for 1530 tons, as reported elsewhere. The Tennessee company has taken off all of its open-hearth furnaces at Ensley

and increased its active open hearths at Fairfield from five to six. The Gulf States Steel Co. continues to work three at Alabama City.

Cast Iron Pipe.—New lettings have improved somewhat and are now holding up the unfilled tonnage at a satisfactory level. Inquiries are confined largely to private business. The pressure pipe plants in the district are operating at around 85 per cent capacity and shipments lately have been sufficient to take care of all pipe produced. The soil pipe business is still backward and plant operations are light. Quotations continue at \$34 to \$35 on 6 in. and larger sizes.

Coke.—Shipments are keeping up well, but there is little new contracting on foundry coke, as most consumers have already covered for the last half. A small amount of spot busi-

ness is being transacted. Quotations remain at \$5 for both spot and contract.

Old Material. — Practically no change can be detected in the market. The only activity is found in a few sales from time to time in carload lots. There has been no demand in several weeks. Prices are nominal and unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to	\$9.00
Scrap steel rails.....	11.00 to	11.50

Cincinnati

Revival of Interest in Pig Iron—Coke Prices Decline —Steel Prices Firmer

CINCINNATI, July 17.—Pig iron buyers are showing greater interest in requirements for the remainder of the year and consequently sales and inquiries are tending upward. Significance is attached to the fact that the Standard Sanitary Mfg. Co. is expected to purchase foundry iron for its Louisville, Ky., plant this week, while a large consumer at Hamilton, Ohio, probably will close in a few days for 5000 tons to be shipped during the last half. At Piqua, Ohio, the Favorite Stove & Range Co. is asking for bids on 600 tons of foundry. The amount of iron being taken by melters on current contracts is fairly satisfactory for the summer season. Competition for business is principally between Lake Erie furnaces and a southern Ohio producer.

In the case of the former, quotations ranging from \$16 to \$16.25, base furnace, have been successful in obtaining bookings, but the freight advantage to many points in southern Ohio is strongly in favor of the latter. Southern Ohio foundry iron remains nominally at \$18, base Ironton. However, the two merchant iron interests at Ironton have only a limited tonnage of iron, mostly in special grades, to offer. There is little likelihood of either company resuming operation of its blast furnaces in the near future. Tennessee and Alabama irons are firm at \$15.50, base Birmingham. There has been no change in Jackson County silvery, which is steady at \$25, base Jackson, for 8 per cent.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25.....	\$19.89
So. Ohio malleable.....	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25..	19.19
Ala. fdy., sil. 2.25 to 2.75..	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—There is an underlying tone of firmness to the market. Orders and specifications have called for small miscellaneous lots of material, but in the aggregate have attained somewhat liberal proportions. Bars, structural shapes and plates are in fair demand at 1.85c., base, Pittsburgh, for attractive tonnages and 1.90c. for the ordinary run of orders. In common wire nails there has been a firming up of prices. Some Eastern producers have announced that they will not sell nails under \$2.76 per keg, delivered in Cincinnati, which is equivalent to \$2.55, Pittsburgh, plus the full all-rail rate to this city. However, at least two makers are willing to accept business at \$2.69, figuring on a base price of \$2.55 and a 14c. barge rate from Ironton to Cincinnati. District sheet mills report that bookings are holding up well in the face of a slackening in operations among certain classes of consumers. The output of steel sheets continues at about 90 per cent of capacity, but backlogs have been re-

4-in.	39.00

duced in the past few weeks so that the maintenance of present schedules will depend upon the amount of tonnage obtained in the next week or two. Quotations have not changed and indications are that the market is becoming stabilized at current prices of 2c., base Pittsburgh, for blue annealed, 3.50c. for galvanized, 2.65c. for black and 4c. for automobile body stock. Reinforcing bars are firm at 1.80c., base mill, for rail steel material and 1.85c. to 1.90c., base Pittsburgh, for new billet bars.

Warehouse Business. — Shipments out of local warehouses in the first half of July were slightly less than in the last two weeks of June, the lagging demand for structural steel having been responsible for the decline in volume. Prices are steady and unchanged.

Coke.—The coke market is rather sluggish and the downward trend of prices, especially in by-product grades, reflects the increasing severity of competition among makers. An Indianapolis company has cut its price of foundry coke \$1 a ton for delivery to points in Indiana. The decline was caused by low quotations made by a Birmingham producer and by a Terre Haute, Ind., maker. However, the schedule for delivery to this city remains unchanged at \$7 per net ton, f.o.b. ovens. Whether this price will be shaded depends upon the course taken in the next week or two by an Ashland, Ky., manufacturer. The Procter & Gamble Co., Cincinnati, is reported to have bought 5000 tons of by-product furnace coke from a southern Ohio seller. In recent years this business has gone to a Wise County producer of beehive coke. An Ohio River user of furnace coke is inquiring for 2500 tons for delivery in the first three months of 1929.

Foundry coke prices per net ton deliv'd Cincinnati: By-prod. coke, \$9.02; Wise County coke, \$7.09 to \$7.59; New River coke, \$9.09 to \$9.59. Freight rates, \$2.14 from Ashland, Ky.; \$2.59 from Wise County and New River ovens.

Old Material. — There has been little activity in the scrap market. Railroads are reported to have got fairly good prices for the items on their July lists. Steel plants in this district are accepting moderate tonnages on present contracts. Blast furnace and foundry grades are quiet. Prices are unchanged.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$10.75 to \$11.25
Scrap rails for melting....	10.75 to 11.25

Detroit

June Automobile Production Records Considerably Ahead of June, 1927—Employment Gains

DETROIT, July 16.—Final figures for June indicate that automobile production is not undergoing the usual seasonal slump. Some individual companies are still making records and the industry as a whole is in very much better condition than it was at this time last year. It is apparent that Chevrolet production made a new record, with an output of approximately 130,000 cars and trucks, or better than 20,000 ahead of June, 1927, but 10,000 units less than the previous month of this year. The basic schedules for the next three months are set at 100,000 units a month. The Chevrolet company is about to begin construction on a new foundry unit at Saginaw, which will cost approximately \$4,000,000 and have a melting capacity of 1700 tons a day.

Dodge production since the first of the year is approximately 20 per cent ahead of the same period of 1927. June production of Graham-Paige Motors Corporation has for the fourth time broken records, with a total of 8829 units, showing an increase of 318 units over the previous month. The Hudson Motor Car Co. shows a June record of 31,160 units, which may be compared with 23,084 units for June of 1927. The first six months of the current year show a total of 183,065 as against 168,336 for the first six months of 1927. The Hupp Motor Car Corporation in the first six months of 1928 shipped 38,424 cars. This compares with 22,310 cars in the six months of 1927. Shipments to Canada reflect the same progress. June, 1928, is the largest June in this respect and 7 per cent ahead of June, 1927.

Marmon production for the first six months of this year totals approximately 13,900 cars compared with 7311 for the same period of 1927. The Oakland Motor Car Co., to July 1, shows a total sales of 161,548 units, or a gain of 62 per cent over the first half of 1927. The Packard Motor Car Co., after two weeks shut-down for vacations, has resumed operations at full capacity. A new record was made last month by Reo Motor Car Co., with 6133 units, compared with 6121 in the previous month and with 4479 in June of last year. The Studebaker Corporation shows a June total of 13,000 units as compared with 8600 for June a year ago.

The index for the Employers' Association shows an increase of 1822 for the past week, bringing the total to 264,473, which represents the combined payrolls of approximately two-thirds of the city's industries. The corresponding figure for a year ago was 194,704 persons or 69,769 less than at the present time.

President Kuhn of the Truscon Steel Co. states that all the company's plants are running at capacity and

with no immediate let down apparent.

The Motor Wheel Corporation sales for the first half of 1928 are somewhat more than \$13,000,000 or 25 per cent better than the sales for the same period of 1927. An addition to the pressed steel plant is to be started immediately and will be rushed to completion as early as possible this fall. This addition will be approximately 74 x 500 ft.

Auto body sheet stands at 4c., Pittsburgh, and blue annealed sheet at 2 to 2.10c., Pittsburgh. Cold finished bars remain at 2.10c., Pittsburgh, and hot rolled 3 in. and narrower 2.20 to 2.30c., 3 to 6 in., 1.85

to 2.10c., and 6 in. and wider 1.75 to 1.90c., Pittsburgh. Structural bars, shapes and plates remain at 1.85c. to 1.90c., Pittsburgh.

Shipments of pig iron in this district are considerably above the June figures. This is due to heavy production of automobile castings for new models. Melters generally have covered for the third quarter and they anticipate good production during this period.

Scrap prices are unchanged.

Dealers' buying prices per gross ton f.o.b. cars, Detroit:

Hvy. melting and shov.	
steel	\$11.00 to \$11.50
Borings and short turnings	7.00 to 7.50

Flashings	9.00 to 9.50

Buffalo

Steel Mill Operations Average 80 Per Cent—10,000-Ton Sale of Heavy Melting Steel at \$13.75

BUFFALO, July 17.—With very few sizable inquiries out, a fair tonnage of pig iron has been sold in 50 to 200-ton lots. The price realized on sales in the district was \$17, Buffalo. Most of the business placed at points to the east has been sold at a price which figures back to \$16.50, Buffalo, taking the barge rate into consideration. An inquiry is out for 1000 tons of malleable and another from Connecticut is for 600 tons of malleable and silvery iron.

In line with the Hanna Furnace Co.'s improvement program at Buffalo, its No. 1 stack, which is now operating on silvery iron, will be blown out about Aug. 1 and one of its larger furnaces, recently equipped to produce silvery iron, will then go onto that grade for regular production.

Basic	17.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Mill operation is at about 80 per cent, with bookings fair. Bars, shapes and plates are being quoted at 2c., Buffalo, for third quarter delivery. Considerable sheet business has been taken. On black sheets, prices range from 2.60c. to 2.70c. Shop operations are better,

with drop forging shops doing particularly well. The largest structural letting was 400 tons for the Mayflower apartments.

Old Material.—A local mill has bought 10,000 tons of heavy melting steel at \$13.75. A few small sales of No. 1 cast, malleable and short steel rails have been made, but otherwise the market has been very quiet. The restrictions and suspensions put into effect by the two largest consumers are still in effect. Most of the scrap yards are shut down.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	\$13.75 to \$14.25
No. 2 heavy melting steel	12.25 to 12.75
Scrap rails	13.00 to 13.50
Hydraulic comp. sheets	12.25 to 12.75
Hand bundled sheets	8.00 to 8.50
Drop forge flashings	12.00 to 12.50
No. 1 busheling	12.25 to 12.75
Hvy. steel axle turnings	12.00 to 12.50
Machine shop turnings	7.00 to 7.50

Acid Open-Hearth Grades	
R'l'r'd knuckles and couplers	15.00
R'l'r'd coil and leaf springs	15.00 to 16.00
Rolled steel wheels	15.00
Low phos. billet and bloom ends	16.00 to 16.50

Electric Furnace Grades	
Hvy. steel axle turnings	12.00 to 12.50
Short shov. steel turnings	9.00 to 9.50

Blast Furnace Grades	
Short shov. steel turnings	9.00 to 9.50
Short mixed borings and turnings	9.00 to 9.50
Cast iron borings	9.00 to 9.50
No. 2 busheling	9.00 to 9.25

Rolling Mill Grades	
Steel car axles	15.50 to 16.00
Iron axles	19.50 to 20.00
No. 1 railroad wrought	12.00 to 12.50

Cupola Grades	
No. 1 machinery cast	14.25 to 14.75
Stove plate	13.00 to 13.25
Locomotive grate bars	11.25 to 11.75
Steel rails, 3 ft. and under	16.50
Cast iron carwheels	12.00 to 12.50

Malleable Grades	
Industrial	15.00
Railroad	15.00
Agricultural	15.00

Tin Recovers in More Active Trading — Copper Position Strong — Lead and Zinc Steady

Copper.—Although current buying of copper is light, copper producers are in an unusually strong position, being sold up tightly for July and also almost completely for August. It is difficult for buyers to obtain even a carload for spot shipment, as refiners are reserving their output for contract customers. Some copper for August is still to be bought, while nearly all consumers are uncovered for September. Producers are well satisfied with the present price situation, which is

firm at 14.75c., delivered Connecticut Valley, for electrolytic, and there is no intimation of any intention to go above that level; in fact, producers would prefer to hold it there. Copper statistics for the first half reflect fully the present strong situation, with a reported decrease in refined stocks as of June 30 amounting to 7479 tons, although total stocks, including those in process, gained 2254 tons, the comparisons being made with the situation on the last day of May. Total domestic sales in the first half were 444,028 tons, more than half of the total of 824,844 tons sold in all of 1927, while foreign shipments were 352,088 tons in the six months, against 641,865 tons in the twelve months of 1927.

The foreign demand is not now active, but the price of Copper Producers, Inc., remains unchanged at 15c., c.i.f. European ports.

Tin.—Following several uneventful days, the tin market resumed activity today (Tuesday) with a fairly strong demand, mostly from dealers, for August and September delivery, and the price advanced at the close of the trading to 47.25c. per lb., a gain of 1c. over Monday's price. About 300 tons changed hands. Last week sales were not more than 750 tons at prices fluctuating between 46c. and 46.25c. Consumers have not taken much interest in the market recently, but it is believed that they must soon come in for supplies, as their stocks are not

reckoned as being large. During the dullness which prevailed in the local market last week, London almost completely disregarded the American situation, and the market there has been steady and stronger than here. London prices today were £213 for spot standard, £209 10s. for future standard, £216 for spot Straits, and the Singapore price was £210 15s.

Lead.—This metal has remained steady in price during the past week, with quotations of 6.05c., St. Louis, and 6.20c., New York, the latter being the price of the American Smelting & Refining Co., which is being generally followed in the outside market.

Zinc.—The day-to-day demand for zinc is fairly steady, but the market presents no new characteristics. Prices are firm at 6.20c. to 6.25c., East St. Louis, or 6.55c. to 6.60c., New York. The lower prices are for July shipment, a slight premium being asked for August and September. Ore production at Joplin jumped from 3500 tons in the first week of July to 12,000 tons last week; the ore price remains at \$40 a ton.

Antimony.—The market is quiet but firm, with the Chinese metal quoted at 9.50c. per lb., New York, duty paid, for spot delivery, and at 9.75c. for future.

REINFORCING STEEL

WITH a bridge at Providence, R. I., requiring 1700 tons and 1000 tons in five junior high schools at Chicago, new reinforcing projects announced during the last week amounted to 4900 tons. The following awards total about 2900 tons:

BRIDGEPORT, CONN., 150 tons, building for Post Publishing Co., to Concrete Steel Co.

SCRANTON, PA., 140 tons, Medical-Arts Building, to Kalman Steel Co.

WESTMORELAND AND FAYETTE COUNTIES, PA., 125 tons, road work, Gray Brothers, Youngstown, to Truscon Steel Co.

CHICAGO, 220 tons, Fargo Avenue apartments, to Kalman Steel Co.

CHICAGO, 300 tons, building for William J. Igoe, to Kalman Steel Co.

CHICAGO, 260 tons, garage at 343 South Wabash Avenue, to Joseph T. Ryerson & Sons.

CHICAGO, 225 tons, garage at 914 Fair Oaks Avenue, to Calumet Steel Co.

CHICAGO, 200 tons, Austin High School, to Olney J. Dean & Co.

MAYWOOD, ILL., 200 tons, building for Public Service Co. of Northern Illinois, to American System of Reinforcing; previously reported to an unnamed bidder.

STATE OF ILLINOIS, 120 tons of rail steel bars for road work, to Calumet Steel Co.

ST. LOUIS, 375 tons; hotel at Eighth and Market Streets, 275 tons, and apartment house at Grand Boulevard and Russell Avenue, 100 tons, to Laclede Steel Co.

HELENA, MONT., 156 tons, State bridge on Laurel West highway, to unnamed interest.

Nickel.—Ingot nickel in wholesale lots is unchanged at 35c.; shot nickel is 36c., and electrolytic nickel is 37c. per lb.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 17.—Trade is light in all the metals. Copper has been held firmly for a number of weeks, even when demand has been light. Buyers are finding that they must pay the current price for their accumulating needs, but they decline to buy ahead. Lead has declined mainly because of a reduction of \$2 a ton by the leading producer. Even at the reduced price demand is light and buyers are looking for a further decline. Tin is also lower than a week ago. The old metals are unchanged.

Prices, per lb., in carload lots:
Lake copper, 14.87½c.; tin, 47.25c.; lead, 6.15c.; zinc, 6.30c.; in less-than-carload lots, antimony, 11.25c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

OLYMPIA, WASH., 250 tons, State highway work, to Northwest Steel Rolling Mills.

SEATTLE, 250 tons, James Madison School, to Pacific Coast Steel Co.

SEATTLE, 150 tons, store, Sixth Avenue and Spring Street, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

PROVIDENCE, R. I., 1700 tons, Washington Bridge; Merritt-Chapman & Scott Corporation, general contractor.

EVANSTON, ILL., tonnage not stated, track elevation work for Chicago Rapid Transit Co.

CHICAGO, 1000 tons, five junior high schools.

SACRAMENTO, CAL., 147 tons, bridge over Santa Clara River at Saugus; bids Aug. 1.

SACRAMENTO, 400 tons, paving in Ventura County; Jans & Bressi, Los Angeles, low bidders.

VENTURA, CAL., 118 tons, Bardsdale bridge; bids July 24.

LOS ANGELES, 250 tons, apartment building at 2100 North Vermont Street; bids being taken.

LOS ANGELES, 589 tons, Big Dalton Dam; bids July 30.

SEATTLE, 147 tons, Second Avenue viaduct extension; bids July 27.

ELLENSBURG, WASH., 105 tons, South branch canal, Kittitas division of Yakima project; bids Aug. 7.

SAN FRANCISCO, 200 tons, garage, Jones and Turk Streets; bids being taken.

SAN FRANCISCO, 200 tons, school, Fulton and Masonic Avenues; bids being taken.

RAILROAD EQUIPMENT

EXPORT business continues to feature the railroad equipment market. A Brazilian road has placed 1000 box cars with United States builders, while an Argentine carrier is soon to make inquiry in this country for about 60 locomotives. The Chicago, Rock Island & Pacific has purchased 250 gondola car bodies. Details of the week's business follow:

Chicago, Rock Island & Pacific has placed 250 gondola car bodies and repairs to trucks with Ryan Car Co. This road is also inquiring for 10 air-dump cars.

American Cyanamid Co. has placed 20 hopper cars with General American Car Co.

Argentine State Railways contemplate buying about 60 locomotives.

Central of Vermont is reported to have placed eight locomotives with American Locomotive Co.

Paulista Railway, Brazil, is reported to have placed orders for 1000 box cars with American builders.

Union Railroad is inquiring for two locomotive tenders.

Barrett Co. has ordered 16 tank cars from General American Tank Car Corporation.

Cities Service Co. has ordered four tank cars from General American Tank Car Corporation.

Chicago, St. Paul, Minneapolis & Omaha has made inquiry for four gas-electric rail motor cars.

Illinois Central has bought two air-dump cars from Western Wheeled Scraper Co.

Northern Pacific is inquiring for one steel business car.

Bethlehem Rolling 36-In. Wide-Flange Beams

The Bethlehem Steel Co., which recently added to its line of wide-flange structural shapes a series of 33-in. beams and girders, now announces the rolling within the past few weeks of a series of 36-in. wide-flange beams and girders at its Lackawanna plant, Lackawanna, N. Y. These new sections are the deepest and heaviest beam sections produced in the United States.

The 36-in. I-beams are rolled in weights of 147, 155, 164 and 173 lb. per ft., and the girder beams are rolled in weights of 231, 240, 250 and 260 lb. per ft.

The American Institute of Steel Construction, Inc., has established a Northwestern district office in Milwaukee at 529 Wells Building, 120 East Wisconsin Avenue, in charge of C. Curtis Tracy, formerly structural engineer with Densmore, LeClerc & Robbins, Boston. The district embraces the States of Wisconsin, Minnesota, North and South Dakota, Montana and Wyoming.

PERSONAL

FRANK D. CARNEY of Carney & Lindemuth, 40 Wall Street, New York, consulting engineers, sailed July 14 on the *Minnewaska*, for a three months' tour of Europe to visit British and Continental steel plants. His permanent address will be in care of the American Express Co., London.

WALTER H. WIEWEL, for the past three years New York district sales manager for the Standard Seamless Tube Co., Pittsburgh, has been appointed New York district manager of steel sales for the Timken Roller Bearing Co., Canton, Ohio, with headquarters at 16 West Sixtieth Street. His previous experience in the steel business includes four years in the Cleveland office of the Cambria Steel Co., Johnstown, Pa., and 11 years with the United Alloy Steel Corporation, Canton.

J. E. HALL, associated for 16 years with Hill, Clark & Co., Boston machinery dealers, and with their successors, Stedfast, Roulston & Co., has joined the machine tool sales department of the Triplex Machine Tool Co., 50 Church Street, New York.

J. R. LOVEJOY, George F. Morrison and B. G. Tremaine, directors and prominent in the management of the General Electric Co., Schenectady, N. Y., were elected honorary vice-presidents of the company, a newly created position, at a recent meeting of the board. Mr. Lovejoy has been associated with the company for 42 years, a vice-president since 1907 and most recently has served as president of the General Electric Employees Securities Corporation. Mr. Morrison, a vice-president since 1916, has been identified with the company for 45 years and has been particularly active in the development, manufacture and sale of incandescent lamps. Mr. Tremaine was one of the organizers of the National Lamp Division of the company and has long been associated with its incandescent lamp business. T. W. Frech, manager of the incandescent lamp department, has been appointed vice-president in charge of the incandescent lamp department. He has been identified with the company since 1901 and manager of the lamp department since 1927. Dr. Willis R. Whitney, who has been director of the General Electric research laboratory since 1900, has also been made a vice-president and will continue as director of research.

SAMUEL C. REBMAN has been appointed district sales manager in the anthracite district of Pennsylvania for the Sweet's Steel Co., Williamsport, Pa., and will have headquarters at 508 Miners Bank Building, Wilkes-Barre. He began his career in 1890 in the employ of the Mahoning Rolling

Mill, Youngstown, and in 1904 became manager of sales of the Danville Structural Tubing Co., Danville, Pa. When the company was purchased by Charles M. Schwab in 1915, Mr. Rebman became vice-president and treasurer, continuing in that position until 1926. For the last two years he has been district sales manager for Steel & Tubes, Inc., New York.

DONALD M. MACDONALD, formerly associated with the engineering department of Stone & Webster, Inc., Boston, has been placed in charge of an office which has been opened at 101 Tremont Street, Boston, by the Pittsburgh Testing Laboratory, Pittsburgh.

GRANT B. SHIPLEY, chairman and president of the American Mond Nickel Co., Century Building, Pittsburgh, United States branch of the Mond Nickel Co., Ltd., London, England, has been elected a director in the parent company.

R. W. HOYT, formerly of Alfred Gardner & Co., Chicago, has joined the sales organization of the Foote Brothers Gear & Machine Co., Chicago, and will cover the territory on the south side of Chicago extending from Roosevelt Road to Sixty-third Street.

W. C. GOODWIN, formerly section engineer of the control engineering department, has been appointed manager of the renewal parts engineering department of the Westinghouse Electric & Mfg. Co. In August, 1926, Mr. Goodwin went to England as liaison engineer for the Westinghouse company with European companies with which the Westinghouse company has relations. He represented the Westinghouse engineering department in Europe for almost two years, spending time in England, France, Italy, Norway, Germany and Czechoslovakia. Mr. Goodwin is a member of the American Institute of Electrical Engineers, a former secretary of the Pittsburgh section of that organization, and is also a member of the Engineering Society of Western Pennsylvania.

E. H. GERBERDING has been made assistant treasurer of the Westinghouse Electric & Mfg. Co., East Pittsburgh. He began work in the company's treasury department 28 years ago, and has been continuously employed in the same department since that time.

DR. EDWARD DEAN ADAMS, consulting engineer, New York, who was chairman of the committee on war memorials to American Engineers and represented the Engineering Foundation at the dedication of the library

and engineers' memorial carillon and clock at Louvain, Belgium, July 4, received an honorary doctorate from the University of Louvain and was made commander of the Order of the Crown by the Belgian Government.

BLAKE R. VANLEER, assistant professor of mechanical engineering at the University of California, Berkeley, has been appointed assistant secretary of the American Engineering Council, succeeding A. C. Oliphant, who has resigned.

LOUIS SCHLESINGER, president Bradley Wash-Fountain Co., 2203 Michigan Street, Milwaukee, manufacturer of sanitary equipment for industrial and institutional purposes, has disposed of his interest in that company to H. A. Mullett and associates and is retiring. Mr. Mullett has been elected president; G. W. Grossenbach, vice-president; E. S. Wetherell, secretary, and R. H. Weins, treasurer.

PAUL M. TYLER, identified with the Metals Section of the United States Tariff Commission, has resigned and has become associated with the economics branch of the Bureau of Mines, Department of Commerce.

LEYS A. FRANCE, Cleveland, has been appointed assistant trade commissioner at Montreal.

DR. R. H. PATCH, assistant to the president of E. F. Houghton & Co., Philadelphia, was elected chairman of the Philadelphia chapter of the American Society for Steel Treating at the annual meeting held recently at the plant of the Edward G. Budd Mfg. Co. H. E. Allen, metallurgist Henry Disston & Sons Co., Inc., was named vice-chairman, and Arthur W. F. Green, sales metallurgist John Illingworth Steel Co., secretary-treasurer. The following executive committee was chosen: Norman C. Einwechter, president Einwechter & Wyeth, for two years; Dr. H. C. Boynton, metallurgist John A. Roebbing's Sons Co., Trenton, N. J., for two years; C. C. Willitts, district sales manager Central Alloy Steel Corporation, for one year; M. M. Kennedy, metallurgist Philadelphia Navy Yard, for one year, and J. R. Adams, superintendent of research and special problems for Midvale Co., for two years.

SILAS M. HAIGHT, recently engineer for the Highway Products & Mfg. Co., Elmira, N. Y., has been appointed manager of the research department of the Sweet's Steel Co., Williamsport, Pa. He was graduated in civil engineering from Lafayette College, Easton, Pa., in 1908 and has been engaged in varied engineering practice.

JOHN D. TINSMAN, formerly superintendent of maintenance at Steubenville, Ohio, for the Wheeling Steel Corporation, has been appointed to a

similar position for the Republic Iron & Steel Co., serving in the Youngstown district, excluding the Trumbull works.

J. W. CLIFF, for the last five years shop superintendent of the Merco Nordstrom Valve Co., San Francisco, has been appointed production manager of the MacGregor Valve Co., St. Louis. His past engineering experience includes service with the Power Accounting Co., the Hyatt Roller Bearing Co., the Wright-Martin Aircraft Co. and the Weston Electrical Instrument Co.

DOUGLAS E. PRICE, recently in the contracting department of the Koppers Construction Co., Pittsburgh, has been appointed contract manager for the American Tar Products Co.

JOHN F. WILSON, auditor at the South works, Illinois Steel Co., retired from active duty on July 1, after 55 years of continuous service. He started to work for the Joliet Iron & Steel Co., March 15, 1873, remaining with this company and its successor, which was finally taken over by the Illinois Steel Co. He went to the South works as local auditor in 1900 and was one of two employees at the South works who were awarded the Gary medal for 50 years or more of service. H. S. Sylvester succeeds Mr. Wilson.

J. FRED MOWAT has been appointed chief engineer of the Illinois Steel Co.'s Joliet plant. He was graduated from Cornell University in 1904 and shortly after going with the Illinois company he was made steam engineer. In 1914 he was made master mechanic of the blast furnaces and in 1918 appointed assistant chief engineer.

P. C. SPRAGUE, for ten years traffic manager of the M. A. Hanna Co., Cleveland, has been appointed sales manager of the bituminous coal department of that company.

R. E. J. SUMMERS, chief contracting engineer of the H. K. Ferguson Co., Cleveland, engineer and builder, has been made a vice-president of that company in charge of contract work.

Orders received by the General Electric Co. for the three months ended June 30 amounted to \$90,431,957, compared with \$78,105,247 for the corresponding quarter of 1927, an increase of 16 per cent. President Gerard Swope has announced. For the six months ended June 30, orders received amounted to \$170,357,797, compared with \$155,655,828 last year, an increase of 9 per cent.

Sheffield Steel Corporation has given an order to Westinghouse Electric & Mfg. Co. for electrical equipment for a steel mill to be built in Kansas City with monthly capacity of 10,000 tons.

British Trade Is Unsatisfactory

Some Lighter Lines Doing Fairly Well, but Heavier Steel Products and Pig Iron Are in Slow Demand

LONDON, ENGLAND, July 6.—The position of the iron and steel trade generally continues very unsatisfactory. This is particularly true of the pig iron industry and of the heavy steel branches, there being a fair amount of activity in a number of the lighter lines.

In pig iron, the chief weakness lies in large stocks and poor demand, and although the production in various parts of the country has been subjected to drastic curtailment, Cleveland producers of pig iron are perhaps better off than those in other districts, as their stocks are small; they are busy on current contracts and their selling prices are governed by their own "ring," but they, too, are beginning to feel the necessity of looking for new business to replace the old. The whole iron and steel market is under the influence of holidays. Last week Tyne-side was on vacation. Next week the Glasgow Fair begins, to be followed later by the Black Country wakes and Stockton race week, so that August will be over before there can be any return to normal conditions.

In the steel trade, the heavy industries are in the worst plight. A few more ships are coming on the stocks, but the tonnage of steel therefrom is but a drop in the ocean. Steel makers have made repeated efforts to obtain government assistance, but without

success, and the trade must be left to work out its own salvation. Drastic reduction in costs and revisions in methods of disposal, etc., are needed; that is why there has been so much talk of a central selling agency, but the most favorably placed works, both economically and geographically, are not disposed to assist their less fortunate competitors, so that for the time being there is little prospect of such a plan being consummated.

Export buying of heavy materials is at low ebb. The closing of the Tata Iron & Steel Co.'s works in India, because of labor disturbances, has released a few orders for this country, and Japan is trying to place some contracts here, while locomotive builders have some useful South African contracts to execute; but apart from these the demand for export is exceptionally meager. In the home branches, engineering and construction departments keep some plants busy.

Trading in tin plate has continued good, although the confidence of consumers has been shaken by the fall in tin prices during the last month or two, but makers are very busy and the operations at the mills are running at well over 90 per cent, and some plants are assured of full capacity working for a number of weeks or months.

Orders for Fabricated Structural Steel Fall Off

WASHINGTON, July 17.—Tonnage of new orders reported by the principal manufacturers of fabricated structural steel for June are given by the Department of Commerce as 233,775 tons, representing 81 per cent of capacity. This is the total from 196 firms whose capacity is given at 289,430 tons. It compares with orders in May aggregating 251,488 tons, or 83 per cent of the 304,950 tons capacity of the 223 firms then reporting.

Computed tonnage in June is given as 303,750 tons, a reduction of about 2½ per cent from the 311,250 tons for May. Except for May and for July, 1927, however, this computed tonnage is the largest for several years. In July, last year, it was 345,000 tons, while in June it was 228,750 tons.

Shipments of the 229 identical firms carried in the computed tonnage lists were given as 270,000 tons in June, representing 72 per cent of capacity. This is the largest total since last September, when the same figure was reported. In August, last year, the total was 285,000 tons. That is the only case exceeding last month's total in several years.

For the half year, computed tonnage of new orders is given as 1,586,250, against 1,395,000 a year ago. This represents an increase of about 14 per cent. Similarly, shipments in the six months are computed at 1,455,500 tons this year against 1,342,500 tons last year, representing a gain of about 8½ per cent.

Standard Sample of Fluorspar

The Bureau of Standards at Washington has prepared a standard analyzed sample of fluorspar, which contains 94.9 per cent calcium fluoride, 1.9 per cent silica, 1.0 per cent carbon dioxide, 0.14 per cent sulphur, 0.34 per cent zinc and 0.25 per cent lead.

The price of this sample, which is No. 79 in the series, is \$2.50 for 60 grams. The sample may be paid for in advance with the order or be sent parcel post C.O.D. in the United States and its possessions. A complete list of standard samples and analyses is given in Bureau of Standards supplement to circular No. 25, which can be obtained upon application to the bureau.

OBITUARY

RUFUS C. PHILLIPS, secretary American Rolling Mill Co., Middletown, Ohio, and a brother-in-law of George M. Verity, president of that company, died in a hospital at that city on July 11, aged 63 years. He was born at Georgetown, Ohio, and early in life became acquainted with Mr. Verity, joining him in 1891 in the

RUFUS C. PHILLIPS

organization of a steel company in Cincinnati which developed into the present Rolling Mill Co. At that time he was placed in charge of the sales department, continuing in that work until illness forced him to withdraw from active interest. He was prominent in civic, educational and religious affairs at Middletown, having been the founder of the Y. M. C. A. in that city.

CHARLES A. CHEVRAUX, secretary and general manager of the Massillon Rivet & Mfg. Co., Massillon, Ohio, successor to the Canton Bolt Co., died on July 6, as a result of injuries sustained a few days before while inspecting machinery at the company's plant. He was born at Canton, Ohio, 51 years ago and was secretary of the Cleveland-Canton Spring Co. for 24 years. He then went to Richmond, Ind., as production manager of the Jenkins Vulcan Spring Co., but returned to Ohio as secretary of the Beans Spring Co., Massillon.

MAJ. JOSEPH A. STEINMETZ, founder and senior member of Janney, Steinmetz & Co., Philadelphia, died at his home in that city on July 11, aged 58 years. He attended Lehigh University, Bethlehem, Pa., and soon afterward became associated with Professor Langley in the development of airplane engines. Since that time he had been constantly active in

aviation work, particularly during the World War, when he was the inventor of many anti-aircraft devices. Mr. Steinmetz had been active in Janney, Steinmetz & Co. until his partial retirement six months ago on account of ill health. He was a member of the American Society of Automotive Engineers, the Franklin Institute, the American Electrochemical Society and the Engineers Club of Philadelphia.

ALEXANDER R. PEACOCK, one of the partners of Andrew Carnegie in the Carnegie Steel Co., Ltd., and, prior to the formation of the United States Steel Corporation, first vice-president and general sales manager of the Carnegie company, died on July 12 at St. Vincent's Hospital, New York, aged 66 years. Mr. Peacock and Mr. Carnegie were born in the same town, Dunfermline, Scotland, and the former began his career in the United States in the linen department of a Pittsburgh department store, where his work came to Mr. Carnegie's attention. He entered the credit department of the Homestead works of the Carnegie company but later was transferred to the sales department, subsequently becoming general sales agent. At the time of the changes in the management of the Carnegie Steel Co., Ltd., attending the election of Charles M. Schwab as president, April 1, 1897, Mr. Peacock was made first vice-president and placed in general charge of the selling department. He continued in this position after the reorganization of the company at the time of the Frick-Carnegie suit in 1899. At that time the official records showed that he was the holder of 2653 shares of stock and of \$2,707,000 in bonds of the new company. He retired from active participation in the steel industry at the formation of the Steel Corporation and had resided in recent years at the Hotel Broztell in New York.

FREDERICK WINTERS GRIFFITH, one of the founders and president, treasurer and a director of the Garlock Packing Co., Palmyra, N. Y., died July 11, at his home in Pasadena, Cal. He was born at Phelps, N. Y., in 1858, and was graduated from Hamilton College. His entire business career had been spent in the mechanical packing industry.

MICHAEL J. GOOLEY, senior member of Gooley & Edlund, Inc., Cortland, N. Y., manufacturer of jigs, fixtures and other machine shop products, was killed in an automobile accident near his home in Syracuse, N. Y., on July 14. He was 63 years of age and had been prominent in manufacturing circles of Syracuse and Cortland.

FRANK H. HAYES, president Hayes Pump & Machinery Co., Cambridge, Mass., died July 14 at the Cambridge Hospital. He was 79 years old and had been in the pump and machinery business 45 years, first with the Dean Steam Pump Co. He organized his own company in 1900.

THOMAS F. FLINN, engineer, for 37 years identified with Henry R. Worthington, now the Worthington Pump & Machinery Corporation, died July 9 at his home in Brooklyn, aged 87 years. He was born in Ireland and

THOMAS F. FLINN

came to this country just prior to the outbreak of the Civil War, in which he served, rising to the rank of lieutenant in the Union Army. In later years he had been interested in the development of motor cars, his experiments having resulted in the invention of a steam engine for automobile use. At the outbreak of the World War he offered his services to the Government and did experimental work in the development of aviation motors. He was a life member in the American Society of Mechanical Engineers.

EMIL EISELT, works manager for the Standard Steel Car Co., Hammond, Ind., died July 12 of pneumonia, aged 47 years.

JUSTIN D. CROSBY, head of the J. D. Crosby Co., Pawtucket, R. I., maker of cold rolled steel, died July 11 at the Memorial Hospital in that city, of pneumonia. He was born at Worcester, Mass., 66 years ago, where he was employed by the Washburn Woven Wire Co. and the American Steel & Wire Co. He established his Pawtucket business in 1910.

WILLIAM PESTELL, vice-president of the Riley Stoker Corporation, Worcester, Mass., died on July 10. He was born at Rutland, England, 56 years ago. He became a member of the Riley organization in 1914 and in recent years was manager of sales.

Machinery Markets and News of the Works

Slight Falling Off in Orders

Sizable Sales Include 11 Tools for Commonwealth Edison Co.—List of Tools for Hammond, Ind., Power Plant Expected

DEMAND for machine tools was slightly less during the past seven days than the average over the five or six preceding weeks. However, allowing for the season, the volume of orders is good, and is considerably higher than in the corresponding period last year. In the Cincinnati district operations are being well sustained, although the capacity of some machine tool plants is much more fully engaged than that of others. Fresh inquiry from scattered sources is of fair total.

The General Electric Co. and the Wright Aeronautical Corporation continue in the market and orders are still being received from agricultural implement makers. Except for the placing of an order for eight production lathes, demand from the Detroit territory has been quiet. Fresh inquiries from railroads in the Chicago district show more promise than for some time.

A list of tools is being prepared by the State Line Generating Co., Hammond, Ind., for a new power plant. Boston will close bids July 19 on six machine tools for the Hyde Park district school and it is expected that at least part of the first list for the same school will be closed within a week. Four large machines, including a $\frac{5}{8}$ x 102-in. gate shear, are to be ordered by A. M. Castle & Co., Chicago, for their San Francisco warehouse.

Sizable sales include 11 machine tools for the Fisk Street station of the Commonwealth Edison Co., Chicago. The Bethlehem Steel Co. purchased two large turret lathes and may buy a few other tools. A dealer in the Chicago district received orders for 11 power presses of small and medium size during the past week.

New York

NEW YORK, July 17.—Machine tool business in the first half of July ran considerably ahead of that in the corresponding period last year, but was slightly less than last month's average sales. Those who have participated in orders being distributed by the General Electric Co. and the Wright Aeronautical Corporation—and these orders are coming in every day—have fared somewhat better than is usually to be expected at this season of the year. Inquiries are in fairly good number, and machine tool sellers have plenty of prospects upon which to work, but vacation absences of executives of manufacturing companies tend in some cases to delay purchases. The Bethlehem Steel Co. recently purchased two large turret lathes and may buy a few other tools.

Sales by Niles-Bement-Pond Co. in the week included a 72-in. duplex-controlled horizontal boring machine, 27-in. Time-Saver lathe, 20-in. Niles-Acme shaper and a number of other tools. Pratt & Whitney

division sold four 5-in. production hand milling machines, three No. 2 jig borers, three 14-in. vertical surface grinders and two Sigourney drilling machines.

Bids will be asked within 60 days by Western Electric Co., 195 Broadway, New York, for a new five-story plant at Emeryville, Cal., to cost close to \$500,000 with machinery. Engineering department of company is in charge. Pacific Coast offices are at 680 Folsom Street, San Francisco.

George A. Bagge & Sons, 157 East Forty-fourth Street, New York, architects, have asked bids on general contract for a two-story automobile service, repair and garage building to cost \$150,000 with equipment.

American Radiator Co., 40 West Fortieth Street, New York, has purchased property at Radburn, a new industrial site near Paterson, N. J., and plans construction of factory branch and distributing plant to cost close to \$100,000 with equipment.

Consolidated Copper Mines Corporation, 120 Broadway, New York, has approved plans for additional buildings at

properties in Middle West, including one-story machine shop, steel head frame, hoist house, as well as steel storage bins with capacity of 5000 tons, and other expansion, to cost more than \$90,000. J. B. Haffner is general manager.

Ovens, power equipment, conveying and other machinery and apparatus will be installed in two-story plant to be erected by Dugan Brothers, Inc., 288 South Fifth Street, Brooklyn, at Queensville, N. Y., to cost upward of \$350,000 with equipment. Henry Holder, 242 Franklin Avenue, is architect.

Beacon Oil Co., Inc., 320 Freeman Street, Brooklyn, has plans for new oil storage and distributing plant to cost close to \$150,000, for which bids will be asked on general contract in about a month. Headquarters are at Everett, Mass. B. F. Fallon, 26 Auckland Street, Boston, is architect.

Shampan & Shampan, 188 Montague Street, Brooklyn, architects, have taken out a permit for a two-story automobile service, repair and garage building, 100 x 278 ft., to cost close to \$180,000 with equipment.

Yale Electric Corporation, 60 Tillary Street, Brooklyn, manufacturer of flashlights, flashlight batteries and kindred products, has completed erection of new plant at Jersey City, six-stories, totaling 40,000 sq. ft. floor space, and will concentrate production at this point in the future, discontinuing operations at Brooklyn works, which is being removed to the new location.

American Can Co., 120 Broadway, New York, is said to have plans for a new seven-story plant unit, 100 x 200 ft., at Jersey City, N. J., to cost close to \$300,000 with equipment. A. B. Heiser is company architect.

Charles Freshman Co., 240 West Fortieth Street, New York, manufacturer of radio equipment, has disposed of additional stock, totaling about \$1,000,000, and will use a portion of fund in developing increased output for all-electric radio equipment and sets. Factory is at 470 East 133rd Street.

Board of Trustees, Pratt Institute, 257 Ryerson Street, Brooklyn, has awarded general contract to Edward Corning Co., 145 East Forty-fifth Street, New York, for a four-story mechanical and technology building, 60 x 180 ft., to cost about \$200,000 with equipment. John M. Howells, 156 East Forty-sixth Street, New York, is architect.

Rainbow Light, Inc., Thirteenth Street, Long Island City, operating subsidiary of Rainbow Luminous Products, Inc., same address, manufacturer of electric tube lighting equipment and devices, is planning an expansion program at branch

The Crane Market

LITTLE new business has been placed, but the trade is still actively interested in pending business, both domestic and export. Considerable crane equipment is expected to be needed for a power plant at Deepwater, N. J., on which Stevens & Wood, Inc., New York, is engineer. McClellan & Junkersfeld, New York, are asking for bids on a 100-ton electric overhead crane for a power plant in California and early action is expected on a 60-ton overhead crane for a power house of the Phoenix Utility Co., New York. The Pennsylvania Railroad is in the market for four 10-ton electric overhead cranes, two for Kearny, N. J., and two for Philadelphia.

In the Chicago district Sargent & Lundy, consulting engineers, Chicago, will purchase a 20-ton power house crane for delivery at San Benita, Tex. A. M. Castle & Co., Chicago, are also in

the market for two electric traveling cranes for their San Francisco plant, one of 5 and one of 10 tons' capacity.

Among recent purchases are:

W. R. Grace & Co., New York, one 5 and one 15-ton hand power crane with 28 ft. 8 in. span, for export to Peru, from Box Crane & Hoist Corporation.

Dollar Bay Steel Co., Dollar Bay, Mich., 22-ton, 8-wheel steam operated locomotive crane, from Orton Crane & Shovel Co.

Link-Belt Co., Chicago, 5-ton, 3-motor electric crane, from Manning, Maxwell & Moore, Inc.

Missouri Pacific Railroad, 20-ton gantry crane for use at Wichita, Kan., from Whiting Corporation.

plant at Detroit, with installation of additional facilities for production of luminous tubes and kindred specialties.

John Waldron Co., 30 East Forty-second Street, New York, manufacturer of paper mill machinery, has awarded general contract to H. K. Ferguson Co., Cleveland, for one-story addition to plant at Highland Park, N. J., to cost about \$45,000 with equipment.

Board of Education, Roselle Park, N. J., is considering installation of manual training equipment in three-story and basement high school to cost \$480,000, for which bids are being asked on general contract. Fred A. Elsasser, Fall Building, Union, N. J., is architect. J. W. Graves is clerk.

Wickham Co., Church Street, Matawan, N. J., manufacturer of piano plates and other castings, is arranging for immediate removal of local plant to its branch works at Springfield, Ohio, where production will be concentrated. Matawan plant will be sold.

Board of City Commissioners, City Hall, Newark, will soon begin work on a new hangar, 120 x 120 ft., with repair and reconditioning shop, at municipal airport, Port Newark, to cost close to \$70,000 with equipment. City engineering department is in charge.

United Color & Pigment Co., Evergreen Avenue, Newark, will soon begin superstructure for a one-story and basement addition, 70 x 121 ft., for which general contract recently was let to Enstice Brothers, 111 Academy Street, to cost about \$40,000 with equipment.

Howard Buschman, Newark, has leased property at 49-51 East Bigelow Street, for a machine shop.

City Commission, Asbury Park, N. J., has authorized plans for a municipal incineration plant, cost not to exceed \$155,000, and will take bids soon.

Ensign-Reynolds, Inc., 408 East 111th Street, New York, has been formed to manufacture high pressure gas burners for industrial applications, inspirators, gas boosters and air blowers. Company has shop equipped and does not contemplate additional building or letting of manufacturing contracts.

W. L. Clayton, Inc., 901 Bergen Avenue, Jersey City, has been organized to manufacture heating specialties. Products are being manufactured by contract, but company will let additional contracts in near future.

Carrier Engineering Corporation, 750 Frelinghuysen Avenue, Newark, N. J., manufacturer of air conditioning, drying, processing and refrigerating equipment,

has purchased four-story factory and office building a 850 Frelinghuysen Avenue, formerly occupied by Edison Lamp Works Division, General Electric Co. Company will remove to new quarters before Aug. 1.

Allen Air Appliance Co., Inc., 452 Lexington Avenue, New York, has been organized to manufacture single and multi-stage centrifugal blowers and exhausters and portable and stationary vacuum sweeping systems of heavy-duty type. Company has taken over plant, including foundry, pattern and machine shop, formerly occupied by Northern New York Foundry & Machine Co., Glens Falls, N.Y. F. C. Allen, Jr., founder and former president of Allen & Billmyre Co., Inc., New York, is president.

Philadelphia

PHILADELPHIA, July 16.—Philadelphia Garage Co., Carlisle and Cherry Streets, Philadelphia, has acquired six-story building, 50 x 180 ft., on North Broad Street, formerly occupied by Cadillac Motor Car Co., and will remodel for a new service, repair and garage unit, to be operated in conjunction with present garage, which is directly in rear of acquired property. Work will cost upward of \$75,000.

Swain-Hickman Co., 3519 Lancaster Avenue, Philadelphia, manufacturer of automobile parts, has asked bids on general contract for an addition to cost more than \$23,000 with equipment.

William Steele & Sons Co., 219 North Broad Street, Philadelphia, engineer and contractor, has plans for a five-story automobile service, repair and garage building, 90 x 155 ft., with capacity of about 500 cars, to cost \$160,000.

Sun Oil Co., Finance Building, Philadelphia, is said to be planning early rebuilding of portion of storage and distributing plant at Syracuse, N. Y., recently destroyed by fire, with loss close to \$100,000 including equipment.

Victor Talking Machine Co., Camden, N. J., has acquired property at Hollywood, Cal., as site for new Pacific Coast plant for development and manufacture of talking machine apparatus in connection with motion pictures. A record-pressing unit will also be built. Entire project will cost about \$250,000 with equipment. E. R. Fenimore Johnson is executive vice-president.

Atlantic Refining Co., 260 South Broad Street, Philadelphia, is considering construction of a new oil refinery on Neches River at Atreco, Tex., where a loading

station is now being operated, to cost more than \$12,000,000. Project will be carried out in conjunction with new 10-in. pipe line to be built by Atlantic Pipe Line Co., a subsidiary, from Midland, Tex., to Atreco, about 500 miles, for which surveys will be made at once. It will be provided with 12 booster stations and have capacity of about 30,000 bbl. of crude oil per day.

George D. Ellis & Sons, Inc., 309 North Third Street, Philadelphia, manufacturer of tin cans and metal containers, has acquired three and four-story building, 69 x 97 ft., at 220-24 Wood Street, for expansion.

Marwick Non-Skid Chain Mfg. Co., Falls, Pa., recently formed by Fred Marwick and James Bailey, both of Falls, plans early operation of local plant for manufacture of tire chains.

Hajoca Corporation, 1136 Ridge Avenue, Philadelphia, manufacturer of plumbing equipment and supplies, has acquired former foundry of Hazleton Iron Works, Hazleton, Pa., and will use site for new factory branch and distributing plant. Existing building will be razed and two-story structure, 50 x 190 ft., erected.

Sandusky Cement Co., Engineers' Building, Cleveland, has purchased tract of 50 acres in Hellam Township, vicinity of Hellam, Pa., adjoining tract acquired several months ago, and is reported considering a branch mill and distributing plant in this section.

Wilmington Gas Co., Wilmington, Del., has plans for a new equipment storage and distributing plant, 102 x 182 ft., to include shops for repair of meters, gas appliances, etc., and machine and repair shop for motor trucks. Cost is estimated at close to \$80,000 with equipment.

Board of Education, Tyrone, Pa., plans installation of manual training equipment in new two-story junior and senior high school to cost \$160,000, for which bids will soon be asked on general contract. Lawrie, Green & Co., Third and Forster Streets, Harrisburg, Pa., are architects.

Ornamental Iron Works, Mount Carmel, Pa., recently organized by R. J. Best and L. W. Brandlinger, both of Mount Carmel, has awarded general contract to Truscon Co., Youngstown, for a one-story plant to cost close to \$27,000 with equipment.

Horace T. Potts & Co., Philadelphia, have been appointed sales agents in eastern Pennsylvania, southern New Jersey and Delaware for patent non-splitting nail manufactured by Stronach Nail Co., Pittsburgh.

New England

BOSTON, July 16.—The city of Boston will close bids July 19 on an automatic screw machine, three milling machines, a shaper and a surface grinder. This completes the equipment wanted for the Hyde Park district school. It is expected that at least a part of the first-list on which bids were submitted will be closed within a week. Aside from this business the local machine tool market is inactive. There is also a noticeable lack of new inquiries. Dealers have a large number of what are considered active prospects, but there is little indication of their closing within the immediate future. Small tools continue in good demand with deferred deliveries on certain makes.

Griffin Wheel Co., 40 Gerrish Avenue, Chelsea, Mass., is making plans for new crane runways.

Androscoggin Foundry, 37 Washington Street, Auburn, Me., is building an addition. L. MacFadden is superintendent. Plans are private.

Funk & Wilcox, 26 Pemberton Square, Boston, architects, have completed plans for a one-story, 100 x 150 ft. ice-making plant for Ice Utilities, Inc., Lowell Street, Fall River, Mass.

C. T. Ashley, mayor, New Bedford, Mass., has awarded a general contract for a city vocational school to contain a machine shop. C. Hammond & Co., 179 North Water Street, New Bedford, are architects.

Plans are nearing completion for a two-story addition, 33 x 40 ft., for Beaudette Mfg. Co., Crescent Avenue, Chelsea, Mass., maker of loud speakers and other radio equipment.

Robertson Motor Co., School Street, Taunton, Mass., is considering a new one-story service, repair and garage building at Hyannis, Mass., to cost upward of \$75,000 with equipment.

LeBoeuf Fountain Pen Co., Inc., Springfield, Mass., has leased space in building at 4 Birnie Avenue, formerly occupied by Perkins Machine & Gear Co., totaling 5700 sq. ft., for new plant for production of desk sets, fountain pens and kindred products. Present works at 33 and 49 Arch Street will be removed to new location early in August.

Board of Education, 169 Church Street, New Haven, Conn., has authorized installation of metal-working, and other vocational shops in three-story addition to be erected at Fair Haven junior high school, for which bids are being asked on general contract until July 26. Brown & VonBeren, New Haven, are architects.

Automotive Standards, Inc., Newark, N. J., which recently established local plant for manufacture of automobile equipment on waterfront site and with main offices at 60 Park Place, Newark, has purchased Hartford Battery Mfg. Co., Hartford, Conn., and will operate as a unit of its business.

Winsted Insulated Wire Co., Winsted, Conn., will install considerable additional machinery for increased output.

Compressed Steel Shafting Co., 1587 Hyde Park Avenue, Hyde Park, Boston, has awarded general contract to Topham & Bates, 1209 Hyde Park Avenue, for a one-story addition, to cost more than \$30,000 with equipment.

City Water Department, Springfield, Mass., E. Lochridge, chief engineer, is completing plans for new power house on site of reservoir, Little River, with capacity of 23,000 kw., to cost about \$1,000,-

000. Station will be leased to Turners Falls Power & Electric Co., Turners Falls, Mass., which will build a transmission line for connection with its system.

Horton Mfg. Co., Bristol, Conn., manufacturer steel fishing rods and other fishing tackle, has awarded general contract to Torrington Building Co., Torrington, Conn., for an addition.

Plant and equipment of Stanford Steel Corporation, Buckingham Avenue, Milford, Conn., will be sold at public auction July 23. Property consists of one-story brick and steel manufacturing building containing 12,000 sq. ft. of floor space and other frame buildings with miscellaneous equipment. James B. Kelly Co., 42 Church Street, New Haven, Conn., is auctioneer.

Cincinnati

CINCINNATI, July 16.—Machine tool orders have fallen off slightly the past week, although the volume for the first half of July mounted to a surprisingly satisfactory level. Despite the summer season, operations in local shops are being well sustained and business on hand is sufficient to insure the continuation of production on the current scale for several weeks. The situation is somewhat spotty, however, some plants getting a proportionately large share of the business and others badly in need of orders, but the general average is good for this time of year.

An automobile company has bought eight high production lathes, but aside from this single transaction, purchases in the Detroit district have been meager. Local builders have continued to receive orders from agricultural implement makers. A sale of two engine lathes to a company in Russia is noted. The Southern Pacific has contracted for a 4000-lb. double frame steam hammer and the Manistee Iron Works, Manistee, Mich., has bought a 72-in. duplex control borer.

Board of Education, Oxford, Ohio is considering installation of manual training equipment in new junior and senior high school to cost about \$165,000, for which plans will be drawn by Ronen & Ingleson, 1614 North High Street, Columbus, Ohio, architects.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until July 23 for ammeters, voltmeters, etc., circular 35.

A substantial interest in Cincinnati Bell Crank Co., North Oakley, Cincinnati, manufacturer of automobile parts and equipment, has been acquired by Ludwig Kemper, 2996 Brighton Road, Cleveland, connected with local steel companies, and associates. Plans are under way for reorganization of company with expansion program.

Board of Putnam County Commissioners, Cookeville, Tenn., is planning extensions and improvements in hydroelectric power plant at Burgess Falls, to cost \$100,000 with equipment. Special election has been called Aug. 4 to approve bonds.

Four Hundred Seventy-Six Tire Co., 114 North St. Clair Street, Dayton, Ohio, is having plans drawn for a two-story service and repair works, 50 x 100 ft., to cost close to \$65,000 with equipment.

Radnor Water Co., Inc., Nashville, Tenn., plans installation of pumping machinery and other power equipment in waterworks station for service in Rad-

nor Heights and Flat Rock sections, to cost about \$200,000.

Portsmouth Auto Parts & Wrecking Co., 1121 Findlay Street, Portsmouth, Ohio, has plans for new one-story factory, 35 x 80 ft., to cost close to \$37,000 with equipment. Bids will soon be asked on general contract.

Stoll Oil Refining Co., Louisville, is planning an addition to oil storage and distributing plant at Elizabethtown, Ky., to cost more than \$45,000 with equipment. W. A. Stoll is treasurer.

Board of Education, Bowling Green, Ky., is considering installation of manual training equipment in a new junior high school to cost more than \$200,000, for which plans will be drawn by Marr & Holman, Nashville, Tenn., architects.

Board of Education, Newark, Ohio, will take bids at once on general contract for new two-story Roosevelt junior high school, to cost about \$225,000 with manual training facilities. Vernon Reading and Associates, Walpark Building, Mansfield, Ohio, are architects.

Chicago Pneumatic Tool Co., New York, announces appointment of W. S. Lynch, formerly district manager at Seattle, as district manager of Cincinnati office. Mr. Lynch succeeds T. G. Smallwood, who has been granted an indefinite leave of absence because of ill health.

St. Louis

ST. LOUIS, July 16.—Plans are being arranged by St. Louis Public Service Co., Park Avenue and Thirty-ninth Street, St. Louis, for remodeling portion of car barn for a general repair shop, with wash house unit, to cost about \$75,000.

Market Development Corporation, International Life Building, St. Louis, is planning new cold storage and refrigerating plant, to cost in excess of \$100,000 with equipment. Henschien & McLaren, 1637 Prairie Avenue, Chicago, are architects and engineers.

Universal Cutter Co., 4567 Scott Avenue, St. Louis, has taken bids on general contract for new two-story and basement plant, 55 x 115 ft., L-shape, to cost approximately \$60,000 with equipment. Alfred H. Norris, 11 Dartford Place, Clayton, Mo., is architect.

L. J. Kent Boiler & Sheet Iron Works, 700 East Brower Street, Springfield, Mo., will soon begin work on new one-story plant, to cost about \$30,000 with equipment.

Tonkawa Petroleum Co., Tonkawa, Okla., and Globe Refining Co., Blackwell, Okla., lessee, are said to be planning to rebuild portion of oil refinery at Tonkawa, destroyed by fire July 4, with loss in excess of \$85,000 including equipment.

Meeker Advertising Co., Third and Michigan Streets, Joplin, Mo., manufacturer of advertising novelties, signs, etc., is said to be arranging early call for bids for new two-story plant, to cost close to \$100,000 with equipment. Smith & Van Pelt, National Bank Building, Joplin, are architects. Lockwood, Greene & Co., 400 North Michigan Avenue, Chicago, are engineers.

City Council, Kansas City, Mo., is planning establishment of municipal airport, with hangars, repair and reconditioning shops, oil storage and distributing buildings, etc., to cost about \$1,000,000 with land. City has called special election Aug. 7 to approve bond issue in amount noted. At same time a bond issue of \$3,000,000 will be voted upon, fund to be used for expansion and betterments.

Layton, Hicks & Forsyth, Braniff Building, Oklahoma City, Okla., architects, have plans for six-story automobile service, repair and garage building, 100 x 100 ft., to cost in excess of \$175,000 including equipment.

Missouri-Kansas Pipe Line Co., Kansas City, Mo., is disposing of bond issue of \$1,500,000, a portion of proceeds to be used for extensions and improvements in pipe lines for natural gas supply, compressor stations, and other operating facilities. Frank P. Parish is president.

Union Pacific Railroad Co., Union Pacific Building, Omaha, Neb., has received low bid from Thomas J. Allen, Scottsbluff, Neb., and will begin work soon, including engine house, one-story machine shop, 27 x 75 ft., oil pumping station, boiler house, 85-ft. turntable, and other units. Entire project is estimated to cost more than \$150,000 with equipment. H. C. Mann is chief engineer.

Weinberg & Weinberg Realty Co., 809 Chestnut Street, St. Louis, is at head of project to build ten-story automobile service, repair and garage building, to cost approximately \$500,000 with equipment.

Cushing Refining & Gasoline Co., Cushing, Okla., is planning construction of two new gasoline refineries in St. Louis-Pearson district, to cost upward of \$100,000 with equipment.

Contract for a 5000-bbl. per pipe still for Okmulgee refinery of Independent Oil & Gas Co. has been awarded to Graver Corporation, East Chicago, Ind.

Paxton Mitchell Co., Omaha, Neb., will build a new foundry, 93 x 160 ft.

City Council, Kirksville, Mo., is considering erection of a municipal electric light plant.

Chicago

CHICAGO, July 16.—Sales of machine tools from miscellaneous sources are holding up well though indications are that July will not be as active as June. Fresh inquiry is coming from scattered sources and the bulk of requests for prices appears to be active. The Commonwealth Edison Co., Chicago, has purchased 11 tools, including one 36-in. lathe for its Fisk Street station. Users of small and medium sized presses are active buyers, one dealer having sold 11 of these machines in the past seven days.

New inquiries from the railroads show more promise than at any time since the closing of the Santa Fe list. The Chicago, Burlington & Quincy will buy an eye bolt machine. The Chicago & North Western is still inquiring for the tools mentioned last week. The Chicago, Rock Island & Pacific will take prices on a hydraulic sectional flanging press, a vertical spindle grinder, a swing frame wood saw and a 6-in. pipe and nipple threading machine. A. M. Castle & Co., Chicago, will buy for its San Francisco warehouse a 5/8-in. x 102-in. gate shear, a high-speed structural material cutting saw, a bulldozer and an angle bar and universal plate shear. A meter manufacturer in Illinois has purchased a 20-in. lathe, and a motor parts manufacturer in Indiana has closed for a 16-in. lathe.

Consolidation of seven manufacturers of dairy machinery and supplies to form Cherry-Burrell Corporation, with assets of approximately \$8,000,000, is indicated in announcement that directors have approved the merger. Companies which will be consolidated are J. G. Cherry Co., Cedar Rapids, Iowa; D. H. Burrell & Co.,

Little Falls, N. Y.; Milwaukee Dairy Supply Mfg. Co., Milwaukee; John W. Ladd Co., Detroit; Cherry-Bassett Co., Baltimore; Wright-Zeigler Co., Boston, and A. H. Barber-Goodhue Co., Chicago.

David Lupton's Sons Co., Philadelphia, manufacturer of steel windows, has purchased 6 1/2-acre tract in Clearing industrial district, Chicago, for erection of a manufacturing plant. Initial building will be 150 x 500 ft. with plans for ultimate expansion to 300 x 1000 ft.

Crown Rheostat & Supply Co., 1908 Maypole Avenue, Chicago, has awarded contract for an addition, 40 x 46 ft.

Tri-City Steel & Supply Co., Rock Island, Ill., has been capitalized at \$40,000 and will distribute steel products from its warehouse at 2123 Third Avenue.

H. Channon Co., Chicago, dealer in mill supplies, has purchased Machinists Supply Co., Chicago.

Bids have been asked on general contract by Anetsberger Brothers, machinists, 2725 Lincoln Avenue, Chicago, for new two-story machine shop, to cost about \$35,000 with equipment. B. J. Bruns, 1851 Irving Park Boulevard, is architect.

Mokrum-Kleinschmidt Corporation, Southport and Wrightwood Avenues, Chicago, manufacturer of automatic telegraphic machinery and parts, has acquired adjoining property for expansion. Plans for new unit will be drawn later.

Board of Education, Virginia, Minn., plans installation of manual training equipment in a new two-story senior high school to cost \$500,000, for which bids are being asked on general contract until July 24. J. A. Coddington, National Bank Building, is architect.

Waterworks Department, City Hall, Minneapolis, Minn., J. A. Jensen, supervisor, has plans for one-story equipment storage and repair plant, with department for repair of water meters, to cost \$38,000 with equipment.

Terminal Grain Corporation, Grain Exchange Building, Sioux City, Iowa, will take bids for an addition to grain elevator to cost approximately \$100,000 with elevating, conveying, screening and other equipment. Horner & Wyatt, Board of Trade Building, Kansas City, Mo., are consulting engineers.

Martin Machine Works, 228 Laflin Street, Chicago, has awarded general contract to Chicago Industrial Construction Co., 53 West Jackson Boulevard, for one-story machine shop, 48 x 125 ft., with foundations to provide for second story later, to cost close to \$30,000 with equipment.

Board of Education, Brainerd, Minn., is considering installation of manual training equipment in new three-story senior high school to cost \$425,000, for which plans will soon be completed by Croft & Boerner, 1004 Marquette Avenue, Minneapolis, Minn., architects.

City Council, Chicago, has authorized plans drawn by Department of Public Works for an island airport, near Grant Park, to include hangars, repair and reconditioning shops, oil storage and distributing buildings, pumping station and other units, with complete facilities for night flying. A fund of \$5,000,000 will be arranged for project.

Altorfer Brothers Co., Peoria, Ill., manufacturer of mechanical washing equipment, is said to have plans for a one-story addition, to cost upward of \$40,000 with equipment. H. E. Todd is president.

Kewanee Boiler Corporation, Kewanee, Ill., will soon begin work on one-story unit, 80 x 280 ft., to cost close to \$150,000 with equipment.

Kelly Mfg. Co., Clinton, Iowa, manufacturer of furniture, has awarded general contract to William L. Yokum, 730 Main Street, Dubuque, Iowa, for a new three-story factory, 85 x 150 ft., to cost approximately \$80,000 with equipment. A. H. Morrell, Clinton, is architect.

Tract of 32 acres at East Chicago, Ind., has been purchased by United States Gypsum Co., 300 West Adams Street, Chicago, as site for new plant for production of rock wallboard, gypsum blocks, plasters, etc., to cost more than \$500,000 with machinery.

Detroit

DETROIT, July 16.—Michigan Boiler & Sheet Metal Works, 4120 West Jefferson Avenue, Detroit, is planning a one-story addition, to cost close to \$40,000 with equipment.

Consumers Power Co., Jackson, Mich., is planning new power substation at Saginaw, Mich., with capacity of 12,000 kva., to cost close to \$200,000 with equipment; later, output will be increased to 30,000 kva. at additional cost of approximately \$250,000.

Alloy Steel Spring & Axle Co., Jackson, Mich., has purchased National Plating & Enameling Co., with local plant, and will operate as a unit of its business. Purchasing company has arranged for a stock issue to total \$562,500, a portion of fund to be used for acquisition and for expansion in output.

Typographical error was made in this column last week in referring to Gorham Tool Co., 2206 Twelfth Street, Detroit, as Forham Tool Co. Bids will be asked this month for two-story addition on Woodrow Wilson Avenue, to cost about \$65,000. Lane, Davenport & Peterson, Charlevoix Building, are architects. L. C. Gorham is president.

Autorad Electric Corporation, Adrian, Mich., recently organized to manufacture radio equipment and parts, has leased space in local plant of Evans-Miller Cedar Products Co., and will install equipment at once.

Murray Corporation of America, Inc., Russell Street and Clay Avenue, Detroit, manufacturer of automobile bodies, plans early erection of new one-story plant, to cost about \$80,000 with equipment.

Airport Committee, Bay City, Mich., is arranging for purchase of tract of 175 acres of waterfront property as site for a municipal airport, and will soon begin construction of hangars, repair shops, oil storage and distributing buildings and other units. C. J. Gregory is member of committee.

Wayne County Board of Supervisors, Penobscot Building, Detroit, E. G. Ewald, chairman, has surveys under way for a new airport near city limits, for which a fund of about \$2,000,000 will be arranged, to include hangars, repair and construction shops, pumping station, oil storage and distributing buildings and other units.

Fruehoff Trailer Co., 10940 Harper Avenue, Detroit, has awarded general contract to E. Buchman, 3921 Moran Road, for a one-story assembling unit to cost about \$65,000 with equipment. H. P. Stihler, 2931 Gray Avenue, is architect.

Detroit Piston Pin & Mfg. Co., Grand Haven, Mich., maker of piston pins and other automotive parts, has changed name to Ottawa Steel Products Co., Inc.

Central Specialty Co., Detroit, manufacturer of automotive castings and plumbing fixtures, has merged with

Ypsilanti Foundry Co., Ypsilanti, Mich., maker of automobile parts. New company will be known as Central Specialty Co. and will have total assets of approximately \$750,000. Considerable equipment in Detroit plant will be moved to Ypsilanti and new equipment will be purchased for both plants.

Contract for erection of new \$2,500,000 press room addition to plant of Fisher Body Corporation, Pontiac, has been awarded to W. E. Wood & Co., Detroit.

Packard Motor Car Co., Detroit, has awarded to Everett Winters Co. general contract for an aluminum foundry to cost \$100,000.

Gulf States

BIRMINGHAM, July 16.—Work will be started by Nitrate Corporation of America, Inc., Marfa, Tex., A. A. Snell, general manager, recently organized with capital of \$500,000, on new plant for production of nitrate soda and potash. Company has tract of about 6000 acres and will install crushing and mining equipment for handling 500 tons of material daily. It is purposed to construct an electric power plant at properties at later date. A housing development will be carried out for plant operatives. Initial project is estimated to cost more than \$175,000.

Board of Education, Beaumont, Tex., has authorized purchase of 22 acres in Oaks section, western part of city, as site for new high school with manual training department, for which a fund of \$900,000 has been arranged. Bids will be asked on general contract soon.

Reed Roller Bit Co., Mack Avenue, Houston, Tex., manufacturer of oil well equipment, etc., has filed plans for one-story machine shop to cost close to \$30,000 with equipment.

Warren, Knight & Davis, Empire Building, Birmingham, architects, have plans for one-story automobile service, repair and garage building, 75 x 140 ft., to cost close to \$80,000 with equipment.

International Paper Co., 100 East Forty-second Street, New York, is said to be completing plans for new kraft paper mill at Mobile, Ala., where Chamber of Commerce has secured a fund of \$100,000 to insure project. Plant will have capacity of 175 tons per day, and will include power house and machine shop. It is estimated to cost more than \$3,500,000 with machinery. R. J. Cullen, vice-president, is in charge.

A. & K. Auto Top & Paint Co., 2604-8 Main Street, East Dallas, Tex., is planning to rebuild its automobile body works destroyed by fire July 6, with loss close to \$50,000 including equipment. F. Walter Asmussen is plant manager.

St. Petersburg Cold Storage Co., Times Building, St. Petersburg, Fla., has plans for a new four-story cold storage and refrigerating plant, 100 x 125 ft., and for similar one-story unit, 50 x 100 ft., at Clearwater, Fla., to cost close to \$275,000 with equipment. C. C. Whitaker, Bona Allen Building, Atlanta, Ga., is engineer. Elliott B. Hadley is company architect.

Board of City Commissioners, S. E. Moss, water commissioner, City Hall, Dallas, Tex., is asking bids until Aug. 8 for equipment for \$4,000,000 expansion and improvement program for municipal waterworks, including central pumping plant and machinery, \$800,000; complete filtration plant and machinery, \$1,200,000; and water distributing facilities, \$2,000,000. Fuller & McClintock, 170

Broadway, New York, are consulting engineers. J. B. Winder is chief engineer of Dallas water department.

Gerald E. Melliff, 628 Buena Vista Street, San Antonio, Tex., and associates have plans for a three-story automobile service, repair and garage building, totaling about 26,000 sq. ft. floor space, to cost close to \$200,000 with equipment. Work will begin in August.

Airport Committee, Chamber of Commerce, Laurel, Miss., has acquired a tract of 150 acres near city limits for a municipal airport, and plans early construction of hangar, repair and reconditioning shop, oil storage and distributing building, and other mechanical units.

Sewerage and Water Board, 526 Carondelet Street, New Orleans, will receive bids until Sept. 6 for a 15,000-kw. turbo-generator, pumps and accessory equipment for drainage system.

Buffalo

BUFFALO, July 16.—Bids have been asked on general contract by Great Lakes Portland Cement Co., Marine Bank Building, Buffalo, for new four-story mill on Cuyahoga River, near Cleveland, to cost more than \$350,000 with equipment.

Northern New York Utilities, Inc., Watertown, N. Y., has approved plans for a new hydroelectric power plant on Beaver River, vicinity of Beaver Lake, with capacity of 12,000 hp., with transmission line to connect with present system, to cost in excess of \$400,000.

Field Force Pump Co., Elmira Heights, Elmira, N. Y., has plans for a new two-story factory, to cost approximately \$40,000 with equipment. Haskell & Considine, Hulett Building, Elmira, are architects.

Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, will establish an airport on 20-acre tract, just outside of city limits, and will use also as testing ground for airplane units manufactured at plant. Hangars, with mechanical and repair shops, and other buildings will be erected.

Herbert T. Dyett, Harry W. Barnard and other officials of Rome Wire Co., Rome, N. Y., have organized Atlantic Insulated Wire & Cable Co., an affiliated interest, with capital of 100 shares of stock, no par value, to manufacture wire and cables for electric service, and kindred products.

Department of Correction, Capitol Building, Albany, N. Y., is said to have plans for a new mechanical shop at State prison, Auburn, for which bids will be asked in fall.

Firestone Tire & Rubber Co., Akron, Ohio, has plans under way for one-story factory branch and distributing plant at Syracuse, N. Y., to cost more than \$75,000 with equipment.

Pittsburgh

PITTSBURGH, July 16.—Contract has been let by Standard Sanitary Mfg. Co., Bessemer Building, Pittsburgh, to V. L. Nicholson, 102 West Clinch Street, Knoxville, Tenn., for two-story and basement factory branch and distributing plant at Nashville, Tenn., 100 x 100 ft., to cost close to \$90,000. Marr & Holman, Stahlman Building, Knoxville, are architects.

Transcontinental Oil Co., Benedum Trees Building, Pittsburgh, operating refineries at Bristow and Boynton, Okla., and Fort Worth, Tex., with pipe lines, etc., is disposing of bond issue of \$12,000,000, a portion of proceeds to be used for expansion and improvements.

New Kanawha Power Co., Glen Ferris, W. Va., is planning a hydroelectric power development on New River, vicinity of Gauley Junction, W. Va., with two power dams and generating station, to cost more than \$400,000. Initial plant will have capacity of 75,000 hp. O. M. Jones, Glen Ferris, is engineer.

Pennsylvania Railroad Co., Pittsburgh, is said to be arranging for early electrification of its division from Rochester, Pa., to Baird, Ohio, about 60 miles.

Plant and property of Becker Steel Co., South Charleston, W. Va., have been acquired at a public sale by R. M. Venable, Charleston, W. Va., and associates, for a price of \$44,100. It is reported that a company will be organized to take over and operate plant.

Marvin Mfg. Co., Franklin, Pa., recently organized by George C. Miller and Grant Jones, both of Franklin, with capital of \$75,000, plans operation of local plant for oil compounding and lubricating oil production.

Boiler Tube Co. of America, Pittsburgh, has purchased assets of Johnson Peter Co., with plants at Pittsburgh and Brooklyn, distributor of Tyler lapweld steel, charcoal iron boiler tubes and seamless steel boiler tubes.

Milwaukee

MILWAUKEE, July 16.—Prospects for new business in the machine-tool trade are encouraging. The call for tools is holding up well, while inquiry is becoming more active as requirements for fall and winter production are being more or less settled. The dearth of industrial construction that has been noticeable in this locality is gradually being relieved, and the outlook is much brighter than it has been for a long time.

Milwaukee works of International Harvester Co., 784 Park Street, manufacturing tractors and cream separators, will be enlarged by erection of building No. 33, 108 x 301 ft., three stories. Plans have been completed by Worden-Allen Co., engineering department, 208 South La Salle Street, Chicago, which is taking bids until July 23. Work was started a short time ago on construction of a new power and heating plant at Milwaukee Harvester works, to cost about \$500,000.

American Metal Products Co., Thirty-fourth Avenue and Burnham Street, Milwaukee, has announced its intention of building a rolling mill this year. Work has just been completed on a foundry addition, 80 x 100 ft., doubling capacity. Company makes a wide variety of castings of a copper-aluminum alloy with a high iron content, for tools, bearings, bushings, packings, golf clubheads, etc. Carl J. Zaiser is president and general manager.

Geuder, Paeschke & Frey Co., 1500 St. Paul Avenue, Milwaukee, manufacturer of stamped and drawn ware, automobile mufflers, etc., will erect an addition affording 74,800 sq. ft. Building will cost \$90,000 without equipment.

Universal Foundry Co., Pine and Warren Streets, Oshkosh, Wis., has broken ground for a one-story addition, 55 x 100 ft., to cost \$30,000 equipped. General

contractors are Ben B. Gauthier & Co., local.

Esline Co., 610 Michigan Street, Milwaukee, manufacturer of sheet metal buildings, cottages, garages, etc., is considering sites in Milwaukee County manufacturing area with a view of erecting a complete new plant, it being impossible to expand its present factory further. Company is engaging in production of airplane hangars and plans to triple its present capacity. B. F. Eslien is president.

Minneapolis St. Paul & Sault Ste. Marie Railway has contracted with Peppard & Fulton, engineers, 217 Board of Trade Building, Superior, Wis., for rebuilding division roundhouse at Stevens Point, Wis., installing a new and larger turntable, and other improvements costing about \$75,000.

South Atlantic

BALTIMORE, July 16.—Plans have been approved by Central Foundry Co., Dundalk, Baltimore, for one-story addition, totaling about 40,000 sq. ft. floor space, to cost more than \$85,000 with equipment.

Continuing expansion program at local plant, Bethlehem Shipbuilding Corporation, Key Highway, Baltimore, has filed plans for another unit, for wood-working and metal-working service, to cost about \$100,000 with equipment.

Bids will be asked in August by United Railways Co., Continental Building, Baltimore, for one-story and basement motor bus service, repair and garage building, to cost close to \$200,000 with equipment. W. H. Emory, Jr., 18 East Lexington Street, is architect.

Old Dominion Power Co., St. Charles, Va., is said to be planning to rebuild portion of power plant in Pocket section, near St. Charles, recently destroyed by fire, with loss in excess of \$200,000 with machinery. Headquarters are at Louisville.

C. Billups Son & Co., Inc., Norfolk, Va., has been formed with capital of \$240,000 to take over and expand C. Billups & Son, with local plant for manufacture of agricultural and farm implements and equipment. Cecil Billups heads new organization.

Hudson Silk Hosiery Co., Charlotte, N. C., has approved plans for a new steam power plant at its mill in connection with expansion program to cost close to \$75,000.

Union Brothers, 37 West Cross Street, Baltimore, manufacturers of furniture, have asked bids on general contract for one-story addition, 52 x 300 ft., to cost more than \$75,000 with machinery. Benjamin Frank, 517 North Charles Street, is architect.

H. A. Dunham, 99 Nerrimon Avenue, Asheville, N. C., Carroll P. Rogers, Tryon, N. C., and associates have organized Feldspar Milling Co., with paid-in capital of \$150,000, to construct and operate a feldspar grinding mill in vicinity of Bowditch (Yancey County), N. C., where feldspar dikes have been secured, aggregating more than 1100 acres. Initial mill will have capacity for handling 100 tons of feldspar per day. Mr. Rogers will be president of company, and Mr. Dunham, secretary and treasurer.

Board of Education, Statesville, N. C., plans installation of manual training equipment in new three-story high school to cost \$300,000, for which bids will soon be asked on general contract by Martin L. Hampton, Statesville, architect.

United States Coast Guard Headquarters, Washington, is asking bids until Aug. 2 for construction of floating station for Louisville, consisting of steel hull, wood frame superstructure, equipment and appurtenances.

Consolidated Lumber & Milling Corporation, Norfolk, Va., care of R. T. Lipscombe, Norfolk, industrial engineer, is being organized by Mr. Lipscombe and associates to take over and operate eight lumber mills and wood-working plants in this vicinity. It is purposed to construct a central mill on tract of about 200 acres on Eastern Branch of Elizabeth River, with complete wood-working and finishing facilities, conveying and loading equipment for shipments by rail or water. Majority of equipment will be electrically operated. Entire project, including property purchases, is reported to cost upward of \$3,000,000.

Indiana

INDIANAPOLIS, July 16.—Allison Engineering Co., Speedway City, Indianapolis, has secured contract from Government for rebuilding 1500 Liberty airplane engines, totaling about \$1,000,000, and will develop complete facilities at its machine shops for work. Subcontracts will be let for machined parts, gears, transmissions, etc., including those to Indianapolis Tool & Mfg. Co., West South Street, and Link-Belt Co., North Holmes Street. N. H. Gilman is vice-president and general manager.

Board of Patoka Township School Trustees, Princeton, William E. Daugherty, trustee, in charge, will install manual training department in new two-story and basement junior high school in Baldwin Heights section, to cost about \$100,000, for which bids will soon be asked on general contract. Sutton & Routt, Citizens Trust Building, Vincennes, are architects.

Chicago & Eastern Illinois Railroad Co., 332 South Michigan Avenue, Chicago, is said to have plans nearing completion for new locomotive and car repair shops at Evansville, to cost approximately \$200,000 with equipment. L. C. Hartley, 6600 South Union Avenue, Chicago, is chief engineer.

Board of Education, Oakland City, is considering installation of manual training equipment in new two-story and basement high school to cost \$160,000, for which plans will soon be completed by H. E. Boyle & Co., Furniture Building, Evansville, architects.

Ball Brothers Co., Noblesville, manufacturer of jars, metal jar caps, corrugated containers, etc., has authorized rebuilding portion of plant recently damaged by storm, with loss of more than \$30,000.

Leader Specialty Co., 517 East Walnut Street, Indianapolis, contemplates engaging in manufacture of iron pipe nipples and is in market for equipment. C. J. Mick is secretary and treasurer.

State Line Generating Co., Hammond, an Insull interest, is preparing list of tools needed for its new power plant being built in that city.

Cleveland

CLEVELAND, July 16.—While machine business was not as lively the past week as during the previous week, dealers took a fair amount of orders for one or two machines and the volume of sales was about normal for this season of the

year. Turret lathes continue in good demand and a local manufacturer did as much business during the first half of July as in all of June, which was a good month. Orders taken by this manufacturer during the week include five or six machines for the General Electric Co. for its refrigerating machinery department at Schenectady, N. Y.

Business is well scattered among various consuming industries although not many orders are coming from automobile manufacturers. The Byers Machine Co., Ravenna, Ohio, purchased a 21-in. lathe during the week and is inquiring for a 72-in. planing machine. Some slowing down in the demand for machinery is expected during the next few weeks.

Plans are being drawn by Triplex Screw Co., 6112 Central Avenue, Cleveland, for a one-story addition, to cost about \$35,000 with equipment. A. F. Weber is head.

Federal Foundry Supply Co., 2639 East Seventy-ninth Street, Cleveland, has revised plans and will take bids at once for one and two-story addition, 90 x 255 ft., to cost about \$125,000 with equipment. F. A. Welland & Co., 2725 Pittsburgh Avenue, are architects.

American Ice Co., City Center Building, Philadelphia, has acquired Citizens' Necessities Co., Toledo, Ohio, operating ice-manufacturing, cold storage and kindred properties, for price of \$1,557,000. Same purchaser recently acquired similar plants at Youngstown, Canton and other cities in eastern Ohio, and has general expansion program in prospect, including enlargements in a number of Toledo units, with installation of additional ice-making machinery.

McKinney Tool Co., Arabella Road and Roseland Avenue, Cleveland, has plans for a one and two-story addition to cost about \$25,000. E. G. Hoefler, Keith Building, is architect.

City Council, Lorain, Ohio, is planning establishment of municipal airport on tract of 80 acres west of city, including construction of hangars, repair and reconditioning shops, oil storage and distributing buildings, etc. Mayor J. C. Standen is in charge.

Eaton Bumper & Spring Service Co., 6515 Carnegie Avenue, Cleveland, has awarded general contract to Dresser Co., Arcade Building, for one-story addition, 40 x 90 ft., to cost about \$25,000 with equipment.

Pacific Coast

SAN FRANCISCO, July 11.—Contract has been let by Simmons Co., Kenosha, Wis., manufacturer of brass and iron bedsteads, springs, etc., to Barrett & Hilp, 918 Harrison Street, San Francisco, for a three-story factory branch and distributing plant at San Francisco, to cost \$200,000 with equipment. Local headquarters are at 295 Bay Street. Ellison & Russell, Pacific Building, are architects.

Union Oil Co., Union Oil Building, Los Angeles, is planning a new storage and distributing plant at Oakland, Cal., to cost close to \$100,000 with equipment.

Arizona Magma & Mining Co., Kingman, Ariz., is planning installation of a new selective flotation plant at its Diana properties, to cost close to \$100,000. A second unit will be installed of approximately like size later.

Apple Growers' Cold Storage Co., Watsonville, Cal., has approved plans for immediate construction of one-story cold

storage and refrigerating plant, 300 x 500 ft., to cost approximately \$200,000 with machinery. Uttley & Kleindinst, 354 Hobart Street, Oakland, Cal., are engineers.

Mountain States Power Co., Tacoma, Wash., has authorized extensions in hydroelectric power plant at Big Fork, near Kalispell, Mont., with additions in transmission lines, to cost \$150,000.

Pacific Coast Cement Co., Smith Building, Seattle, has approved plans for a one-story grinding mill unit on East Marginal Way, 86 x 97 ft., to cost about \$30,000.

Mason Mfg. Co., Winston Street, Los Angeles, manufacturer of lamps and lighting specialties, cabinet products, etc., has awarded general contract to Austin Co. of California, Inc., for a one-story and basement plant, 120 x 224 ft., to cost about \$50,000 with equipment.

Henry Bittman, Securities Building, Seattle, architect, has filed plans for a six-story and basement automobile service, repair and garage building, 60 x 108 ft., to cost about \$125,000 with equipment.

National Paper Products Co., 562 Battery Street, San Francisco, has awarded general contract to Chris Kuppler Sons, Port Angeles, Wash., for construction of second unit at its kraft paper mill at Port Townsend, Wash., to cost in excess of \$350,000 with machinery. Completion is scheduled by Jan. 1. Barr & Cunningham, Spalding Building, Portland, are consulting engineers.

John Finn Metal Works, formerly at 323 Colman Building, Seattle, has removed to 1934 Railroad Avenue. Company deals in babbit metal, solders and type metals.

A. Bernth and F. W. Starkey have leased plant formerly operated by Oregon Boiler Works, Klickitat Street, Seattle, and will conduct a general business of repairing and manufacturing contractors' equipment, electric welding, blacksmithing and structural steel fabricating. Mr. Bernth is president of company and was formerly general superintendent of Isaacson Iron Works, Seattle.

Northwest Lead Co., Seattle, making lead pipe, bars, and other lead products, will build an addition at an estimated cost of \$25,000.

A. M. Andresen has been appointed acting district manager in Seattle of Chicago Pneumatic Tool Co., in place of W. S. Lynch who has been appointed district manager of Cincinnati territory. Mr. Andresen will be located at 1743 First Avenue South.

x 90 ft., to cost \$17,000, exclusive of equipment, which will be purchased later. Gustiana & Zettler, Sudbury, have been awarded contract.

Gustiana & Zettler, Sudbury, Ont., have contract for construction of a power house and heating plant to cost \$90,000 for St. Joseph's Hospital.

Erie Iron Works, Ltd., St. Thomas, Ont., has been reorganized and W. T. Greatrex, Toronto, appointed president and general manager. Premises will be enlarged and additional equipment installed.

New Brunswick Electric Power Commission, St. John, N. B., is awaiting approval of Provincial Government to proceed with erection of an auxiliary power plant to be erected at or near Salisbury, Westmorland County. Commission is also considering applications for further installation of service from Shediac to Buctouche. Hon. E. A. Reilly, Moncton, N. B., is chairman.

Fire July 8 destroyed planing mill and sash and door factory of Laidlaw-Belton Lumber Co., Sarnia, Ont., with loss estimated at \$150,000.

T. E. Bissell & Co., Ltd., Elora, Ont., has been formed to take over plant and business of Bissell & Co., manufacturers of farm implements, etc. New company is capitalized at \$300,000.

James Playfair and Frank M. Ross who control St. John Drydock & Shipbuilding Co., Ltd., have purchased plant of St. John Iron Works, St. John, N. B. Plant will be continued in operation with George H. Waring, manager, who at present is manager of Union Foundry & Machine Works, Ltd. Latter company will pass out of existence, as a consequence of property being taken over by St. John Board of Harbor Commissioners to provide harbor facilities. Playfair-Ross interests will concentrate their mill and industrial work in newly acquired iron works, and reserve drydock plant for marine and structural steel work.

Western Canada

Churchill River Power Co., Ltd., 405 McCallum-Hill Building, Regina, Sask., allied with Whitney interests in development of Flin Flon properties in northern Saskatchewan and Manitoba will install an initial power development plant of 39,000 hp., at Island Falls on Churchill River. Plant will supply power to the Flin Flon.

General Motors of Canada, Ltd., Oshawa, Ont., is having plans prepared by Hutton & Souter, 6 James Street South,

Hamilton, Ont., for construction of a power house and other buildings in connection with its \$1,000,000 plant at Regina, Sask. Tenders for additional buildings will be called about Aug. 1.

Foreign

ARRANGEMENTS have been completed by Central American Power Corporation, recently organized by W. B. Foshay Co., Minneapolis, Minn., operating public utilities, for purchase of plants and system of Nicaragua Electric Light & Ice Co., Managua, Nicaragua, Central America, for price of \$800,000. New owner plans expansion and betterment program.

American Chamber of Commerce in France, 32 Rue Taitbout, Paris, has received an inquiry (F-3700) from a company at Paris interested in purchase of American machinery for metal corrugating service; also an inquiry (G-3699) from a firm at Charente-Inferieure, desiring to purchase a quantity of American confectionery machinery.

A company in Finland has authorized plans for a new sulphite cellulose plant and will arrange list of machinery in near future. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Finland No. 68,410; also Frederick E. Lyon, commercial attaché, Helsingfors, Finland.

In connection with new newsprint and wrapping paper mill of Central Paper Trust of Soviet Russian Union, now in progress near Balakhna, on Volga River, Nijni-Novgorod district to cost \$16,000,000, an engineer of the Trust is now in United States, with headquarters at offices of Amtorg Trading Corporation, 165 Broadway, New York, official buying agency of Soviet Russian Government, to make purchases of additional machinery and equipment. Plant is expected to be completed within a year.

Central Electricity Board, London, England, is developing plans for new construction, including new generating plants and additions to present power stations, steel tower transmission lines, power substations, and distributing systems.

Company at Ravensbourne, Dunedin, New Zealand, is considering plans for a new super-phosphate plant for fertilizer service, consisting of several units to cost about \$1,250,000, with machinery. Julian B. Foster, trade commissioner, Wellington, New Zealand, has information regarding project.

Canada

TORONTO, July 16.—Following the recent lull, local dealers and builders report a revival of activities in machine tool sales. While the market is far from brisk, orders for single tools total a good volume. A strong demand is reported from northern Ontario mining districts. The automotive industry is buying sparingly at present, purchases being almost entirely for replacement.

National Standard Co. of Canada, Ltd., 133 Woolwich Street, Guelph, Ont., manufacturer of wire braid, etc., will start work immediately on a one-story addition, 62 x 76 ft., to cost \$12,000, exclusive of equipment. M. Balconi, 23 Morris Street, has erection contract.

Smith & Travers, Walnut Street, Sudbury, Ont., will erect a machine shop, garage and office building, one story, 30

New Trade Publications

Insulating Materials.—Celite Products Co., Los Angeles. Bulletin 101 of 16 pages with 30 illustrations gives general description of all Sil-O-Cel insulating products, as well as Fraxite high-temperature cement and Celcote waterproofing. The illustrations show these materials in a wide variety of uses, including furnaces of various descriptions, annealing ovens, core ovens, japanning ovens, etc.

Rotary Blowers.—Connersville Blower Co., Connersville, Ind. Bulletin 17A of eight pages, illustrated, describes rotary positive blowers for foundry cupola and large furnace installation, pneumatic conveying, cooling sheet packs, and other blower service requiring large capacity at low and medium pressure or suction. The blowers described have capacities from

4500 to 17,000 cu. ft. a minute. Dimensions and clearance diagrams are given.

Centrifugal Pumps.—Kane & Roach, Inc., Syracuse. Bulletin 1100 of eight pages illustrates and describes a line of single-stage centrifugal pumps for a variety of purposes and of varying sizes, from as low as 10 gal. to a maximum of 5000 gal. a minute. Sand and dredging pumps shown have capacity from 16 to 125 cu. yd. an hour.

Universal Grinding Machines.—Thompson Grinder Co., Springfield, Ohio. Bulletin No. 18, 12 pages, devoted to standard and special features of the 12 x 36 in. universal grinder, which is available in separate countershaft or self-contained motor-driven styles. The countershaft set-up, and the erecting plans of both styles of machine are included.

*Portable Outfits Permit Repair Jobs
Wherever the Ships Are and Save
Expensive and Time-Consuming Trips
to Shore Stations*

BY G. K. SPENCER*

DURING fleet maneuvers in the Pacific two United States destroyers came into glancing collision while emerging from a smoke screen. Boat davits and the end of a torpedo tube on one vessel were clipped off by the contact. Luckily the torpedo in the tube carried a practice head instead of a war head, or there might have been two destroyers less in the Navy.

Machinists' mates on the injured destroyer quickly swung inboard the remainder of the damaged davit and the injured torpedo tube. Later, the ship ran alongside the tender to the destroyer squadron, for emergency repairs. Within a few hours portable welders had completely repaired both the davit and the torpedo tube.

This was not an exceptional job. It was one of thousands performed every month aboard the ships of the fleet. The destroyers, being pressed for combat space, carry no portable welders, but every other ship in the fleet does. The larger vessels, such as battleships and train vessels, carry both electric and gas welding equipment.

Welding has now become one of the most important jobs done aboard

ship by the Navy. Seldom does a battleship call upon a navy yard for welding work. Welding is occasionally done by navy yard workmen upon battleships, but only when the ship is in the yard having new construction placed on her. All other welding is performed by the ship's company. So significant is this work considered, that special instruction in electric and gas welding is given the mechanical personnel at regular periods on the *Pennsylvania*, *Idaho*, *Mississippi*, *West Virginia*, *Maryland*, *California*, *Tennessee*, *New Mexico*, *Arizona*, *Arkansas*, *New York*, *Texas*, *Utah*, *Nevada*, *Florida*, *Saratoga*, *Lexington* and all the major vessels of the train, numbering some 30 in all.

To supplement this class instruction, written articles

are prepared and published in the principal journals read by enlisted personnel. So interesting have some of these naval welding articles proved that numerous requests have been received by the publishers and the Navy for copies of them for civilian shops.

Many of the heaviest welding jobs done in this country are done by the Navy. For instance, the welding of shanks to certain types of anchors involves bringing together pieces of metal as thick as

Welded Duralumin Tanks at the Naval Aircraft Factory in Philadelphia

(Top of page) Working on the bottom of a destroyer which has been raised from the water on a floating drydock at the San Diego base. A portable welder is employed in this work

*1643 Acacia Street, Los Angeles.

10 x 10 in. and larger. For a shipboard welding job, this is rather heavy.

And the mercantile marine, observing the success of the naval shipboard welding work, has now begun to carry portable welding equipment, and much good work is reported as a result. Ships' companies can be trained to this work, and considerable money saved by avoiding the cost of docking for the purpose.

Welding Below Water Level

The size and importance of jobs which can be undertaken with the Navy's portable welding apparatus are constantly increasing. Several months ago it became necessary to repair the blades of a propeller on a destroyer. It would have cost some \$50,000 for the Navy to tow the ship from Culebra Island (West Indian group) to the nearest dock at Panama, and another \$20,000 to dock her and repair her at the yard there.

With a portable cofferdam thrown around the injured propeller and the water pumped out, the ship's own me-

can be eliminated. Thus, a breakdown some distance from a yard causes long towage at a heavy expense, even though naval vessels perform the towing. A portable welder on the spot avoids such expense.

At the San Diego naval destroyer base, both gas and electric welders of the portable type are in use, with the preference going to the electric welders, which are stationed at the marine railroads of the base for exterior valve work and direct work on the bottoms. Use of these welders has created a saving in the marine docks alone of more than \$300,000 in three years. They could not be dispensed with without resultant heavy expense and loss to the Government.

A welder crew has been organized to do nothing but welding, to learn welding and specialize in it until the men become so expert in joining metals that any work they do may be depended upon completely to endure the shocks of sea duty. The first inspection made on the bottoms of destroyers coming into dock is that for the decision regarding any necessary welding.

Welded Job on a Heavy Navy Anchor (Below)

Welded Construction on the United States Aircraft Carrier Saratoga (Left). The illustration shows the unusual shape of the bow with its hawse pipe, which projects far beyond the cutwater. Welding was used on longitudinal seams and on the joints between the squared-off triangular section above the flare of the ship's side

chanical personnel went down into the cofferdam, removed the propeller and brought it to the main deck. Here, with a portable welder from the *Altair*, tender to the twelfth destroyer division, the complete repair was made.

It is especially to be noted that in performing a great the Navy for portable welding equipment quickly translates itself into savings of hundreds of thousands of dollars within a short period. It is still somewhat less than 18 months that this widespread use of portable equipment has been in practice, but the saving alone in that time has been in excess of \$300,000. The cost of all the equipment used was under \$60,000, and it is still as good as new. This would represent a great saving in any industry.

It is especially to be noted that in performing a great part of its welding at sea, the Navy does not in reality take any significant business away from the civil industry, for the navy yards are maintained at a constant employed rate, anyhow. On the other hand, naval purchases in welding equipment for use at sea have been a real boon to the industry in several ways, not the least of which has been the investment in new equipment.

Savings created by the use of portable equipment at sea are mostly in the towage and incidental expense which

The same type of portable equipment is used at the marine railroads in the Hawaiian naval district, where the service on destroyers, fast mine-layers and district vessels is similar to that at San Diego. This equipment is in daily use, and practically every ship coming into the docks needs some kind of welding work done. Welding junctures are always made in cases of installation or repairs to the condenser intakes, the exterior fittings which protrude at the ships' bottoms being riveted and then welded, to insure watertight integrity.

The welded job has come into higher favor daily. Practically all naval aircraft fuselages today are welded tubing, and the desire for the welded construction by the naval service is now practically universal.

Union wages show an increase of 260 per cent over the hourly rates of 1913, according to figures developed by the United States of Labor Statistics. They cover 862,308 trade-union members employed at time rates in 66 leading cities. Because of a decrease of 7.6 per cent in hours of work a week, the increase in weekly income was only 229 per cent.

Blast Furnace Gas Indicates Conditions

Tells Operator Much About How Fast Sulphur Is Being Removed and Whether Iron Is Fluid

BY WALLACE G. IMHOFF*

[In the first instalment of this article it was pointed out that the color of the smoke and of the burning gases rising from the open-top blast furnaces indicates the character of the metal. For example, heavy, white smoke and burning flames of bright yellow are given off when a hot, limey furnace is making low-sulphur foundry iron. A particular cast (at 2 p. m.) was cited as a typical illustration of ideal conditions of lime combining with sulphur to form calcium sulphide.—Editor.]

RESULTS of the conditions present at this time (2 p. m.) are reflected in the iron and slag analyses. In percentages these are:

Iron				Slag	
Silicon	Sulphur	Phos.	Mang.	Silica	
3.00	0.016	...	...	29.06	
2.95	0.014	...	...	Alumina	14.52
2.55	0.038	0.58	0.72	Bases	51.42
2.97	0.029	...	...	Sulphur	2.60
3.03	0.027	...	...		

The 2 p. m. cast, with an analysis of 2.95 per cent silicon and 0.014 per cent sulphur, illustrates furnace conditions in which practically all of the sulphur going into the furnace is in the combined state in the form of CaS. This is shown by the low sulphur in the iron and the high sulphur in the slag.

When the iron was cast it was extremely hot. There was a large amount of graphite present and the iron had a tendency to be thick and mushy. A noticeable feature was the extreme heat of the iron. It also had a purple glow, due to the presence of manganese.

Since the kind of iron made is governed entirely by the slag characteristics, a moment will be devoted to a description of the slag. The first flush of cinder was very hot, with extremely heavy white clouds of fog, or smoke, rising from the slag runner. The cold slag samples had a tinge of greenish white on top. The second flush of cinder before casting was practically the same as the first. It was perhaps a little hotter, and heavy, dense white clouds of smoke rose from the slag runner. The third and last flush of cinder before casting was dazzling hot. Dense clouds of white smoke rose from the slag runner. The cold slag sample was between a hard, stony cinder and a grainy slag. It was greenish white on top, the green color being due to manganese.

Reactions Inside the Furnace

Details of the conditions which produce a heavy yellow flame accompanied by dense white smoke having been described, it now remains to explain the chemical and metallurgical reactions going on inside the furnace. The large amount of sulphur going into the furnace, derived from the coke and the pyrites cinder, requires a large amount of lime to combine with it and remove it in the form of calcium sulphide. The heavy lime calls for the great amount of heat referred to, since as a slag becomes

more basic in character a greater amount of heat is required to melt it and keep it fluid.

But the higher the hearth temperature, the more the reduction of silica from the slag to silicon, which goes into the iron. The silica gives fluidity to the slag; therefore, as the amount of silica in the slag is reduced, the slag either becomes thick and viscous, if it remains at the same temperature, or must be raised to a higher temperature, to be kept thin and fluid. Since the lime is not changed, its proportion automatically increases as the silica is reduced and goes into the iron. This, therefore, also has a tendency to raise the melting point of the slag, if it is to be kept in a fluid state. On a hot hearth there is thus the tendency to decrease the silica in the slag, which automatically increases the lime ratio.

Conditions for Removing Sulphur

Turning our attention for a moment to the sulphur present, we find that the ideal conditions to promote the formation of CaS are with a hot hearth, when the bonds of lime and silica are weakened and the silica is being reduced to silicon. The lime actively takes hold on the sulphur. A large amount of it is required to remove the sulphur. The slag body itself is made up of a highly complex lime-aluminum-silicate and the CaS is dissolved in this liquid body much the same as sugar is dissolved in water.

At the high temperature, however, the slag becomes supersaturated under the conditions of pressure and temperature inside the furnace. When the slag comes out into the air, and the conditions of temperature and pressure are radically changed, the slag being supersaturated, there is a tendency then for the CaS in solution to be thrown off as a heavy white fog, or smoke rising from the slag runner. The high degree of saturation of the slag with CaS is shown by the sulphur content in the slag, which is 2.60 per cent.

High silicon in the iron tends to promote the formation of graphitic carbon, often called "kish." Carbon imparts fluidity to the iron. Therefore, as the silicon increases in the iron there is a tendency to promote the formation of graphitic carbon, which, by removing carbon from the iron, reduces its fluidity and makes it thick and mushy.

When the iron is thick and mushy and without fluidity it will not absorb manganese. Therefore, even though the furnace is very hot, a large part of the manganese goes into the slag and imparts the yellow or olive green color to it. The formation of graphitic carbon has a tendency to open the grain of the iron and make it soft. This accounts for the open grain and softness of high-silicon, low-sulphur, foundry irons.

What Can Be Learned from the Gas

Turning our attention to the gas produced under these conditions, we note that we get some factors directly, and others we get indirectly. For example, the fact that the gas burns with a heavy, bright yellow flame shows the

*Metallurgical engineer, Sixty-second Street and Allegheny Valley Railroad, Pittsburgh. This is the second of three instalments of the article, the first having appeared in our issue of June 14, page 1686.

presence of a large amount of extremely finely divided carbon particles. This factor is proved indirectly by the large amount of excess carbon, in the form of graphite, floating about in the cast house air. By observation, also, the great quantity of gas is noted, showing that the conditions are such as to liberate large quantities of carbon for burning purposes.

There is a tendency for the molten iron to throw off carbon rather than to absorb it. This fact is shown in the thick, mushy state of the iron. Carbon gives fluidity to the iron and so much has been removed from it, in the form of graphite, that the iron is thick and pasty. The sulphur in the iron is low (0.014 per cent) while the sulphur in the slag is high (2.60 per cent). This fact shows that the gas contains very little sulphur, if any.

An important condition to take note of, from the standpoint of production, is the fact that the removal of too much carbon from the iron in the form of graphite has the tendency to build up the hearth and hold the iron in the furnace. This accounts for a large cast of iron when the iron again becomes more fluid. It simply dissolves up this accumulation of dry iron in the hearth. From the standpoint of production, vitally important commercially, it is not profitable to keep the furnace in this condition for any great length of time. Under these conditions production is low, and the furnace will eventually stick and slip violently, causing considerable trouble. The ultimate end is high lime, a cold hearth, "off iron" and low production.

This must not, however, be confused with conditions which give high production. The distinction is to be found in the fluidity of the iron and the slag. High production is obtained with the fusion zone in the hearth, a high hearth temperature, and enough carbon in the iron to keep it thin and fluid. Under these conditions the furnace will drive well, the gas will be in large volume, and enough carbon will be free to supply a large amount of heat to the gas. The gas will burn with a heavy, yellow flame.

Examples with heavy, hot yellow gas and good production are shown by the following analyses, in percentages:

Iron						Slag					
Silicon	1.00	0.99	1.00	1.39	1.68	Silica	33.14				
Sulphur	0.025	0.023	0.023	0.021	0.027	Alumina	12.64				
Phos.	...	...	0.232	...	...	Lime	44.20				
Mang.	...	...	1.11	...	...	Magnesia	7.23				
						Iron	0.49				
						Sulphur	2.12				
Silicon	1.12	0.86	0.83	0.90	0.78	Silica	31.70				
Sulphur	0.031	0.045	0.034	0.030	0.023	Alumina	12.66				
Phos.	...	...	0.241	...	...	Lime	45.10				
Mang.	...	...	1.06	...	...	Magnesia	7.32				
						Iron	0.26				
						Sulphur	2.17				

The fusion zone in both these examples was down in the hearth.

For high production and good, regular driving, the ideal condition is to have the fusion zone down in the hearth. This condition gives a strong, yellow gas carrying a high heating value. As the hearth becomes cold, reactions set in which tend to change the character and heating value of the gas. Gradually the volume of free sulphur increases, the amount of silica reduced decreases, the carbon has a tendency to be absorbed by the iron as combined carbon, the volume of gas produced diminishes, and the heating value becomes low. The change in color of the gas is first shown by the fact that the heavy, bright yellow gas gradually turns to orange, then to a deep blue, and finally it becomes a crimson red to violet. The volume of gas becomes much smaller, making it necessary to use coal at the boilers to keep up steam. There is also little heating value in the small volume of gas that is made.

Conditions Experienced in Practice

A few examples will show this gradual change taking place under practical conditions. The following example

illustrates the start. The gas at the boilers had slowly changed from the heavy, yellow gas to medium, light purple, carrying only a moderate heating value. The top flame was three-quarters blue and one-quarter red. The slag was limey and there was an exceedingly strong, choking smell of free sulphur rising from the slag runner. The furnace drove slowly. The top heat was 780 deg. Fahr. The bottom and hearth were cold.

The analyses show the decrease in silicon in the iron, with the corresponding increase in silica in the slag; and the drop in sulphur in the slag from 2.17 to 1.74 per cent, with the strong smell of free sulphur. The sulphur in the iron has risen from an average of 0.025 to an average of about 0.034 per cent and the gas has changed from yellow to mostly blue. The carbon, which formerly was free to burn, is now absorbed by the iron. Since carbon is the chemical element which imparts fluidity to iron, its removal in the form of graphite thickens the iron and makes it mushy. Vice versa, an increase in combined carbon makes the iron thin and fluid. The analyses of the iron and slag under conditions which furnish medium blue gas are below:

Iron						Slag	
Silicon	0.80	0.73	0.73	0.79	0.85	Silica	34.06
Sulphur	0.036	0.035	0.033	0.031	0.031	Alumina	11.76
						Lime	45.10
						Magnesia	6.73
						Iron	0.45
						Sulphur	1.74

Comparing these analyses with the previous ones for hot, yellow gas, we observe the lime is the same at 45.10 per cent. But the furnace is colder. This is shown by the rise in silica in the slag from 31.70 to 34.06 per cent and the fall of sulphur from 2.17 to 1.74 per cent. The fall of sulphur, and the high top heat, 780 deg. Fahr., show that the fusion zone is now no longer down in the hearth, but up in the middle of the furnace. The iron, which is the principal temperature indicator, has risen from 0.26 to 0.45 per cent, showing the hearth to be much colder. The slag indicates the hearth temperature.

(To be concluded)

How to Use Current Business Statistics

Almost all important business organizations now make use of statistical information for guidance of their respective activities, it is pointed out by Mortimer B. Lane of the Bureau of Census, in commenting on a study "How to Use Current Business Statistics," recently issued. Copies may be obtained at 15c. from the Government Printing Office, Washington. The meaning of the various statistical terms is explained, with examples of their interpretation, taken from the experience of business firms.

Practical application of current statistical information by American business has been, Mr. Lane said, one of the outstanding factors in the generally sustained prosperity of the country during the past five years. Previous periods of similar commercial and industrial activity have as a rule been characterized by more or less violent fluctuations. Nearly 300 instances of the use of statistics in business have been collected by Mr. Lane, who presents suggestions as to how the data may be used to the best advantage. The small business man has been particularly benefited by securing, through the use of current statistics, information he could not hope to obtain without collective action.

The rise of statistics from small beginnings to a position of such commanding importance, it was pointed out, has been a definite response to the growing needs of business. The business executive of today cannot have, either in his mind or in the possession of his own concern, all the facts necessary for intelligent business judgment. He must not only know how his firm is doing, but must compare his branch of industry with industry as a whole, and must know the buying conditions of his customers as well as the condition of his material markets.

Cost of Producing Electric Power

Consideration of Elements, Some of Which Vary
with Amount of Current Used While
Others Are Constant

BY W. B. SKINKLE*

EVIDENTLY the total cost of any product is represented by the sum of the fixed charges plus the operating costs. Fixed charges are constant and independent of amount of production. Operating costs are variable and largely dependent upon the output. There is, however, a large part of operating costs which is constant, regardless of the output. In addition there is the increment cost, which is directly proportional to the output.

Segregation of that part of the operating cost which is constant and determination of the increment cost form the major object of the paper. Careful consideration of many items, appearing at first thought to be variable in direct proportion to the load, fails to disclose a single item which does not have some constant element independent of the load. The cost of fuel is almost directly proportional to the load. There are, however, certain items, such as radiation losses, unburned fuel, etc., which will be constant, regardless of the load. This item, therefore, may be charged as 90 per cent variable and 10 per cent constant.

Working Out Costs for Hypothetical Plant

General practice indicates that steel works boilers operate at an average annual rate of about 133 per cent of rating. Consequently, in a hypothetical boiler house of 15,000 boiler hp. installed capacity, the output would average about 20,000 boiler hp. Estimates of the cost of a modern boiler house indicate that \$123 for each horsepower of rated capacity would be a fair price on which to base fixed charges. This shows an investment of \$1,850,000. Fixed charges at 13 per cent represent \$240,000 a year or \$20,000 a month. This 13 per cent is 6 per cent interest on investment, 5 per cent depreciation and 2 per cent insurance and taxes.

Constant cost of steam exclusive of fuel has been worked out at a total of 93.4c. per boiler hp.-month. As the production of steam is 20,000 boiler hp.-months each month, the constant cost chargeable against it is \$18,700 a month. This figure, which excludes fuel, is independent of the amount of steam actually produced.

Including the fuel, the constant operating costs, regardless of the actual amount of steam produced, figure out at \$1.301 for each boiler hp.-month. This makes the constant cost of steam total \$26,000, independently of the steam produced. Variable operating costs, proportional to the steam production, have been worked out at about \$3.70 for each boiler hp.-month. If M is the amount of this steam, then the total month's operating cost for this boiler plant would be \$20,000 fixed charges, plus \$26,000 constant operating cost, plus \$3.70 M , for the variable cost of steam used.

Evaluating Generating Costs on Same Basis

Cost of producing electric energy is developed along lines similar to those followed in arriving at the cost of steam. Estimates on a modern 15,000-kw. turbo-generator

station complete show a total first cost of \$1,480,000. Fixed charges at 13 per cent represent \$192,000 a year, or \$16,000 a month. Detailed calculations for the constant cost of electric energy, exclusive of steam or fuel costs, show 65.2c. for each 1000 kwhr. This cost is based on an average load factor of 48 per cent and an average of 730 hr. operation each month. This results in production of 5,250,000 kwhr. a month and represents a constant turbine-room cost of \$3,425 a month. This is independent of the amount of electric energy produced. Similar calculations show that the variable cost of electricity exclusive of steam is 5.1c. for each 1000 kwhr.

Adding the cost of steam, exclusive of fuel, to the 65.2c. above reported, the total constant cost of electricity ex-

clusive of fuel is \$1.345 for each 1000 kwhr., or a total monthly charge of \$7,060. This is a constant expense, independent of the quantity of electric energy produced.

Similarly, the variable operating cost exclusive of fuel works out to 34.8c. for each 1000 kwhr. Hence, the total cost, exclusive of fuel, for the electric plant represents \$16,000 fixed charges, plus \$7,060 constant operating cost, plus \$0.348 E variable cost, where E equals the number of thousands of kwhr. produced.

Representation of these various factors on the diagram shows the fixed charges as the line AB above the base line. Turbine-room costs are represented by the space between AB and CD and the cost of steam, exclusive of fuel, is the space between CD and EF . The fixed charges are uniform, regardless of power production. The other two items below EF show a slight upward tendency, although the greater portion of the cost is independent of the amount of power produced. Adding the cost of fuel, however, in the line GH , produces a sharp upward slope, for the fuel depends to the extent of about 90 per cent on the amount of power sent. out.

[In the paper as presented these matters were all brought out in considerable detail, with the aid of numerous graphs to illustrate the points made.]

Materials-Handling Problems Aably Met

BY C. A. MCGRODER

FAITH in the future of commercial motor transportation inspired the General Motors Truck Corporation to build at Pontiac, Mich., within the last 12 months, what is claimed to be the largest plant in the world devoted exclusively to the manufacture of commercial vehicles. Early in July, 1927, just before ground was broken for the foundations, a crop of hay was taken off the 156-acre farm on which the plant is located. On Jan. 3, 1928, finished vehicles were coming off the production line. More than 750,000 cu. ft. of earth had been excavated from the hilly ground of the farm. Approximately 9000 tons of structural steel, 80,000 cu. yd. of concrete, 4,500,000 bd. ft. of lumber, 93 miles of iron and steel pipe and 500,000 sq. ft. of glass had been brought in to establish new records for speed and size in industrial construction.

1500-Ft. Receiving Platform for Motor Truck Freight

The same faith in the future of motor truck transportation that built the world's largest truck plant is evi-

denced in the facilities provided at the new plant for the delivery of materials and parts by motor truck. Running down one side of the main building for a distance of 1500 ft. is a receiving platform for incoming truck freight, exclusively. On the other side of this building, which is 240 ft. wide, is a similar platform of equal length, for receiving rail shipments. Such ample provision for rail freight is not unusual, but the setting aside of an equal amount of space for truck delivery of materials is something of an innovation.

Materials handling became a major problem in planning the layout of the new plant when it was decided that at least four distinct assembly lines would be required for the complete General Motors commercial line, embracing motor trucks, taxicabs and motor coaches in a diversity of sizes, models and tonnage. If these assembly lines had been located on the main floor of the building between the truck receiving dock and the rail receiving dock, great difficulties would have been encountered in moving materials to the two central assembly lines. Overhead conveyors would

THE Chain Escalators, at the Right, Bring Wheels and Tires and Other Minor Assemblies Up to the Chassis Assembly Line on the Second Floor of Main Plant

One of the Many Railed Hatchways on the Second Floor of the Chassis Assembly Plant Is Shown Below. The power plant pictured has been assembled on the ground floor and comes up to chassis assembly line on an electric hoist

have been required to lift materials over the outside lines and drop them near the central lines. Delay and confusion on the outside lines would have been the unavoidable result.

Two-Floor Arrangement of Chassis Assembly Plant Minimizes Cost

The difficulties were obviated and the cost of handling the materials was minimized by locating the chassis assembly plant on the second floor of the main building. This second floor terminates at the rear of the building in a hillside, where the heavy chassis frames are unloaded from freight cars on a railroad siding which is on a level with the second floor of the plant. Loaded upon storage and transfer cars, the frames are taken into the second floor to the beginning of the assembly lines. This leaves the entire ground

n Truck Plant

floor below the assembly lines available for the receiving, storing and sub-assembling of all the principal units and parts of the chassis except the frame.

Frames for the smaller units, such as light trucks and taxicabs, arrive at the plant completely assembled and ready for the chassis assembly lines. Larger frames, for 2-ton and larger trucks and for coaches, on which standardization of frame length is impossible because of the great variation in wheelbase length, are delivered unassembled. Space is provided between the freight car siding and the beginning of the chassis assembly lines on the second floor where the frame members are riveted to-

THE Receiving Dock For Truck Freight, Shown at the Left, Is 1500 Ft. Long. Many of the parts used in building General Motors trucks, coaches and taxicabs are shipped by truck from other plants in Pontiac, other Michigan cities, from Cleveland, Detroit and Chicago

All Rail Shipments Except Chassis Frames Are Unloaded From the Railroad Receiving Dock Shown in the Insert Above

gether before being placed on the lines. As there are always some chassis parts, such as frame brackets, which require machining, space for these operations is provided near the beginning of the assembly lines. The parts are brought up from the floor below on escalators and deposited near a battery of standard machines at this point.

After the necessary fixtures and brackets are attached to the frames, which start their journey along the assembly lines bottom side up, axle and spring assemblies are brought up from the ground floor by electric hoists, through open, railed hatchways, and dropped into position on the frames by the same hoists. Continuous chain conveyors bring up wheel and tire assemblies and other parts that are to be attached to the lower side of the frame. This accomplished, the partially completed chassis is turned over on the assembly line and proceeds on its own wheels to subsequent assembling operations.

Materials and Parts Fed Into Assembly Lines from Sides of Building

Here can be noted the most economical feature of materials handling made possible by the two-floor construction of the chassis assembly plant. There is little or no movement of parts and materials on either floor in a direction parallel to the assembly lines. All the materials handling is across the width of the building, from the receiving platforms toward the center of the building and up through

the hatchways to the assembly lines on the second floor. This economy is effected by landing incoming materials at points on the receiving docks almost directly under the place where they will be required on the second-floor assembly lines. Each bay on the receiving docks is numbered. A motor truck arriving with a load of wheels or tires is assigned to a section of the truck receiving dock near the rear of the plant and almost directly under the hatchway nearest to the point on the assembly line above where wheels and tires are attached to the chassis frame, just before it is turned right side up to proceed on its own wheels.

An incoming freight car loaded with truck engines is spotted on the siding at the rail receiving dock at a point nearer to the front of the building where the power plants are assembled on the ground floor and sent up to the second floor through the hatchway nearest the point on the assembly lines where the power plants are put in place on the chassis. In the case of engines and other heavy parts the same electric hoists that bring them to the upper floor drop them into position on the slowly moving chassis in one handling operation. Sub-assembly lines on the first floor move across the width of the building toward the center, ending under the second floor assembly lines. Motor and transmission assembly, including electrical units, is accomplished on roller type conveyors, one for each type of power plant, each ending under the hatchway through

FLOW Plan of New General Motors Truck Plant. The routes of chassis and body assembly lines, which merge near the front of the plant and flow together toward shipping platform and storage space, are shown

which its engines pass to the floor above. Cowls and instrument boards are another separate sub-assembly line on the ground floor, ending under the point on the second floor where they are put in position on the moving chassis.

By the time the chassis reaches the end of the assembly conveyor line, near the front of the plant, all of the primary assembly operations have been completed and the unit is ready for dynamometer testing. Oil and gasoline have been provided through pipe lines which terminate over the ends of the assembly lines. The units are driven to the dynamometers on their own power. An unusually large battery of dynamometers, 20 in all, extends the full width of the second floor of the main building. They are provided with quickly adjustable jacks to meet the variations in wheel-base lengths. Each unit is subjected to a 90-min. test in all speeds and up to full throttle operation. Rollers under the rear wheels of the vehicle being tested absorb torque and operate electric generators mounted under the floor. There are mileage and speed recording speedometers as well as fuel metering tanks for fuel economy tests.

Second Series of Conveyors for Chassis Painting and Final Assembling

After testing, the vehicles are driven down long ramps that terminate on the first floor, where the units are at-

tached to a second series of conveyors for the chassis painting and final assembly. Here the chassis are cleaned by a gasoline spray and lacquered as they pass through spray booths. At this point on the final assembly lines enamelware, such as running boards, fenders, hoods, etc., are added to the chassis, brought from the huge storage rooms located under the ramps. After these operations are completed the vehicles are driven from the ends of the secondary assembly lines into a transverse section of the plant which runs at right angles to the chassis assembly conveyors. Here the bodies, brought from the adjoining body department by overhead electric cranes, are mounted on the chassis. The vehicles then make another right angle turn toward the rear of the plant, into the shipping warehouse. Across the rear end of this warehouse is a loading dock, 60 ft. long, which lies between the warehouse and the ends of the loading tracks. Vehicles can be loaded from this platform either into end-door or side-door box cars or they may be run down between the loading tracks and loaded into the cars, circus fashion, by use of skids.

Vehicles that are to be exported pass directly from the warehouse to the export loading dock, where they are disassembled and boxed. Export boxes are made in this department, the lumber being brought in on transfer cars from a lumber storage yard just outside. Completely boxed

COMPLETED Chassis Are Driven Down Large Ramps to the Ground Floor of Main Building Where They Meet the Body Assembly Lines. Heavy trucks and coaches can be driven down these ramps eight abreast

LARGEST Of the Four Chassis Assembly Lines Is That on Which the Yellow Coach, Gas-Electric Chassis Are Assembled. The view at right is of the end of the line where the last operations on the chassis are completed before the vehicle is driven down the ramps to the ground floor

FRONT elevation of the New General Motors Truck Plant at Pontiac, Mich., Showing Second Floor Chassis Assembly Lines and Facilities for Receiving Both Truck and Rail Freight. Materials and parts are moved toward the center of the plant by a network of overhead chain and electric hoists running on mono-rails. After sub-assembly operations are completed, the parts are lifted to chassis assembly lines through hatchways by electric hoists

View of Light Truck Assembly Line on Second Floor of Main Building. The vehicles proceed on their own wheels, drawn by chain conveyor

vehicles are picked up by a traveling crane and placed upon flat cars which are run into the building on an inclosed siding.

Wood Refuse from Body Plant Conveyed to Boiler Room

The initial department of the body plant is a battery of kilns which lies between the green lumber storage and the dry lumber storage. Material from the dry lumber storage is delivered to the wood mill by traveling cranes which distribute the lumber to the stock saws. Wood refuse from the wood mill is transferred, by means of an exhaust system which is connected with all woodworking machines, to the power plant where it is burned in a special boiler which is adapted to the burning of pulverized coal or sawdust. Refuse from the wood mill, other than chips and sawdust, is collected from the machines and ground into chips by a "hog," from which the chips are drawn into the exhaust system and conveyed to the boiler room.

Adjoining the body frame department is the sheet metal

department, located in the same crane bay which serves for handling export shipments at the other end of the building. Sheet steel is received in gondolas in 10-ton bales which are removed from the cars by the crane and stored near the sheet steel presses. From the crane bay the sheets progress through the sheet metal department toward the body assembly lines, undergoing various machine treatments. Truck, coach and taxicab bodies are manufactured here. Each type of body is handled upon one of four conveyor chains which move the bodies through their various assembling operations.

After being completely assembled the bodies move from the body assembly conveyors into the lacquer booths. Parallel to the lacquer rooms is a series of drying ovens for accelerating the drying of priming coats. The last operations upon the body take place under a crane bay, which makes it possible to mount the heavier body types with the help of the electric crane. The completed vehicle is now ready to be driven out of the plant.

Quenching in Hot Salt Baths Recommended

PROFESSOR K. HONDA and one of his associates, K. Tamaru, have heated a Swedish steel (0.89 per cent carbon) 15 min. at 800 deg. C., then quenched it in mercury or salt baths at various elevated temperatures, and investigated the resulting properties. It is well known that drastic water quenching (to be followed by a draw) is liable to cause cracks either large enough to cause instant rejection, or if undetected to cause rapid failure under alternating stress. Since the experimenters believe that austenite must pass through martensite before reaching a pearlitic condition, irrespective of the cooling velocity, they attempted to discover such a quenching rate that the expansion occurring during the austenite to martensite change would be counterbalanced by the contraction occurring in further decomposition of the martensite, taking place simultaneously in adjacent regions. Results are given in *Science Reports*, Imperial Tohoku University, January, 1928.

quenching bath is below 120 deg. C., for then the surface layers contain more arrested austenite than the core and consequently are under tension. When the quenching bath is from 150 to 200 deg. C., no arrested austenite is found near the surface and the inner portion is martensitic and contains only a very small amount of troostite; hence the shell is under compression. Although the specimen is very hard it seldom cracks. Such conditions are ideal for the preparation of sound steel parts.

Variations in tensile strength and impact resistance are also explained on the basis of observed microstructure. Sorbitic structures can be obtained by quenching in melted salt at about 500 deg. C., and give physical properties "not inferior to those after water quenching and tempering." Furthermore this is thought by the authors to be a simpler method of heat treatment and one which avoids the danger of quenching cracks.

BRINELL HARDNESS NUMBERS OF QUENCHED STEEL

Temperature of Bath or Draw. Deg. C.	Time in Hot Quenching Bath			Water Quenched and Tempered
	1 Min.	10 Min.	20 Min.	
100	664	664	640	685
200	589	620	615	600
250	582	583	484	540
300	507	501	435	505
350	400	430	385	480
400	375	395	370	410
500	364	370	350	325
550	358	360	...	290

Mercury was used for quenching temperatures up to 150 deg. C.; above that, a eutectic mixture (65:35) of potassium and lithium nitrates. Hardness tests are summarized in the table. It will be noted that, if the quenched steel is allowed to remain in the hot quenching bath a considerable time (20 min.), the hardness is somewhat reduced because the martensite has more opportunity to decompose further into the soft sorbite and even pearlite.

The table shows that the decomposition temperature of martensite also falls with increased time in the hot bath, as follows:

Water quenched..... 270 deg. C.
One minute in hot bath..... 280 deg. C.
Ten minutes in hot bath.... 250 deg. C.
Twenty minutes in hot bath. 230 deg. C.

A second elbow in the curve for water quenched steels, at about 430 deg. C., represents the hardening effect of recrystallization on reheating.

Cracking always takes place if the temperature of the

Curious Use of Pig Iron

In the days of sailing vessels much pig iron was used as ballast. The British Navy, in particular, had definite specifications for iron to be used for this purpose. Its contract called for iron which was to be "good, sound merchantable and not to break." Two sizes were specified, measuring respectively 6 in. square and 3 ft. long and 4½ x 6 in. in section and 18 in. long. It was stipulated that 5 cu. ft. of these pigs were to weigh 1 ton.

As sailing ships gradually went out of vogue (and out of commission) they landed their ballast at the dockyards, and the accumulation of pig iron from this source, reaching at one time nearly 40,000 tons, became a matter of embarrassment, according to the *Engineer* (London). Attempts to dispose of the material had little success, as the metal was found unsuitable for foundry purposes. It varied in characteristics, from pig to pig. In a period of 6 years only 1823 tons were sold, at a price averaging about 47s. (\$11.50) a ton. Ultimately, much of the iron remaining in stock was used in making roads, which in time were found to show very little deterioration.

In apportioning freight cars for their work the *American Railway Association* estimates that 454,760 cars will be loaded with iron and steel products in the third quarter of 1928. This is an increase of 4.8 per cent over the 433,823 carloads of the corresponding period in 1927.

Top-Fired Annealing Furnaces

Arrangement for Controlling Gas Flow Through Manifold and
for Providing Uniform Temperature—Control
Located in Front of Furnace

BY OLIVER P. LUETSCHER*

UNUSUAL features in applying the fuel supply have been incorporated in annealing furnaces in the plant of the Acme Steel Co., Riverdale, Ill. This installation, under the design of the writer, consists of a

into two valve casings, one at either side and at a level near the crown of the furnace. From the two valves the gas is led into two manifolds or headers along either side of the furnace and above the crown. The center lines of

AT Left Are Shown the Gas Connections Between the Main and the Furnace, Together With the Valve Casings Through Which Gas Passes from the Vertical Legs

AIR-CONTROL Mechanism Is Shown at Right as It Is Placed Above Each Furnace. The regulation valves serve to adjust the flow of air

set of furnaces used for annealing strip steel, both in nested coils and in flat, piled, cut lengths. The method of handling is the usual one for box annealing strips, sheets, tin plate and other similar products.

Raw producer gas from a mechanical producer is brought to the furnaces by steel plate flues lined with insulating brick. It is the method of applying the gas which is entirely new and was developed for this installation. Gas is brought from the main into a vertical leg in the center at the back of the furnace. From this leg gas passes

these manifolds are parallel to the side walls and slightly within the line of the inner surface of the walls. The arrangement, which may be seen clearly from the photographs, serves to settle out most of the soot or dust in the gas. This is removed periodically from the clean outdoors in the leg and casings.

From the two manifolds the gas passes into the furnace chamber through a series of ports. These are located below and in line with a series of cast iron saddles on the lower side of the manifold and resting on top of the furnace. The ports are lined with refractory burner blocks

*Mechanical and metallurgical engineer, Peru, Ill.

to maintain ignition and slow down the flame. Immediately above the ports and in line with them another series of saddles, resting on top of the manifolds, carries the air-regulating mechanism.

This consists essentially of a nozzle which combines the function of directing the air and regulating the proportional flow of gas to the port which it serves. Each nozzle is carried on the end of a long stem which projects beyond a stuffing box in the cover of the saddle. The stem has an enlarged portion which is grooved to engage a pair of pawls. This arrangement permits the nozzle to be set in any desired position to give the proper gas opening between the nozzle and the seat below it. At the top of

Front of One of the Group of Five Furnaces, Which Are Side by Side. Control chains hang before each door. Car bottoms roll in on balls in grooves

the stem is an air-regulation valve, which serves to adjust the flow of air to the nozzle in the desired amount.

A peep hole at this point permits the operator to view the flame from that particular port. There is also provision to allow the nozzle to be lowered on to its seat and to clean off any accumulated tar or soot by the rotation of cleaning vanes. Air is brought to the individual ports by manifolds located parallel to the gas manifolds. These

are carried in brackets on the upper saddles and a flexible connection brings the air to each nozzle stem.

Direct operating control of the furnace is obtained by the two main gas valves at the back and by two corresponding air valves in the air manifolds. The air and gas control at each port are for adjustment of the separate ports. The operating control is brought to the front of the furnace, where it is actuated by hand chains. This is arranged so that the operator can regulate the furnace while viewing the flame through the peep holes in the door.

It will be evident from the above that the flame enters the furnace through the roof and is projected vertically downward. Furthermore, the flame from each port can be made any desired proportion of the total. By this system the operators have found that any portion of the furnace—top, bottom, front, back or sides—can be controlled and the temperature of that particular section raised or lowered during the cycle.

Very little clogging has been encountered. On the few occasions when it has been a factor, it has been found that operation of the cleaner for a few seconds has cleared the ports. Adjustment of the individual nozzles is seldom changed, as in ordinary operation everything is managed from the floor in front of the furnace. One most desirable point is the possibility of securing smokeless operation under a slight pressure in the heating chamber, without excess air in the chamber. The closeness of control permits the operator to keep his temperature near the maximum without danger of overheating any portion of the charge. In consequence, this has reduced the time of the cycle from that required where such close control is not available.

From the mechanical standpoint the design offers the desirable feature of complete accessibility. There are no underground gas passages or small masonry ports to become clogged. All of these parts are on top of the furnace, where they can be inspected or repaired without difficulty. The entire nozzle mechanism is carried from the cover. It can be removed and a new one put in in less than 5 min. The port tiles are removable through the top of the manifold and, if necessary, can be replaced without cooling the furnace.

From the standpoint of the user, a matter of interest is the fact that the system can be applied to existing furnaces with little change. It is equally applicable to both intermittent and direct-fired tunnel kiln types of furnaces. It can be adapted also to other fuels, such as powdered coals or liquids, in combination with gas. These furnaces have been in operation about three months, but the initial experimental furnace was running for three months before that.

One Cause of Unemployment Difficult to Gage

Displacement of labor resulting from technical improvements is tending to create a perpetual problem in many of our factory industries—a problem which can be relieved only by the gradual absorption of such labor in new employments. Such absorption is continually going on, but is not reflected in the employment statistics, according to an analysis of unemployment made by the Harvard Economic Service.

"Figures obtained by responsible governmental bureaus concerning factory employment fail to tell the whole story, not merely because they are confined to factory employment, but because, from the very nature of the case, the samples represent factories which report data regularly. Naturally these are more likely to be factories of the better

grade, in which the displacement of labor through improved machinery and shop practice tends to be greater than in the average establishment.

"It is likewise noteworthy that figures for an industry do not get into the Bureau of Labor Statistics index until the industry has become well established. The result is that new industries, which may take up labor displaced by increased efficiency in older industries, go unreported in the index. Influences such as this probably account for the fact that the Bureau of Labor Statistics index of factory employment shows a decline, from 1923 to 1925, which is much greater than the decrease in employment reported by the United States Census Bureau for all manufacturing industries."

Chain Conveyor Turns Through 112 Deg.

Gasoline Engines Assembled on 480-Ft. Unit Along Two Walls
—Dollies Return on Lower Side of Run

*SECTION of Engine Assembly Conveyor
480 Ft. Long, Turning Through 112-
Deg. on a 15-Ft. Radius. The chain is sup-
ported and held in a true segment of a cir-
cle by a steel angle curved to proper radius*

SPACE limitations in the engine assembly department of the Detroit plant of the Continental Motors Corporation are responsible for the rather unusual construction of an engine assembly line conveyor recently installed by the Detroit Conveyor & Machine Co., Detroit.

When it was determined that a conveyor nearly 500 ft. long would be required, to complete all of the assembly operations on the larger types of Continental motors, it was discovered that no such lengthy space was available unless it were found possible to utilize a rather wide aisle running along the front and down one side of the assembly department. Engineers were called in to make estimates on a conveyor running along this space. But most of the plans submitted called for two conveyors, running nearly at right angles to each other and almost joining at the corner of the building. These plans would have required that part of the assembly be done on one of the conveyors, leaving the remainder to be completed on the other. This would have made it necessary to transfer the partly completed engine from one conveyor to the other, with the help of electric hoists or overhead cranes.

By using one continuous conveyor which would turn the corner of the building on a 15-ft. radius, the plan submitted by the Conveyor company eliminated all of this waste of time, power and labor. The completed conveyor, now in successful operation, is 480 ft. long and 30 in. wide, with a turn more acute than a right angle in its center—leaving a 78-deg. angle—to conform with and parallel to the walls of the building. The change in direction is 112 deg. This turn is accomplished by using a No. 678 Keystone chain, supported and held in a true segment of a circle by a piece of 2½-in. steel angle, curved to the proper radius. There is a Reeves variable-speed changer in the drive unit, with ratio 3:1. The chain proceeds at the rate of 2 ft. a minute.

Engine carriers, or dollies, are spaced 5 ft. apart along

the chain. The great variety of engines produced at this plant made it necessary that these dollies be quickly adaptable to 16 types of engines. It was also necessary that the fixture supporting the engine should swivel, so that any part of the engine might be instantly accessible from either side of the conveyor. Each dolly is built of 4-in. channels riveted to a plate, which swivels on its 4-wheeled base, allowing its load to be turned around to any position.

Because of the limited width of the aisles in which the conveyor is located, it was required that these dollies be returned to the beginning end of the conveyor, underneath the top run. As the dollies are nearly the same width as the conveyor and of a greater length, they approach the end of the conveyor with corners protruding beyond the width of the conveyor at various angles, because of the varying positions in which they are left when the completed engines are lifted from them by an overhead crane. Before they can pass over the end sprockets and begin their return journey to the beginning end of the conveyor they must be righted into a position parallel with the tracks. This is accomplished automatically by loose and tight rollers about 2 ft. apart, which true up the dollies into the correct position.

At the beginning end of the conveyor the bare engine block is attached to a dolly which has just come up empty from the lower return run. When it is lifted from the other end of the conveyor it is a complete power plant. Crankshafts, pistons, connecting rods, valves, flywheel, sparkplugs, ignition cables, timing gears, distributors, coils—in short, everything—has been added in the course of the journey, by the workmen scattered along both sides of the conveyor. The complete engine, as lifted from the assembly conveyor, is ready to proceed through the testing department.

About 90 engines are on the conveyor at one time, averaging, when completely assembled, 700 lb. each.

Manganese Mined in United States in 1926

More Ore Imported to Satisfy Growing Domestic Production of Ferromanganese—Less Spiegeleisen Made That Year

A STATEMENT on manganese and its ores for the government publication, "Mineral Resources of the United States, 1926," has been prepared by J. W. Furness of the Bureau of Mines. American production of 35 per cent ore was lower than in 1925, and imports were very much higher. Lower imports of ferromanganese followed the entry of the Bethlehem Steel Co. into the market as a seller. Spiegeleisen also seemed to be used less extensively in steel making than in former years. Comparisons follow (the figures represent gross tons of ore or alloy):

<i>American Production and Imports</i>			
35 Per Cent Ore or Better:			
American production	1925	1926	
	98,324	46,258	
Imports	615,000	738,000	
Ferromanganese:			
American production	254,005	330,070	
Imports	78,713	59,710	
Spiegeleisen:			
American production	95,890	82,982	
Imports	1,090	8,783	

Notable changes in the American mining districts were mentioned as follows:

No shipments were made from Colorado in 1926. The Leadville area, from which much ore has come, contains large resources as compared to the known resources in other States, but apparently could not produce at a profit at prices then current.

In Montana, during 1925, the Emma mine in Butte shipped 47,469 tons of carbonate ore, but only 1263 tons in 1926. Reserves were maintained during the period of active mining, and it is believed by Mr. Furness that discontinuance was caused by low returns after the railroad freights were paid. It might be noted that a calcining plant has been erected to handle these ores within the last year. Philipsburg produced only chemical ore in 1926.

Nevada increased shipments from 850 tons in 1925 to 1607 tons in 1926; the blast furnace at Provo, Utah, absorbed this increased output.

Four shippers in Virginia produced 1998 tons of metallurgical ore in 1926; three mines shipped 1499 tons in 1925.

The Crescent Mine, on the Olympic Peninsula, Wash-

ington, was the largest single producer in the United States during 1926. Up to July it shipped 3162 tons of 51 per cent ore, but at that time its developed ore was exhausted. The total production of this mine from its discovery was 16,275 tons.

"Production of manganese ore in the United States," the author writes, "is rapidly approaching a point where materially higher prices will not, relatively speaking, increase production; the hope lies in solving the metallurgical problems of low-grade ores." Of the latter, large tonnages are in sight in the Cuyuna range, Minnesota; Leadville and Red Cliff, Colo.; Grant County, New Mexico; Phillipsburg and Butte, Mont.; Olympic Peninsula, Washington; Pioche district, Nevada; Batesville, Ark., and various places in the Appalachian Range.

India Was Largest Producer

Some of the outstanding features of the manganese industry of the world during 1926 were the increased production in India in spite of curtailed exports, the large shipments from Brazil, despite large export duties, the maintenance of production in the Gold Coast, the increased production and export to world markets of the Nikopol deposits in the Ukraine and Tchiaturi in Georgia (Russia), the heavier shipments from the Netherland East Indies, the development of Australian deposits, resumption of Chilean exports, and the prospective production of South Africa. The 1926 industrial depression in England doubtless affected the world's consumption. The price of manganese ore during that year was fairly constant except for a period of depression during the third quarter. Production of ore in gross tons follows:

	1925		1926	
	Production	Exports	Production	Exports
India	839,461	738,851	1,014,928	613,536
Brazil	326,585	302,305	256,034	311,253
Gold Coast		338,657		344,933
Nikopol, Ukraine	180,000	137,000	419,000	235,000
Tchiaturi, Georgia			750,000(a)	396,537
Dutch East Indies		9,870		11,047
Cuba	23,000	23,000	10,000	8,100(b)

(a) From August, 1925, to Jan. 1, 1927.

(b) None shipped since June, 1926.

One Effect of Mechanizing Industry

INDUSTRIALIZATION of the feeble-minded is reported by Ethelbert Stewart, United States Commissioner of Labor Statistics, to be resulting from the increasing use of machinery. Operation of automatic machinery which makes little demand on the intelligence has, he says, been an important factor in opening up means of employment for substandard individuals. Employment of such workers has a tendency to depress wage levels. While these workers are more docile, and thus more easily managed, than those higher in the mental scale, they are also more liable to industrial accident and when injured are less easy to rehabilitate.

Inasmuch as 45 per cent of the men given the Army intelligence tests during the World War were found with mentalities of 12 years and under, it may be estimated that nearly 26,000,000 persons in the United States of working

age are of low average or inferior intelligence. The entire number of wage earners employed in manufacturing industries in 1925 was less than 9,000,000. With these facts in mind, Mr. Stewart points out the serious economic and social effects which would follow a general movement to industrialize the feeble-minded.

A Pacific Coast oil company, according to *Oxy-Acetylene Tips*, overhauls its pumps by reboring the cylinders and building up the bronze pistons to suit the larger diameter. A ¼-in. layer of manganese bronze requiring 54 lb. of welding rod can be welded on an old piston 6 in. wide and 30 in. diameter in 8 hours. Skillfully done, the new surface after turning and grooving is equal to a new replacement.

Steel Casing Replaces Concrete Cells

Oil Circuit Breakers Built into Steel Cabinets and Mounted on Wheels Give Many Advantages Over Older Style of Permanent Mounting in Masonry Cells

THIN steel plate is replacing more and more stone and cement in the manufacture of electrical switch gear. One item which has attracted much attention among electrical engineers and distribution men

in recent years is the automatic substation and switch house. It has become standard practice to house moderate sized switches and meters, used to connect high-voltage transmission lines with branch circuits leading to

small users or communities, in a steel house entirely weather proof and middle proof. Such equipment is placed within the steel shed and completely tested by workmen in the factory, and shipped as a unit. Arriving at its destination, it is only necessary to unload the steel house upon a dry foundation, connect the incoming and outgoing lines, close the switches, lock the door and leave it alone. This switch gear automatically clears the line in case of trouble, and re-establishes the service once the fault has cleared itself, or when normal conditions of load are restored.

Lacquered steel sheets are also being built into switch board panels, replacing marble and slate, with notable advantages in lightness and ease in fabrication and erection. But the most recent and in many ways the most interesting invasion of a field preempted by brick and concrete is in the construction of cells and housings for bus bars and heavy-duty oil circuit breakers installed in electric

Concrete Cells Leave Cramped Room for Assembly or for Repairs or Adjustments

Truck-type Oil Circuit Breakers in Operating Position in Front of Steel Housing for Bus Bars

Rear View of Removable Truck Shows Contacts for Main Station Bus Bars in Diagonal Row, and Leads to the Three Phases of the Protected Circuit at the Bottom

generating stations, in the larger substations, or on lines serving consumers of considerable current.

It has formerly been the practice to place such devices in concrete cells, built into the main structure. This requires not only some expensive form work to mold the concrete, but several erecting operations on the switch gear itself. Insulators have to be carefully set, operating rods properly aligned, motor driven mechanism for opening and closing the switches precisely located in respect to the other parts, vent pipes for oil vapors connected, and all the secondary circuits for operating motors and signal lights installed. Such erection work is so intricate that the General Electric Co.'s instruction pamphlet for the installation of these oil circuit breakers is 48 pages long, and illustrates and describes no less than 21 construction operations, each of which must be performed in the powerhouse, in cramped, often dusty, surroundings, and usually by workmen unfamiliar with the work in hand.

All this equipment has now been sectionalized and built into self-contained sets, as shown in the accompanying reproductions of photographs. The removable truck is a steel-inclosed unit, constructed entirely of steel plates bent to form and welded together into a strong, rigid, self-supporting structure. Sheet steel bar-

riers, placed between the three circuit breakers (one on each phase) divide the truck into separate compartments. Into these compartments the circuit breaker is completely erected and tested in the factory, where the facilities for such work are of the best. The power station merely has to provide the necessary smooth floor space and connect the cabinets with the incoming and outgoing lines. The convenience to the purchaser is obvious. A material saving in floor space is also effected.

An even greater advantage of the steel truck panels is their safety. The new steel construction not only removes many grave risks of accident to the operating staff, but also reduces the frequency and liability of interruption to service. Should the breaker be damaged, or need a periodic inspection, it is unnecessary for the electrician to wriggle into a tight concrete cell, in close proximity to live circuits carrying heavy voltage and current. He merely rolls the truck out and replaces it with a spare, held in reserve.

Steel is also a material which lends itself excellently to interlocking devices for the safety of the workmen. When the breaker is closed and current is passing through it, a small hand lever operating the locks at the upper corner cannot be moved. When the breaker is open and no current

is passing through, the lever may be turned to the left, which opens a switch in the motor drive (the breaker cannot then be closed by another person at a distance) and raises an anchor holding the truck in service position. The truck may now be withdrawn, but the doors cannot be opened. When the truck is pulled out, sliding doors drop over the opening into the bus-bar cells, thus preventing accidental contact with live lines. The hand lever can then be thrown to the right, and the doors in front of the circuit breakers removed. When any door is opened, a spring latch locks the hand lever, so it cannot be moved until all doors are back in place.

Taken as a whole, the development of the steel-inclosed units for central station work has resulted in economies and conveniences to the manufacturer, the central station, the electrician and the current buyer. The manufacturer does all the erection in his shop with specially trained workmen. The purchaser thus gets a more compact, reliable and better adjusted device. The substation operator has a far safer place to work, and the ultimate consumer of electricity gets nearer the goal of absolutely uninterrupted current supply. All this is made possible by the substitution of light steel sheet as a construction material for the bulky immovable concrete.

Heating Forging Steel by Electricity

IN the illustration, which is from a photograph taken in the spring and upset building at the Fordson plant of the Ford Motor Co., are shown two types of typical electric forging furnaces such as are used for heating stock for the forging of gears and other work of this character. The heating elements in the one at the right are Global

resistors, while those in the other are of the trough resistor type—troughs of silica carbide containing granular graphite. There is a large electrode at each end. Both furnaces operate at a temperature of approximately 2350 deg. Fahr. There is a forging machine alongside each heating unit.

Improved Machines for Railroad Use

Two-Spindle Rod Borer Has Attachments for Wide Range of Work—
Motor-Actuated Table Provided for 100-Ton Bushing Press

TWO machines built recently by the Niles Tool Works division of the Niles-Bement-Pond Co., 111 Broadway, New York, for use in railroad shops, are shown in the accompanying illustrations. One is a two-spindle heavy-type rod borer for a large Western railroad, and the other, a new 100-ton bushing press.

In addition to modern features of

provided. Spindle saddles are adjusted along the rail by rack and pinion. The minimum distance between spindle centers is 36 in. and the maximum distance is 14 ft. 2 in. The maximum distance from the top of the table to the end of the spindle is 30 in.

A lower rail support is bolted to the housings for steadying the ends

motor. On this table is a heavy cast-iron block or step with a U-shaped opening, on which the driving boxes would be supported when pressing out the brasses. This block may be removed when desired. It has three pins at the bottom that engage corresponding holes in the top of table for centering under the ram of press. The motor is controlled by push-button, and suitable limit switches are provided to prevent overtravel of the table in either direction. Power from the motor is transmitted to the table through worm gearing and rack and pinion.

EACH Spindle of the Rod Borer, Shown Above, Is Driven by a Separate 15-Hp. Variable-Speed Motor. A lower rail support is bolted to the housings for steadying the spindles when using trepanning cutters or box tools

The Bushing Press, at the Left, Has a Special Sliding Table, Which Is Traversed In and Out by Motor

design, the rod-borer is equipped with a number of attachments which adapt it for a wide range of boring and facing operations on locomotive connecting rods.

Each spindle is driven by individual variable-speed direct-current motor of 15 hp., which provides a range of spindle speeds from 8 to 140 r.p.m. The motors are mounted back of the crossrail, one on each end, and drive the spindles through gear boxes. The final drive is by worm and worm-wheel, the worms being provided with ball thrust bearings to assure a smooth drive suitable for heavy trepanning.

The spindles, 5½ in. in diameter in the driving gear and 8 in. at the lower end, are of hammered high-carbon steel. The vertical travel of the spindles is 22 in. In addition to rapid hand adjustment, fine hand feed and six automatic geared feeds, from 0.005 to 0.165 in. per revolution, are

of the spindles when using trepanning cutters or box tools. Spindle guides may be moved out of the way and the rail elevated so as not to interfere with the use of pilot bars. Two movable work tables with bushed holes in their surfaces are also provided for use in connection with boring bars with pilots at their lower ends. These tables are tongued and grooved to the main table and have facilities for clamping in position. For machining bosses on certain types of rods, each spindle is equipped with a facing head having a pilot bar which is guided by a bushing in the movable work table. The feed to the facing head is of the star type. Two independently driven pumps are provided for circulating the cutting fluid.

The 100-ton bushing press is motor driven and is equipped with a special sliding table, which is mounted directly on the baseplate and is traversed in and out by a 1-hp. reversible

Pressing in or out of brasses 20 in. long is within the capacity of the machine. The stroke of the ram is 24 in. The width between the tension bars is 34 in. and the maximum height between the top of the sliding table and the ram is 43½ in. The pump, of two plunger type, is driven by a direct geared 7½-hp. motor.

Nearly 400 acres will be covered by London's reconstructed Croydon airport which is nearing completion, according to reports received by the Department of Commerce from Trade Commissioner William M. Park, London. More than \$1,000,000 has been spent on improvements.

Rotary compressors are covered in a 40-page pamphlet of R. Planche & Co., Villefranche, France. The study, in English, takes up several methods of design and operation.

Brick Cleaning Machine for Rapid Operation

FOR reclaiming open-hearth checker brick, blast-furnace brick, soaking-pit brick, building brick and paving brick, the Rotor Air Tool Co., Cleveland, has put a new model machine on the market. It is claimed that the machine removes the scale from refractory and regenerative brick, clay from blast-furnace brick, and mortar and cement from paving and house brick. It may be used also for cleaning skewbacks and for the general shaping of brick.

Below the main table is mounted a main shaft running in four Hyatt

of ample power, with variable-speed control and push-button starter, is provided. This motor is direct connected to the main shaft through a flexible coupling. The entire machine is mounted on a four-wheel truck arrangement with a heavy steel tongue, which makes it readily portable and permits it to be rolled from place to place, or to be pulled by a tractor.

It is claimed that with a crew of three men this machine will clean 3000 9-in. bricks in a 10-hr. day. Two men feed brick through the two halves of the machine, while the third man

the usual hand-chipping methods. Tests have shown that the cost is usually less than 1c. per brick, including interest on investment, cost of cutters, current consumption and direct labor cost.

Each head on the machine delivers 600,000 blows a minute. The surface of the finished brick is left entirely free from scale, and it is claimed the breakage is practically negligible, because of the lightness of the individual blows. The machine may be adjusted to perform satisfactorily on a great variety of sizes and types of

Cutter Guard Disks in General View Hide the Cutters, Shown in Detail Above

roller bearings. Two special cutting heads containing the cutting members are mounted on this shaft, with special provision for quick and convenient installation and removal of cutters. The two cutting heads project slightly through two slots or ports in the table. The table itself is hinged at the back end, with a positive screw adjustment to raise or lower its forward end. This adjustment gives the desired amount of contact and blow required for the brick being cleaned. The bricks are handled in exactly the same manner that a piece of wood is planed or shaped on a wood jointer.

The openings in the table are directly connected to an exhaust blower which drives to a convenient place the dust and lighter material removed. Immediately below the cutter heads two automatic dump doors are mounted. These are counterbalanced so as to trip and discharge waste material automatically as an accumulation is formed.

Four aluminum guards mounted with rubber tires appear above the tables. These guards open up as the brick passes over the cutters and then close automatically. They are controlled by a spring appearing in the detailed view, being so adjusted as to offer practically no resistance to opening for the brick. They do not act as guides, as the brick can be passed through them at any angle.

A fully inclosed, dust-proof motor

stacks the cleaned bricks. This compares with maximum production of 900 9-in. bricks for three men under

brick. Patents have been applied for in the United States and foreign countries, to cover the essential features.

Properties of Metals at High Temperatures

Progress in investigations of the effect of temperature on properties of metals is reported by G. W. Saathoff, chairman of the joint committee having the work in charge for the American Society for Testing Materials and the American Society of Mechanical Engineers. The committee's series of long and short-time tests on a variety of metals are being continued through the cooperation of some twenty industrial and government laboratories. As these tests must be fitted into the routine schedule of these concerns, results, it is emphasized, will necessarily be somewhat slow in developing.

With the financial support of a group of steam-turbine manufacturers fatigue tests on metals at elevated temperatures are about to be started at the University of Illinois Engineering Experiment Station under the direction of Prof. H. F. Moore. From a year to 18 months will be required to complete this investigation.

Arrangements are also being completed with another university for the conduct of a group of thermal conductivity tests on the five classes of metals now being investigated by the 20 laboratories mentioned above.

Of particular interest is the announcement by the committee that a large amount of service information on alloy metals at elevated temperatures has been collected from industry and tabulated. Publication of these data may be expected shortly.

Non-Technical Bulletins on Welding

An elementary discussion of the relation between carbon and the properties of welding rods and joints made therewith is contained in Bulletin No. 128 of the Fusion Welding Corporation, 103d and Torrence Avenues, Chicago. It is planned to issue an extended series of such pamphlets considering various phases of the art, and these publications will be sent to anyone interested on request.

Tumbling Barrel Avoids Handling of Stars and Sand

A NEW type of tumbling barrel has been brought out by the Ideal Industrial Machinery Division, Winton Place, Cincinnati. Known as the star return tumbling barrel, it was especially designed for cleaning drop forgings, heavy stampings and castings. The complete line includes machines of several sizes and capacities, ranging from those having an 18 by 24-in. tumbling compartment, and a load capacity of 150 lb., to those having a 48 by 60-in. compartment with a capacity of 4000 lb.

Essentially the machines consist of a tumbling barrel, driving motor and speed-reduction mechanism, mounted as a unit on a heavy structural steel frame. The frame is constructed of steel angles, strongly braced by stretcher members and gusset plates, which give it rigidity to withstand the shocks and continuous vibration encountered during operation.

Both the barrel proper and the lifting and lowering motions of the loading scoop are chain driven from a common shaft. This in turn is driven through a gear and sprocket reduction train by a reversing motor. Control of the direction of rotation of the barrel is by reversal of the motor, and that of the lifting and lowering of the scoop by a friction hoist driven from the countershaft. The countershaft has a brake for control of the skip, during lowering.

The barrel is mounted on four trunnion rollers, the two on each side being mounted on a common shaft, supported in pillow blocks equipped with Timken bearings. The selection of the bearings was determined by their ability to withstand the heavy, fluctuating loads caused by the tendency of the contents of the barrel to climb part way up one side, and fall back against the direction of rotation. The housings are designed to hold a large reserve supply of

lubricant, and to exclude dust, sand and grit.

The barrel is divided vertically into two compartments, the tumbling or cleaning compartment and the separating screen compartment. The

work is discharged by reversing the direction of rotation of the barrel. This causes the mixture of sand, stars and work to pass into the screening compartment, where the stars and sand are screened and

Operation Includes Automatic Separation of the Work from the Sand and Stars, Without Need for Handling the Latter

work is tumbled with stars, or sand, together with flint shot, silica sand or steel sheet, the stars being equal in weight to the work. The parts to be cleaned are prevented from touching each other, being floated among the stars and sand. Tough scale can be removed without denting or destroying the corners of the parts, or injuring designs cast or forged on them.

When the run is completed, the

cleaned work is delivered at the end of the screen.

The stars and sand fall into the cone shaped jacket surrounding the screen and, when the barrel is again rotated in the tumbling direction, are automatically returned to the tumbling compartment. The transfer is accomplished through a patented cup arrangement, located in the head between the tumbling compartment and the screen jacket.

Monorail Trolley Hoist With Bucket

A MONORAIL trolley brought out by Edgar E. Brosius, Inc., Sharpsburg, Pa., is shown in the illustration. A number of the devices have been in service in steel plants for the past three or four years. They are of rugged construction and were designed for severe, continuous work, being built entirely of steel.

The hoist is equipped with a simple worm-gear drive. It is furnished with a hook block for handling the Brosius single-hook bucket, or the bucket can be reeved directly to the drum, as shown. The worm drive requires only a simple magnetic brake on the hoist motor for holding the load, in conjunction with dynamic braking control.

The hoist is equipped with Timken roller bearings. The trolley is simple in design, its drive being of the spur-gear type. Compactness is a feature which is emphasized.

Nine-Roll Straightener for Springy Stock

The Straightening Device Is for Light Springy Stock and Includes a Hand Feeding Mechanism

THE F. J. Littell Machine Co., 4125 Ravenswood Avenue, Chicago, has added to its line a new nine-roll straightener designed particularly for light and springy stock. This new unit, designated as the No. 2, is for material $3\frac{1}{2}$ in and less in width. A No. 3 size, with seven rolls and intended for stock up to 5 in. in width, is also available.

The device is arranged with a hand-driven feeding mechanism, so that it need not be used with a roll feed. Use of a hand feed of this type is stressed as of particular advantage when long strips have to be fed from coils and straightened. The device can be set on a table next to the power press and the stock fed to any desired length. The straightener may be used also in connection with a roll feed and can be supplied with an oiler if desired. The rolls are small and are set close together. The equipment illustrated includes a rack and pinion feed with the nine-roll hand feeding straightener and scrap cutter.

Motor-Driven Winches Arranged for Wall and Floor Use

TWO styles of reversible motor-driven winches, one arranged for wall mounting and the other for floor use, have been made available by the Stephens-Adamson Mfg. Co., Aurora,

Ill. The machines are compact and offered for a variety of applications, including the lifting of castings, light machinery, furnace doors, ventilators, walkways, counterweights, light elevators and small bridges.

The machines are equipped with worm gear reduction units which prevent accidental dropping of the load. Both the winch for wall mounting, designated as the style WK, and the machine for floor or pedestal mounting, the style K may be equipped

with 1, $1\frac{1}{2}$ or 2-hp. reversible electric motors. They are rated to pull 700-1100 and 1400 lb. respectively, at a rope speed of 25 ft. per min. Use of $\frac{1}{4}$ or $\frac{3}{8}$ in. cable is recommended, the drums being designed to accommodate 100 ft. of $\frac{1}{4}$ -in. and 60 ft. of $\frac{3}{8}$ -in. cable. All gears have cut teeth and operate in oil. The worm is fitted with ball thrust bearings which permit free operation in either direction.

Evening Course Offered in Diesel Engines

TO meet the demand for information concerning the particulars and operation of Diesel engines, an evening course is offered by the Polytechnic Institute, Brooklyn. This will be the fifth year of this course, about 400 men having taken advantage of it in the four years which have elapsed. The course is not part of the regular undergraduate work, but is designed solely for men interested in oil engines, regardless of previous education.

Twenty lectures, each of 2 hr., are given during the winter, on Tuesdays at 7.30 p. m. The first lecture will be on the last Tuesday in September, this being Sept. 25. Several varieties of oil engines are available in the laboratory for demonstration and testing.

A lecture course on Monday evenings will be given for those interested in operation, construction, selling or designing of oil engines. This class will alternate week by week between the laboratory and the classroom.

Pliers with Jaws That May Be Locked

PLIERS which take their name, Lok-Jaw, from the arrangement whereby the jaws may be locked to nuts, bolts and other objects in the manner of a hand vise, have been added to the line of the Lawson Mfg. Co., Cleveland. The device is arranged with an adjusting screw at the jaws and the compound leverage is said to provide a 1-ton grip at the jaws. The latter

are designed to fit round, square or hexagon objects.

The pliers may be clamped to a loose nut or bolt head in an inaccessible place, and will keep the nut or bolt from turning while it is being loosened or tightened with a screwdriver or a wrench. The jaws are of steel forgings, heat treated; the handles are of pressed steel and have knurled grips. In the size illustrated, the 8 in., the maximum jaw opening is $\frac{3}{4}$ in.

The General Electric Co. announces a new motor control switch suitable for reversing small alternating-current motors. The new switch is expected to find a wide application on general-purpose motors when either infrequent or frequent reversing is required.

Automatic Stock-Feed Facilitates Production of Pipe Coupling Blanks

PIPE couplings are produced on a high-production basis on the machine illustrated, a feature of which is the automatic roll stock-feed mechanism employed. The machine is a modification of the 1½ and 2-in. four-spindle bar machine of the Cleveland Automatic Machine Co., Cleveland.

The pipe coupling blanks are produced from hot rolled stock rods

arms carrying the rolls. Each pair of arms closes on a bar independently of the others and therefore variation in the size of a bar does not affect the feeding of any other bar. The four bars of stock are gaged by four stops which are mounted on a central drive shaft sleeve and have longitudinal movement with the sleeve. After gaging the stock, the stops are with-

ously, tools mounted on four cross slides form the corners of the outside diameter and cut off the blanks. Stenciling is accomplished by a pivoted sector which advances with the slide and rolls the manufacturer's mark into the blank with the motion of the stock, being held out of position after one pass. Stripping four blanks and gaging stock for the next

ARRANGEMENT of the Automatic Roll Stock-Feed Mechanism, Used on the Cleveland Automatic for Machining Pipe Coupling Blanks, May Be Noted from the View at the Upper Right. The machining operations consist of drilling, forming the corner of the outside diameter, stenciling a mark and cutting off—all of which are performed simultaneously, so that four blanks are produced between each stock-feed

which are 1 9/16 in. in diameter and 35 ft. long. The machining operations, consisting of drilling, forming the corner of the outside diameter, stenciling the manufacturer's mark and cutting-off, are performed simultaneously, so that four blanks are produced at each stock feed.

The V-shaped feed rolls, mounted on toggle arms, are continuously driven by a system of gears actuated by chain and sprocket which is geared to the lower camshaft in the rear. Cams on the same shaft control the action of air cylinders, which govern the roll mechanism, and four pistons impart a jaw action to the toggle

drawn slightly for chip clearance, and simultaneously a sliding shoe, actuated by a cam and drum on the lower shaft, operates four thimbles which close the chucks. Compression springs back of the finger block compensate for any irregularity in the stock. The feed rolls release the stock by a reversal of the air current which reverses the jaw action of the toggle arms.

When the gage stops recede, the turret advances, bearing four drills which operate through openings in the gage stops, so that the latter act as tool guides and strippers. The turret is non-indexing. Simultane-

four is accomplished by a single forward motion of the gage stops. The installation includes a support for the 35-ft. rods, consisting of four tubular housings held at intervals by adjustable standards.

Subsequent beveling of the mouth of the hole is performed on a special model J double-end machine of the Cleveland Automatic Machine Co. design, after which the pieces are tapped.

A machine of the same design as the one described and illustrated above, but without the roll feed, has been designed for use in the manufacture of nuts.

Curtailment of Operations in Europe

British Holidays Interfere With Business—Germany Facing Shutdowns in Many Mills—Weak Markets in Belgium

(By Cable)

LONDON, ENGLAND, July 23.

DEMAND for Cleveland pig iron is at a very low ebb, owing to the holidays and to poor export demand, but prices are being maintained. Hematite is dull and stocks are heavy.

Foreign ore is quiet. Northeast Coast consumers have ceased buying, as prices are too high in comparison with what they can get for their pig iron. The Swedish strike continues, and Bilbao Rubio ore is firm.

Finished iron and steel markets are quiet. Some new shipbuilding orders have been placed, but makers are relying on domestic structural and engineering demand. Export markets are virtually idle. The prime minister is to receive this week another deputation from the iron and steel industry, urging that safeguarding remedies [protective tariff?] be applied.

Tin plate markets are quiet and prices are easing. Welsh makers having decided to reintroduce a restriction of output, all mills are to close for two weeks during the period Aug. 27 to Nov. 24. Some works are well sold, but others are ready to take orders specifying August shipment.

Galvanized sheets are moderately active in small parcels, but substantial demand is still lacking. Black sheet markets are quiet.

On the Continent of Europe

Continental markets are firm, especially on semi-finished products. On merchant bar covering, billets are reported unobtainable. British demand is poor.

Russian production in the fiscal year 1926-1927 was as follows:

	Metric Tons
Pig iron.....	2,963,000
Raw steel.....	3,586,000
Rolled steel.....	2,730,000

In 1927 the average monthly home consumption of iron and ingot steel was 1,484,000 metric tons; in 1926 only 883,000 tons; and after rising to a high point of 1,718,000 tons in January, this year, it fell to 1,315,000 tons in May, and probably fell further in June. Municipalities and other public bodies are trying to devise a system by which public construction, including communications, shall be so far as possible concentrated in bad trade periods, thus mitigating the production fluctuations and consequently equalizing employment.

Orders for steel are coming in very slowly, and the mills largely depend upon old orders given before prices were raised in May. The demand for structural steel has not fallen further, but large orders are not being received. The bar market is quieter, with shorter delivery terms. Sheets are dull. For semi-finished products the demand has declined.

The dullness in export is partly connected with the Antwerp dock strike. Meantime, competition is sharp, and prices are slightly depressed. French and Luxemburg works are maintaining their prices to European buyers, but are exporting overseas at a considerable sacrifice, bars being exported at £5 12s. f.o.b. (\$27.22). Until this new export dullness, which began in June, Germany's iron foreign trade balance was improving. In May the net export of heavy iron and steel (without machinery) was 212,000 tons, the highest

Germany Expects Steel Curtailment

Not Even Greatest Conceivable Increase in Exports Can Prevent Shutting Down of Numerous Mills

BERLIN, GERMANY, July 7.—The home market has further weakened since the beginning of the month, and export is developing less satisfactorily. Düsseldorf experts declare that the maintenance of production in the second half of the year will depend

largely upon export, but add that if a really bad trade condition arrives the greatest conceivable increase of exports will not prevent closing down of numerous mills, because the fluctuations of home consumption in good and bad trade periods are too great.

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

Durham coke, del'd.....	£0 17½s. to £0 17¾s.	\$4.25 to \$4.31
Bilbao Rubio ore.....	1 2½	5.48
Cleveland No. 1 fdy.....	3 8½ to 3 9½	16.64 to 16.89
Cleveland No. 3 fdy.....	3 6	16.04
Cleveland No. 4 fdy.....	3 5	15.80
Cleveland No. 4 forge...	3 4½	15.68
Cleveland basic (nom.)...	3 5	15.80
East Coast mixed.....	3 8 to 3 9	16.53 to 16.77
East Coast hematite....	3 10½	17.13
Rails, 60 lb. and up....	7 15 to 8 5	37.66 to 40.10
Billets.....	6 0 to 6 15	29.16 to 32.81
Ferromanganese.....	13 15	66.83
Ferromanganese (export)	13 0 to 13 5	63.18 to 64.39
Sheet and tin plate bars, Welsh.....	6 0	29.16
Tin plate, base box.....	0 18 to 0 18½	4.37 to 4.43
Black sheets, Japanese specifications.....	13 7½	65.00
Ship plates.....	7 12½ to 8 2½	1.63 to 1.74
Boiler plates.....	9 0 to 10 10	1.92 to 2.25
Tees.....	8 2½ to 8 12½	1.74 to 1.84
Channels.....	7 7½ to 7 17½	1.58 to 1.69
Beams.....	7 2½ to 7 12½	1.53 to 1.63
Round bars, ¾ to 3 in..	7 5 to 7 15	1.55 to 1.66
Steel hoops.....	9 0 to 10 0	1.92 to 2.14
Black sheets, 24 gage...	9 15 to 10 0	2.09 to 2.14
Galv. sheets, 24 gage....	13 7½	2.86
Cold rolled steel strip, 20 gage, nom.....	16 0	3.42

*Ex-ship, Tees, nominal.

figure reached for more than a year. The average monthly net export in January-May was around 160,000 tons, as against 137,000 tons in 1927.

Reports from France and Belgium indicate that no material rise in iron and steel prices is expected for the present. The stabilization of the French franc will not, it is held, have any effect in restoring real gold prices for some time to come. This is deduced from the experience of Belgium, whose currency has been stable a long time, but whose price level and wages have not yet returned to a gold basis. The German *Stahl und Eisen* predicts that the devaluation of the French franc to about one-fifth of its old value will create permanently favorable competition conditions for France. This means that Germany will continue to export in competition at below her home prices and even below her production cost. Her financial ability to bear this strain seems beyond doubt. The *Frankfurter Zeitung* publishes a minute analysis of German corporation profits with the aim of disproving the contention of steel manufacturers that the recent industrial boom was a "quantity boom" and not a "profits boom." The amount paid in dividends by 85 leading corporations in different branches has moved as follows since the mark stabilization:

	Marks
1924.....	171,300,000
1925.....	218,600,000
1926.....	273,600,000
1927.....	357,900,000

The steel and coal corporations have done best of all, if not merely their dividends, but also the additions to their reserves, are taken into account. Their real earnings, without counting unrevealed additions to reserves, increased about five-fold in the three years 1924-26. Of the 85 corporations in all industrial branches, 29 paid no dividends in 1924, and only five in 1927; whereas 28 paid over 10 per cent in 1927, against only four in 1924. This analysis of corporation profits agrees with that of the official Trade Fluctuations Institute, which classes steel as one of the industries which is financially strong enough to export at a loss in times of bad home trade.

Belgian Market Tendencies Weak

ANTWERP, BELGIUM, July 6.—Market tendencies continue weak, but prices remain stationary. The general strike of dock workers in the harbor of Antwerp has made shipments impossible from this port and shipments by other ports are not easily arranged. Stocks are accumulating at steel plants, forecasting reductions in operations.

The decision of the Steel Cartel not to increase production during the quarter will support makers in their resistance to price reductions. Another factor, favorable to Belgian mills is the weak competition from Germany. Important orders have been taken by the Rail Syndicate in South America; Belgian railroads are

expected to make large purchases, and it is known that large requirements are pending in the East, where it is generally expected that buying may start very soon.

Steel bars show a narrow market on account of the limited production and owing to the fact that most makers are open only for a part of their program. German makers are entirely out of the market. The French and Luxemburg competition puts for-

ward the same prices that are quoted here. Angles are now offered freely and prices have been influenced. Structural rounds maintain a stronger position on account of lack of stock. Beams have strengthened. Rods remain scarce and firm.

Pig iron remains stationary in price. The export demand is not good. The lowest price, about \$15.40 f.o.b. Antwerp, seems to meet with strong foreign competition.

Canadian Iron and Steel Production June Considerably Ahead of June Last Year and Half-Year Output Highest in Ten Years

TORONTO, July 23.—The production of pig iron in Canada for the month of June totaled 97,379 gross tons, a gain of 11 per cent over the 87,811 tons produced in the previous month and 40 per cent higher than the 69,437 tons produced in June last year. The production of basic iron increased to 69,040 tons from 68,945 tons in May; foundry iron from 7667 tons in May to 25,968 tons in June; but malleable iron fell off to 2371 tons in June as compared with 11,199 tons in the previous month. For the first half of 1928 the cumulative production of pig iron is 468,013 gross tons as compared with 403,713 tons in the corresponding six months of 1927. This year's output included 355,802 tons of basic; 88,076 tons of foundry iron and 24,135 tons of malleable iron.

The production of ferroalloys in June totaled 4157 tons or about 3 per cent more than the output of 4049 tons of May.

The output of steel ingots and castings during June totaled 116,530 gross tons or slightly less than the 117,655 tons produced in May, but 94 per cent greater than the 59,940 tons made in June, 1927. The output of steel ingots amounted to 112,960 tons and of direct steel castings 3570 tons.

For the first half of this year the cumulative production of steel ingots and castings is 648,338 gross tons, an increase of 33 per cent over the 487,310 tons made in the corresponding period last year. This year's output to June included 625,493 tons of steel ingots and 22,845 tons of direct steel castings.

While the Canadian price of pig iron was unchanged during June, the price index of the Dominion Bureau of Statistics for iron and steel (1913=100) fell from 141.7 in May to 140.9 in June, owing to slight declines in the prices of steel bars and steel sheets.

During the month of June 8 blast furnaces were blowing as follows: three of Algoma Steel Corporation, Sault Ste. Marie, Ont.; two of Steel Co. of Canada, Ltd., Hamilton, Ont.; one of Canadian Furnace Co., Port Colborne, Ont., and two of Dominion Iron & Steel Co., Sydney, N. S.

The production of iron and steel in Canada for the first half of 1928 proceeded at a higher monthly average than either 1926 or 1927, and even passed the high average of 1923. Output was below that of 1913, however, and was only about half of the high record established in 1918 when 1,622,000 tons of ingots were produced.

Production figures from 1923 to the middle of 1928 are shown in the table at the bottom of the page.

German Tube Makers Feel American Competition

HAMBURG, GERMANY, July 6.—The German Tube Makers' Association reports that business in tubes for export to overseas countries has recently improved, but that prices are still very low because of the growing firmness of American competition, especially in the Latin American countries.

Germans Reduce Wire Rods to Regain Japanese Trade

HAMBURG, GERMANY, July 6.—A conflict has recently broken out in the German Wire Rod Cartel concerning the trade with Japan, which was taking from 5000 to 8000 tons of German rods a month until the price advance in May, when sales dropped to 3200 tons against 7300 tons in April. Growing competition of American and Canadian makers is given as the reason for the decline in German business.

Production of Iron and Steel in Canada
(In Gross Tons)

Year	Pig Iron	Ferroalloys	Steel Ingots	Steel Castings
1923	880,018	28,961	839,710	45,060
1924	593,024	26,400	625,175	25,515
1925	570,397	25,709	733,855	18,840
1926	737,503	57,416	743,550	33,338
1927	709,697	56,514	867,928	39,710
1928*	468,013	26,014	625,493	22,845

*Figures for the first six months ended with June 30.

Miners' Action an Admission of Defeat

Abandonment of Jacksonville Scale So Regarded in Pittsburgh—Union Has Lost Much Ground

PITTSBURGH, July 24.—Important coal producing interests, including the steel companies which operate their own mines, view passively the decision by the wage scale committee of the United Mine Workers of America withdrawing the Jacksonville wage scale as the sole basis of negotiations for working agreements between operators and the union. The prevailing opinion among coal producers is that the decision amounts merely to "locking the stable door after the horse has been stolen."

Southern Ohio operators, not long after the suspension resulting from the inability of the producers and union leaders to get together when the Jacksonville scale terminated by limitation, attempted to open negotiations on much the same terms that now are acceptable to the union leaders. The offer was rejected almost without consideration. In the Pittsburgh district it was the stand taken by the miners' union officials rather than animosity toward the union that prevented a renewal of the agreements. The abandonment of the demand that proved to be the stumbling block in continuance of the operation of many mines in the district under signed contracts with the union is looked upon as an admission of defeat by the union.

A Serious Blow to the Union

Close students of the situation, however, regard it as something more serious for the union than merely the loss of the strike which started April 1, 1927, because they see no disposition on the part of the operators who formerly worked their mines on a union basis to respond to what amounts to an invitation by the union to resume negotiations. The Pittsburgh Coal Co. and the Pittsburgh Terminal Coal Co., the two largest commercial producers in the Pittsburgh district, have publicly stated that they have no intention of resuming relations with the union, while the industrial mines, which have been operating for more than a year on an open shop basis, also are unresponsive to this attempt to get them back under union domination. The operators of southern Ohio, likewise, are adamant.

The common condition at the time of the expiration of the Jacksonville scale was that, since the union insisted on the scale established in Jacksonville as a primary premise and the operators could not pay that scale and compete with the open shop mines, a conference on wages would be futile. The feeling now is that there is no occasion for a conference, as the open shop has been established and with it there has been set up an equality of wages in the different producing districts that has settled a

very vexing problem for the national industry.

The coal industry could not exist half union and half non-union, since the half working union would have to pay higher labor charges than the half where the control of wages was in the hands of the employers, and the producers with the lowest labor costs naturally dominated the market, subject only to the limitation of freight charges to destinations. If the union had been successful in unionizing the open shop mines and had brought about a level scale of wages for all fields the story might have been different. Since it failed, it was only natural that the trend should be in the other direction and that union mine operators should place themselves in a position to meet the competition provided by the open shop producing districts. The union leaders took the position that, if they accepted lower wages for union miners, the non-union miners' wages would suffer correspondingly, and the situation would be as before, with a high scale in the union mines and a low one in the non-union operations.

Open Shop Miners Apparently Satisfied

Such reasoning did not recognize the changed attitude of employers toward employees that developed several years ago. It has long since ceased to be the fashion to get as

much out of labor as possible for the least amount of money and more the vogue to pay wages that enable the workman to live and put something aside. There is no evidence that the coal miners who have been working on the open shop scale of wages in this district are dissatisfied. The wage scales are fair and between steady work and the saving of union dues and assessments the pay envelopes generally are stouter than they were when the men were working on part-time schedules.

In the last previous strike, in 1922, the union lost northern West Virginia as a unionized district. While there may be some tonnage mined in the Pittsburgh district under union auspices, the preponderance of the tonnage will be of non-union coal and to a large degree the union will have lost this district. It also has probably lost ground in Ohio, Indiana and Illinois.

An uneconomic policy is responsible for the position in which the union now finds itself. If the leaders had taken the same attitude as the railroad brotherhoods, the position of the union would have been stronger. Recognition more promptly of changing market and industrial conditions would have promoted sustained relationships with the producers. And the steady flow of funds into the union treasury, as a result of the check-off or the company collection of union dues and assessments, would have made the miners' union even more powerful financially than the railroad brotherhoods. The miners' union has lost much more than the strike that started 15 months ago.

E. Arthur Tutein, Inc., Asks Extension from Creditors

E. Arthur Tutein, Inc., Boston and New York pig iron merchant, has asked creditors for an extension of six months for a settlement of claims. Approximately 95 per cent of the creditors have consented to such an extension, pending the outcome of the company's suit against the Hudson Valley Coke & Products Corporation, and a counter suit against E. Arthur Tutein, Inc., by the Troy, N. Y., company, the result of the termination of a selling agreement.

What course E. Arthur Tutein, Inc., takes within the immediate future will depend on action to be taken this week by creditors at a special meeting. Mr. Tutein has offered to serve as president of the company without compensation during the liquidation of the assets now available.

On Friday, July 20, the New York Court of Appeals ruled that Charles M. Schwab had previously and still has the right to appoint the third arbitrator in the controversy between E. Arthur Tutein, Inc., and the Hudson Valley Coke & Products Corporation. It was contended by the Hud-

son Valley company, Mr. Schwab's authority in the matter had lapsed, because the arbitrator he appointed declined to serve. It is probable that the third arbitrator will be named shortly and that hearings will be begun.

Purchases Ashland Steel Co.

Purchase of the Ashland Steel Co., Ashland, Ky., by the American Rolling Mill Co. has been announced by George M. Verity, president of the latter company. The plant of the Ashland Steel Co. adjoins that of the Norton Iron Works Co., which was bought by the American Rolling Mill Co. early in 1927. The property was acquired from the First National Bank of Ashland, which took it over when the steel company failed two years ago. The purchase price has not been revealed, nor what disposition is to be made of the plant. The Ashland and Norton companies, although owned independently, were originally operated jointly, the Norton blast furnace supplying hot metal to the Ashland mills for the manufacture of steel rods and wire.

National Fuels Meeting in Cleveland

The second national fuels meeting will be held at the Cleveland Hotel, Cleveland, Sept. 17 to 20. The technical contributions will include the following, presented under the auspices of the Fuels Division of the American Society of Mechanical Engineers:

Constitution and classification of coal, and fuels and their flame characteristics with reference to combustion values and furnace-space requirements; direct firing of boilers with producer gas; Texas lignite as fuel for power-plant boilers, and washing and preparation of coal; relative values of solid, liquid and gaseous fuels; industrial furnace efficiency; collecting dust from chimney gases in powdered-fuel installations; unit system of coal pulverizers, and boiler-furnace refractories, and stoker advantages and difficulties.

Mystic Furnace Complains of Pig Iron Freight Rates

The Mystic Iron Works, Everett, Mass., has filed with the Interstate Commerce Commission a complaint against New England railroads, which is directed primarily against the New York, New Haven & Hartford, although the Boston & Albany, Boston & Maine, Maine Central, Rutland and Central Vermont roads are also named as defendants.

It is claimed that freight rates on pig iron from the blast furnace at Everett are excessive and discriminatory, and the commission is asked to compel the carriers to put into effect reasonable rates and to pay the Everett company as reparation the difference between freight charges actually paid in the past and such rates as may be found reasonable, together with interest at the rate of 6 per cent.

It is the contention of the management that the Everett furnace was built with the assurance of the New York, New Haven & Hartford Railroad that freight rates would be reduced, and that in the absence of such assurance it would not have been built. The carrier, it is claimed, has not only failed to reduce rates on the Mystic product, but has established a rate of \$2 per gross ton on competitive pig iron ex-barge from Albany and Beacon, N. Y., to New England points, which is lower than rates paid by the Everett company.

Furthermore, it is contended that these ex-barge rates are unduly preferential to the company's competitors located at Buffalo and other New York State points, giving Buffalo furnaces an additional competitive advantage of \$1.13 a ton. The New York, New Haven & Hartford Railroad's \$2 rate from Beacon, N. Y., blankets its system as far east as the Phillipsdale, R. I.-Worcester, Mass., line. The complainant maintains that carrier's pig iron rates are high as compared with those asked by the

New York Central Railroad, and makes the following comparisons:

		N. Y., N. H. & H. Rates		N. Y. C.	
		Boston		Beacon, N. Y.	
		Ton		Ton	
		Car	Mile	Car	Mile
40...	5.0c.	\$2.55	...	...	3.5c.
70...	3.5	1.79	2.81c.	\$1.43	2.0
100...	2.5	1.28	2.00	1.02	1.75
135...	2.4	1.22	1.48	.755	1.4
180...	1.95	1.00	1.11	.577	1.1
215...	1.7	.867	...	...	0.9

Freight rates on competitive irons, despite the \$2 water freight rate, are not against the Mystic Iron Works in all instances. To illustrate this point, the following rates per ton are given for comparison, those from New York State being figured on the \$2 water freight rate:

To:	From		
	Everett	Buffalo	Port Henry
Providence, R. I....	*\$2.00	\$3.78	\$3.65
New Britain, Conn..	*2.90	3.78	3.65
Springfield, Mass....	2.27	3.78	3.00
Worcester, Mass....	1.89	3.78	3.15
Hartford, Conn.....	*2.90	3.78	3.65
New Haven, Conn..	*3.20	3.78	3.28

*Plus a \$5 per car transfer charge.

Steel Roof Reduces Hazards in Washington Fire Test

In a recent fire test conducted in Washington by the United States Bureau of Standards to determine primarily the fire-resistant qualities of various types of steel safes, a collateral test was made of a steel roof as a means of reducing hazards due to flying embers and sparks. The old building used by the Bureau of Standards for the fire test was covered with a material of such composition that it would readily catch fire from the heat generated by the burning of dry lumber purposely piled on floors below. The bureau invited the Sheet Steel Trade Extension Committee to cooperate in the test by placing a steel roof over the old roof. Double standing seam galvanized steel roofing was used.

Following the test the Bureau of Standards made the following observations regarding the roof:

"The framing carrying the elevator penthouse at the front of the building fell at 22 min. after the fire was started, carrying a portion of the roof with it. Further collapse of roof supports in this part of the building occurred during the next 5 min., leaving the front part of the metal roof unsupported. By 28 min. portions of the front wall fell and between 36 and 39 min. there was a collapse of the upper portions of the side walls. This would, of course, remove all support for any roofing.

"However, particularly with masonry walled buildings, the danger from hot blasts and brands is largely over when this stage is reached. The period of protection by the metal roof during this particular fire extended up to 30 min. after the fire started, which represents a portion of the most intense period of the fire. The metal roof for the time undoubtedly

helped to prevent a chimney effect, compelling the flames and hot gases to escape mainly through the front and rear of the building."

John A. Pierpoint, former president National Association of Sheet Metal Contractors, who laid the steel roof and who closely observed the fire test, said that the sheet steel roof continued to wave up and down, even though it was red hot from the heat below, and at the same time prevented all burning embers from going above the line of the roof. "As a fire blanket or retardant," said Mr. Pierpoint, "I feel that the sheet steel roof was a complete success. The test shows that the double locked cross seams and standing grooved seam will hold together until the metal gets to near the melting point."

British Welding Associations Reorganize

As the result of mutual conferences between committees from the British Acetylene and Welding Association and the Institution of Welding Engineers a plan of cooperation has been agreed upon whereby the former will act as a trade association only. Its name will be changed to "The British Acetylene Association" and its members restricted to firms and individuals trading in oxygen, acetylene, calcium carbide, or oxwelding equipment. The Institution of Welding Engineers is to maintain separate existence, and confine its attention to scientific and technical problems and to the promotion of welding in all its branches. Its membership is to be confined to individuals.

United Steel Works Plans Large Expansion

HAMBURG, GERMANY, July 6.—The United Steel Works of Germany has just issued details of its expansion program, which will cost 200 million marks. Improvements are to include a large open-hearth steel plant at Dortmund, modernization of plants at Mühlheim and construction of a new electric steel plant. Production of hoops and bands will be substantially increased. Two new blast furnaces of large capacity will be built and three furnaces, which were built in 1904, will be scrapped.

New Production Counter

A new counter for production machines, designated the "productimeter," has been brought out by the Durant Mfg. Co., Milwaukee. It is said to be particularly adapted to small drill presses, light-duty conveyors, printing presses and the like.

Among the new features are special bronze bushings to insure long wear. These require little oil and when worn can be replaced with new bushings. There is a new drive sleeve designed to prevent racing of the counter when operated at high speed.

More Than 2,200,000 Automobiles in First Half

Production of automobiles in the United States in June is reported by the Department of Commerce at 396,714 units, making a total for the first half of 2,201,880. This is the second largest production for any six months in the history of the United States. It was exceeded only by the first half of 1926, in which the total was 2,358,585 cars and trucks. It exceeded by 2½ per cent the 2,150,134 of the first half of 1925 and by more than 6½ per cent the 2,068,915 of the first half of 1927. The largest second half yet reported was in 1925, when the total was 2,115,570. No other second half has reached 2,000,000 cars.

Of the June total, passenger cars represented 356,439 and trucks 40,275. In May the year's maximum was reached, at 375,863 passenger cars and 50,233 trucks—a total of 426,096. Compared with 1927, June shows a larger gain in passenger cars, but a falling off in truck production. Passenger cars a year ago numbered 278,729 and trucks 43,238.

Comparing the two types of output for the first half-year, passenger cars this year at 1,965,727 showed an increase of 9 per cent over last year's 1,802,620. As to trucks, however, the output of 236,153 units this year was 11½ per cent below the 266,354 produced last year.

Commercial Aviation in Germany and England

According to a report on civil aviation issued by the English Government, by far the largest development in air transport has occurred in Germany, where the Deutsche Luft Hansa has 170 machines, 150 pilots, and 56 air engineers in active service. It operates over 70 routes in the summer and about half this number in the winter, and provides communication with most European countries, either alone or in conjunction with other concerns. In 1927 it carried 151,091 passengers, the mileage flown being 6,189,000. Another German firm operated a service between Berlin and Moscow, where a connection was made with the Junkers' service to Teheran. This concern carried 3700 passengers. The haulage of freight is rapidly becoming an important factor in German air transport.

In Great Britain, Imperial Airways, Ltd., concentrated its attention on the London to Zurich, London to Cologne and the Southampton-Guernsey routes. The mileage flown was 614,655 miles, compared with 840,000 miles in the previous year, though the passengers carried increased from 16,775 in 4777 flights to 18,874 in 4450 flights. The cargo carried fell from 679 tons to 593 tons. The British share of the foreign traffic fell from 61 per cent to 57 per cent., the total passengers carried on the cross-Channel services being 28,764. Traffic fell off much less

during the winter months than during the previous year. This movement was assisted by the introduction of second-class fares. Efficiency is also increasing, the percentage completed of flights actually commenced being 99 per cent. The chief cause of interruption was bad weather. The regular air services were free from accident for three years.

The notable technical developments during 1927 have been, according to *Engineering*, the substitution of metal construction for that of wood and fabric, leading to greater safety, lower maintenance, and less weight. Much progress was made in the development of apparatus for controlling airplanes at low speeds, of which the most successful is that known as the automatic slot, and experiments were continued in connection with the silencing of aircraft and engines. The Napier-Lion water-cooled engine has proved successful. During the year 100-hp. De Havilland and the Avro "Alpha" engines were produced for use on light airplanes.

Continued Heavy Production of Steel Castings

Production of commercial steel castings in June is reported by the United States Department of Commerce at 90,202 net tons. While this is a reduction of 8 per cent from the 92,948 tons of May, it is the third largest monthly tonnage in more than a year. It compares with 87,767 tons in June, 1927, and represents 63 per cent of capacity compared with 64 per cent in May and 61 per cent a year ago. Of the June total, 30,742 tons was railroad specialties, representing 46 per cent of capacity for that type, while 59,460 tons or 77 per cent of capacity was miscellaneous castings.

Production for the first six months has reached 523,745 tons. This is 4½ per cent less than the 548,223 tons of last year. The reduction was felt by both groups, for railroad specialties at 204,841 tons were nearly 7 per cent below the 219,612 tons of last year, while miscellaneous castings at 318,904 tons recorded a drop of 3 per cent from the 328,611 tons of the first half of 1927.

New orders in June showed a sharp shrinkage from preceding months and represented the lowest total since last November. Bookings were only 70,762 tons, compared with 86,414 tons in May and with 90,898 tons in June, 1927. They represented 49 per cent of capacity against 60 per cent in May and 63 per cent a year ago. Railroad specialties recorded the greater portion of this drop. At 22,597 tons, or 34 per cent of capacity, they were 35 per cent lower than the May total of 34,995 tons, which was 52 per cent of capacity. They were still further below the figure of last year, when June showed 39,455 tons, or 59 per cent of capacity. Miscellaneous castings booked in June were 48,165 tons, or 63 per cent of capacity. This represents a drop of more than 6 per cent

from the 51,419 tons of May and about the same amount from the 51,445 tons of June, 1927.

New bookings in the first six months were 505,947 tons, or 59 per cent of capacity. This is about 6 per cent lower than the 537,189 tons of the first six months of last year. Railroad specialties recorded the larger drop in the six months, the total having been 203,766 tons, or more than 11 per cent below the 230,176 tons of last year. Miscellaneous castings at 302,181 tons were less than 2 per cent down from the 307,013 tons of last year.

Reduction in Wholesale Prices of Commodities

Further reduction is reported by the United States Bureau of Labor Statistics in the general average of wholesale prices. The figure for June is given as 97.6, compared with 98.6 in May, on the weighted average of 550 series of prices based on 100 as the average of 1926.

Several of the 10 major groups showed decreases of about 3 per cent each, these being farming products, hides and leather products, and the miscellaneous group. Decreases of less than 1 per cent each were recorded by foods, textiles, chemicals and drugs and housefurnishing goods. Increases of a fraction of 1 per cent were reported for fuel and lighting, metals and metal products and building materials.

Metals and metal products at 98.7 compared with 98.6 in May and with 98.2 a year ago. There was a decrease in iron and steel from 94.8 to 94.2, but non-ferrous metals went up from 92 to 92.8. An increase is reported in automobiles from 104.7 to 105.1, while agricultural implements and other metal products remained practically unchanged.

Foundry Equipment Orders 49 Per Cent Above Average

Orders in June for foundry equipment are reported by the Foundry Equipment Manufacturers Association at 149.1, the base of 100 being average monthly shipments for 1922 to 1924. While the orders represent a sharp reduction from the preceding month, they were, with that exception, the greatest since February, 1927. Orders in May at 335.6 were the greatest ever recorded.

Shipments in June were 129.4, on the same base as orders. Unfilled orders at the end of the month represented 359.3, on the same base. This is close to three times the current monthly shipments.

The Service Steel Co., seamless and welded steel tubing, Detroit, is installing an office and warehouse at 216 North Alameda Street, Los Angeles, to supply seamless steel tubing in low carbon steel and in popular aircraft grades.

Pittsburgh River Shipments of Steel Double Those of 1927

The Ohio River movement of iron and steel products from the Pittsburgh district was smaller in June, the Pittsburgh office of United States Engineers Corps reports. The total was 96,156 net tons, which compares with 112,818 tons in May, and 110,356 tons in April. Shipments by the Ohio River measure accurately the delivery of iron and steel products at destinations sufficiently distant from the Pittsburgh district to effect a substantial saving in freight charges over all rail rates. In June, the Allegheny River was used in the movement of 2350 net tons of iron and steel products and on the Monongahela River, 75,422 tons were carried.

Figures for all three streams include some interplant shipments, and some waterborne deliveries to Pittsburgh district consumers, but essentially the Ohio River tonnages represent the movement to more distant destinations. For the six months ended June 30, the Ohio River tonnage amounted to 554,660 tons, as compared with 223,736 tons in the same period in 1927.

Machinery Exports in 1927

Industrial machinery exports of 1927, by principal classes of equipment, were roughly as follows: mining, oil-well and pumping machinery, \$35,583,000; metal-working machinery, \$25,379,000; construction and conveying machinery, \$19,127,000; textile, sewing (industrial) and shoe machinery, \$17,552,851; power-generating machinery, except electric and automotive, \$17,551,000; other industrial machinery, \$67,975,000.

American Industries by Geographical Sections

Study of the manufacturing output of the United States by major types of products and by geographical sections has been made by N. E. Petersen, industrial statistician of the First National Bank of Boston. The study apparently was undertaken largely because of persistent reports of the gradual decadence of New England as a manufacturing center.

The articles, which were published serially in the Boston *Herald*, have been put out in pamphlet form by the bank. Each is illustrated by graphic representation of the various quantities involved and the story is told, in each, of the changing character of the manufacturing output of each section of the country. The value of New England production is shown to have gained five-fold in a period of 45 years.

In the Middle Atlantic States, iron and steel in 1925 represented 8 per cent of the total manufactured output, with women's clothing in second position. In the North Central States,

motor vehicles stand first, with iron and steel second, motor vehicle parts third, slaughtering and meat packing fourth, and foundry products fifth. In the East South Central States, iron and steel stand second, after lumber products. In the remaining sections of the country, however, it is a comparatively small factor. Smelting of copper leads in the Mountain States, while lumber products and petroleum refining are the two principal items on the Pacific Coast.

Exports Help Maintain High Automobile Production

Sales of American-made automobiles abroad have increased by 425 per cent during the last five years and a further important gain is taking place this year. As a result of this large expansion, foreign buying of motor cars now ranks third in the list of the country's exports, according to President J. R. Nutt, of the Union Trust Co., Cleveland.

"Expanding markets abroad offer the most favorable solution for the full employment of the country's growing automotive productive capacity," says Mr. Nutt. "Whether or not the saturation point is near in this country, there is a vast potential demand for cars among other peoples. Tariff barriers are directed especially against assembled cars, with the result that in 1928 probably over 200,000 cars made of American parts will be assembled in plants abroad. The rate of growth of motor car exports is seen in the fact that while five years ago exports totaled 78,000 units, in 1928 it is estimated that 450,000 cars and trucks will be shipped abroad.

"At the present capacity of the automobile industry, an output of approximately 4,000,000 cars annually is needed for reasonable prosperity. Replacement demand is about 2,500,000 cars annually in the United States and Canada. New buying this year is running at the rate of over 1,000,000 cars, so that the estimated exports of 450,000 will bring the total demand up to, or above, 4,000,000 cars."

Production in Italy

WASHINGTON, July 24.—Production of pig iron in Italy during the first three months of the current year totaled 83,800 metric tons as against 134,800 tons during the corresponding period of last year, while raw steel output showed a contrary course and increased to 404,400 tons as against 333,100 tons, according to a statement prepared by the Iron and Steel Division, Department of Commerce, based on reports received from Assistant Commercial Attaché A. A. Osborne, Rome.

Imports and exports declined during the 1928 quarter, being 197,400 tons and 2572 tons as against 237,672 tons and 4265 tons, respectively. Of the total of 104,928 tons of scrap imported into Italy in the first quarter

of the present year, as against 132,664 tons for the corresponding period of last year, France supplied 70,668 tons while 11,828 tons came from Switzerland. The United States supplied only 377 tons.

Electrical Developments Increase Use of Copper

Generation and use of electricity in the United States now utilizes approximately three billion pounds of copper, according to the Copper and Brass Research Association in its July bulletin. This total does not include the use of copper for telephone and telegraph lines and for electrical manufactures shipped abroad.

The association bases its estimate on the fact that for every horsepower added to the nation's electric power rating since 1922 the electrical industry has taken about 84 lb. of copper for the generation, transmission and use of current. Electric light and power plants, both steam and water-power, in the United States at the beginning of 1928 had a total generating capacity of about 34,000,000 hp.

Hydroelectric power alone may some day utilize nearly seven billion pounds of copper, according to the association. It is pointed out that the hydroelectric power industry, with almost 12,300,000 hp., now represents about 36 per cent of the nation's generating capacity and has therefore already become an important user of copper.

Activities in New England

The Standard Screw Co., Hartford, Conn., reports production and new orders during the first half of 1928 as well ahead of the same period last year, with the outlook for the remainder of 1928 highly favorable.

The Indian Motorcycle Co., Springfield, Mass., bookings and shipments in July will exceed those for the corresponding month last year. The company is developing a four-cylinder motor car with a 70-in. wheel base, similar to foreign types noted for economy of operation.

The Thompson Products, Inc., Hartford, Conn., plants are operating day and night. The company's automobile business is not only running at a new high record, but there has been a large growth in its airplane engine valve business this year, as well as in the valve replacement business. The company has written off \$250,000 of machinery, replaced by labor saving devices.

Average weekly earnings in representative New York State factories are reported for May by the State Industrial Commissioner at \$29.19. This represents a gain of 40c. over April, but it is 45c. lower than the earlier and is 11c. lower than the average in March. It is 1c. above the corresponding figure of a year earlier.

Warren Iron & Steel Co. to Be Sold at Auction

The entire assets of the Warren Iron & Steel Co., Warren, Ohio, manufacturer of alloy steels and agricultural implement disks, will be sold at public auction on Aug. 15, following order of the court and the bondholders' protective committee. The company has been employing about 1500 men, and sale will include land and buildings, rolling mills, fabricating equipment, and other machinery and equipment. The Industrial Plants Corporation, 25 Church Street, New York, is auctioneer.

New Distributing Company Organized

Taylor-Davis, Inc., 4250 Wissahickon Avenue, Philadelphia, has been formed by a consolidation of the A. Taylor Co. and the reinforcing bar division of Davis Brothers, Inc., both Philadelphia companies. The company will maintain a warehouse in Philadelphia and warehouse connections in Pittsburgh and New York as distributors for the Jones & Laughlin Steel Corporation's Junior beams and reinforcing steel, American Steel & Wire Co.'s welded fabric, Seneca Wire Mfg. Co.'s wire specialties and George W. Prentiss & Co.'s high carbon wire.

Officers of the new company are: Arthur P. Goldsmith, president; Edward L. Davis, treasurer; M. L. Fitzgerald, secretary. Herbert E. Calves is manager of reinforcing steel sales, Joseph H. Calby, manager of road reinforcing sales, and H. C. Ormerod, manager of wire and specialties sales.

Second Quarter Steel Earnings Up

The Republic Iron & Steel Co. reports net profits applicable to dividends in the second quarter of \$1,053,855, equivalent to \$1.03 a share on common stock. This is the first quarterly report to include the operating results of the Trumbull Steel Co., recently acquired by the Republic company. The showing of the quarter just passed is considerably better than net profits of \$487,332 reported in the quarter ended March 31 and also a slight improvement over the \$988,115 earned in the second quarter of 1927. Profits in the first half of 1927, however, amounting to \$2,032,537, were more than 30 per cent higher than the 1928 earnings for the corresponding period, totaling \$1,541,186. The company's unfilled orders, as of June 30, 1928, amounted to 324,315 tons, as compared with 170,671 tons on March 31.

The Central Alloy Steel Corporation's profits in the June quarter of this year totaled \$1,265,230, as compared with \$1,108,100 in the preceding quarter and with \$1,244,670 in the corresponding quarter of 1927. Profits of this company during the first six months of 1928 totaled \$2,373,330, as against \$1,929,573.

The Otis Steel Co. had earnings of \$907,436 in the second quarter of 1928, compared with \$821,288 in the preceding quarter and with \$435,512 in the June quarter last year. These figures are after depreciation, interest, etc., but before Federal taxes.

Earnings of the Gulf States Steel Co., at \$203,953 in the quarter ended June 30, 1928, showed a decline from the \$337,849 earned in the previous quarter, but an improvement over the \$134,130 reported in the second quarter last year. Profits in the first half of 1928 totaled \$541,802, as against \$371,225 in the first six months of 1927.

The A. M. Byers Co., net profits amounted to \$484,232 in the June, 1928, quarter; \$335,249 in the March, 1928, period; \$395,579 in the June, 1927, quarter, and \$374,092 in the three months ended March 31, 1927.

Sheet & Tube Company Dismantling Blast Furnaces

The Youngstown Sheet & Tube Co. has partially dismantled one of its blast furnaces at South Chicago, and will soon begin tearing down the Tod furnace of the Brier Hill group in Youngstown. As mentioned in THE IRON AGE last week the by-product coke works at Mayville, Wis., are to be scrapped, but it is not the company's intention to tear down the blast furnaces of the Mayville Iron Co. at that place. When these furnaces are operated coke will be secured from nearby producers.

This will leave the Sheet & Tube company with eight furnaces in the Youngstown district, four at the Campbell works, two at Hubbard and two at Brier Hill. In the Chicago district three furnaces will remain at the South Chicago Works and two at Indiana Harbor. With the two Mayville furnaces the company will have fifteen possibly active blast furnace units.

Dr. Hatfield to Be Next Campbell Lecturer

Dr. W. H. Hatfield, who is director of the Brown-Firth Research Laboratories, Sheffield, England, will deliver the Campbell memorial lecture during the annual convention of the American Society for Steel Treating to be held in Philadelphia the week of Oct. 8 concurrently with the National Metal Exposition. The subject of Dr. Hatfield's paper will be "The Application of Science to the Steel Industry." He will deal with such topics as steel making problems, manipulation and treatment, special steels, corrosion and acid resisting steels, effect of heat and heat resisting steels and tool steels and cutlery.

Dr. Hatfield is recognized as one of the world's leading metallurgists and has been actively engaged in the steel industry since his graduation from Sheffield University. He has presented over fifty papers before various technical societies as well as being the

author of several books on metallurgical subjects. He has been invited to lecture at a number of American institutions after the Philadelphia convention, among which are Yale University, Massachusetts Institute of Technology, Carnegie Institute of Technology, and the University of Michigan. Dr. Hatfield's lecture will be the third since the establishment of the Campbell Memorial Lecture by the A.S.S.T. in honor of its late founder member. The first lecture was presented by Dr. Guertler of Germany, the second by Dr. Jeffries.

Aberdeen Munitions Demonstration Oct. 4

The tenth annual meeting of the Army Ordnance Association will be held at the Aberdeen Proving Ground, Maryland, Thursday, Oct. 4. With the approval of the Secretary of War and the cooperation of the various branches of the Army, guests at the meeting are permitted to witness current tests of modern munitions. The American Society of Mechanical Engineers is cooperating this year.

The program of demonstrations, beginning at 10 a. m., lasts throughout the day and concludes with anti-aircraft firings in early evening.

September Machine-Shop Practice Meeting

The Machine Shop Practice Division of the American Society of Mechanical Engineers is to have its next national meeting in Cincinnati on Sept. 24, 25 and 26, and in connection with this meeting the Cincinnati committee is planning a trip to Ashland, Ky., to visit the new continuous sheet mill of the American Rolling Mill Co. The group will leave Cincinnati by river steamer on Monday afternoon, Sept. 24, and will arrive at Ashland Tuesday morning, where they will spend the day at the mill as guests of the company. They will leave Ashland some time Tuesday evening and be back in Cincinnati Wednesday morning. On Monday and Tuesday evenings there will be technical sessions aboard the steamer. A third session held in Cincinnati will be a symposium on machine tools.

The total cost of the trip including meals and state room will be about \$20. From the nature of the trip it will not be possible to include ladies, but there will be room for men guests who are not members of the society.

Navy Asks Bids for Steel

WASHINGTON, July 24.—The Bureau of Supplies and Accounts of the Navy Department will open bids on July 31 for approximately 200 tons of angles. On Aug. 7 the bureau will open bids for approximately 500 tons of galvanized sheets, 75 tons of black sheets and 50 tons of plates. The material is for various navy yards and air stations.

Reduction in Fabricated Steel Plate Orders

New orders for fabricated steel plate in June are reported by the Department of Commerce at 34,278 net tons, or 42.9 per cent of the capacity of the 51 firms reporting. This shows a drop of about 19 per cent below the 42,376 tons reported for May, but is 19 per cent above the orders for June, 1927, which were 28,811 tons. The recent total is the smallest, except for last November, since a year ago. For the half-year the total has been 259,448 tons, which is 2 per cent below last year's 264,945 tons.

Of the June total 11,280 tons (smallest since January) was for oil storage tanks; 2227 tons (larger than May, but otherwise smallest since December) for refinery materials and equipment; 965 tons (smallest, except February, since last July) for tank cars; 3225 tons (smallest since March) for gas holders; 778 tons for blast furnaces and 15,803 tons for stacks and miscellaneous. Compared with 1927, the half-year shows a gain of 2345 tons in orders for oil tanks and 2589 tons for refinery materials, but a decline of nearly 7500 tons on tank cars and 4550 tons on gas holders.

Makes Acid-Resisting Refractory Brick

A new refractory brick has been developed by the General Refractories Co., Philadelphia, which is highly resistant to acid attack. It has been given the name Acido. It is intended particularly for use in copper, zinc and lead plants, sulphide paper plants, fertilizer works, etc. It is made from a clay specially selected for acid resistance.

Safety Congress in New York in October

The National Safety Council is planning to hold its seventeenth annual safety Congress in New York from Oct. 1 to 5.

European Steel Entente Modifies Fines

WASHINGTON, July 24.—It has been officially confirmed that the Continental Steel Entente has modified its original system of fines for over-production so that now a fine of \$1 per metric ton will be levied upon each ton of raw steel produced in excess of the specified quota of each individual country up to a tonnage amounting to 7.5 per cent of the allotted quota, says a radiogram received by the Iron and Steel Division, Department of Commerce, from Acting Commercial Attaché Daniel J. Reagan, Paris. From 7.5 per cent up to 10 per cent this fine becomes \$2 per ton and for all tonnages produced in excess of 10 per cent above the

allotted quota, the old fine of \$4 is to remain in force. Should this revision be retroactive to Jan. 1, 1928, the fines assessed against the German industry will amount to \$4,000,000 over the first five months of the year, an amount three times that actually paid by this industry. This situation is compensated for, however, by an increase made in the German quota of from 275,000 tons to 300,000 tons monthly.

Malleable Castings Business Off in June

WASHINGTON, July 24.—Showing a decrease of 2321 tons, orders for malleable castings in June amounted to 52,108 tons, against 54,429 tons in May, according to reports received from 133 identical manufacturers by the Department of Commerce. Production in June totaled 61,230 tons, or 64.6 per cent of the reported monthly capacity of 94,719 tons, against 61,458 tons, or 67.3 per cent of the reported monthly capacity of 91,296 tons in May. Shipments in June totaled 59,482 tons, against 58,264 tons in May.

For the first six months orders totaled 328,938 tons, compared with 314,616 tons for the corresponding period last year. Production amounted to 356,753 tons and shipments to 339,558 tons, against production last year of 351,096 tons and shipments of 342,097 tons.

Report on Mechanization of Industry

Economic and social progress in connection with the mechanization of industry are covered in the twelfth annual report of Magnus Alexander, president National Industrial Conference Board, New York. This forms a volume of 60 pages, of which the topic mentioned covers 18 pages. Part II details the Conference Board's contribution during the year to industrial economic knowledge, along a wide variety of topics. Part III describes the board's organization and method of operation, while part IV lists the officers, members and counsellors and the affiliated organizations and committees.

Treasury Upholds Small Shapes Decision

The request of steel importers that the United States Treasury Department, customs division, reverse its decision of June 2, changing the classification of bar size channels, angles and tees from paragraph 312 covering structural material to paragraph 304, which relates to bars, has been declined by the department. It is expected that the importers will now appeal to the Customs Court of Appeals.

The decision pointed out, as reported in THE IRON AGE, June 21, page 1762, that investigation showed that angles, channels and tees in sizes

less than 3 in. are distinguished in the trade from the larger sizes of the said articles and that the smaller sizes are known as angle bars or angles, bar size; as channel bars or channels, bar size; and as tee bars or tees, bar size. Classified under the bar paragraph of the tariff act this material is subject to a duty of 0.3c. per lb. instead of 0.2c. per lb., the duty under paragraph 312.

The increased duty on much of the material affected by this reclassification, however, is more than 10c. per 100 lb. as a sizable tonnage of furring channels has been coming into the United States, and as these are valued at more than 1.50c. per lb. they are subject to a duty of 0.5c. per lb. or 50c. per 100 lb., whereas under the former classification in paragraph 312, there was no increase in the duty because of higher valuation.

Variable Conditions Noted in General Industry

Industrial activity, as measured by electrical consumption, is reported by *Electrical World* as indicating a spotty situation. Reports are based on returns from about 3000 large manufacturers scattered throughout the country. Industrial operations for the country are estimated for the first half year at about 2.8 per cent above that of a year ago. June showed a drop of 2.2 per cent from May, which is less reduction than usual. The month closed on a rate of operation about 3½ per cent above that of a year earlier.

Steel Earnings Show Improvement

The Jones & Laughlin Steel Corporation, with net profits of \$4,241,091 in the quarter just passed, made a better showing than in any three-month period since 1926. In the March, 1928, quarter the company's profits were \$2,903,457 and in the June, 1927, quarter, they were \$3,576,079. First half earnings this year were \$7,144,548, as compared with \$7,234,803 last year.

The Youngstown Sheet & Tube Co. also reports increased profits, the figure for the three months ended June 30 having been \$2,491,891, as against \$1,663,516 in the preceding quarter and \$2,062,215 in the June quarter last year. Sheet & Tube's first half profits totaled \$4,155,407 as compared with \$4,318,258 in the first six months of 1927.

Second quarter earnings of the Donner Steel Co., Inc., amounted to \$307,345 this year and to only \$161,472 in 1927. The company's net for the first half of 1928 totaled \$391,218, as against \$229,733 last year.

The Superior Steel Corporation showed a profit for the first time since 1926, its net amounting to \$30,760 in the June quarter. Net loss in the preceding quarter was \$63,117 and \$46,000 in the second quarter of 1927.

Reinforcing Steel

Illinois Road Work Will Take 2500 Tons—Awards 5400 Tons

WITH 2500 tons needed for road work in Illinois and 1000 tons for similar purposes in Arkansas, new projects reported in the last week will require about 5900 tons. The following awards, totaling about 5400 tons, include no sizable jobs except a municipal reservoir at Portsmouth, Ohio, taking 1000 tons:

WESTCHESTER, COUNTY, N. Y., 150 tons, road work, to Truscon Steel Co.
NEW YORK, 700 tons, section of subway; from Rodgers & Hagerty, Inc., general contractor, to Day & Goater, Inc.
MONMOUTH COUNTY, N. J., 100 tons, road work, to Truscon Steel Co.
PORTSMOUTH, OHIO, 1000 tons, municipal reservoir, to West Virginia Rail Co.
DALLAS, TEX., 100 tons, warehouse for Crane Co., to Laclede Steel Co.
SPRINGFIELD, ILL., 250 tons, Illinois Highway Commission road work, to Laclede Steel Co.
CHICAGO, 500 tons, plant building, Miehle Printing Press & Mfg. Co., to Joseph T. Ryerson & Son.
CHICAGO, 275 tons, building for B.-A. Eckhart Milling Co., to Barton Spider-Web System, Inc.
CHICAGO, 150 tons, apartment building, 5511 West Washington Boulevard, to Concrete Engineering Co.
MAYWOOD, ILL., 100 tons, two public schools, to Concrete Engineering Co.
ST. LOUIS, 300 tons, fruit commission house for Wabash Railway, to Laclede Steel Co.
ST. LOUIS, 450 tons; Mercantile building at Eighteenth Street and Washington Avenue, 350 tons, and factory building for Waxite Paper Co., Newstead and Hunt Avenues, 100 tons, to Missouri Rolling Mills Corporation.
CHICAGO, 100 tons, Forty-third Street

viaduct, to Jones & Laughlin Steel Corporation.

CHICAGO, 180 tons, public school, Morgan and 105th Streets, to Barton Spider-Web System, Inc.

SACRAMENTO, CAL., 400 tons, paving in Ventura County, to unnamed interest.

OAKLAND, CAL., 170 tons, school administration building, to Pacific Coast Steel Co.

OAKLAND, 100 tons, automobile building, Twenty-ninth Street and Broadway, to Gunn, Carle & Co.

LOS ANGELES, 250 tons, apartment building, Rossmore and Rosewood Streets, to unnamed interest.

OLYMPIA, WASH., 100 tons, highway work, to Northwest Steel Rolling Mills.

SEATTLE, 350 tons, hotel, Fifth Avenue and Virginia Street, to Northwest Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

PROVIDENCE, R. I., 500 tons, produce terminal for New York, New Haven & Hartford Railroad.

WHITE PLAINS, N. Y., 500 tons, high school; bids July 25.

PITTSBURGH, 150 tons, McSorley Garage, to Carlem Engineering Co.

CINCINNATI, 300 tons, Walnut Garage.

CHICAGO, 500 tons, caissons for Mercantile Mart; general contract placed with John Griffiths & Son Co.

LITTLE ROCK, ARK., 750 to 1000 tons, road work for Arkansas Highway Commission.

SPRINGFIELD, ILL., 2500 tons, road work for Illinois Highway Commission.

SAN FRANCISCO, 114 tons, bakery, Alameda and Bryant Streets; bids being taken.

EVERETT, WASH., 300 tons, Rambaugh store; bids being taken.

Data Sheets for Motor-Truck Fleet Operators

To afford motor vehicle fleet operators a means for quickly checking changes made by manufacturers in the models of vehicles they operate, and for correctly ordering replacement parts, a standardized mechanical data sheet is proposed by J. F. Winchester of the Society of Automotive Engineers. This sheet lists all parts of the chassis, the body, and the equipment, and provides spaces for filling in such data regarding them as make, model, type, part number, serial number, size and the like.

Widespread use of this standardized sheet by leading motor truck and motor coach manufacturers, and the distribution of the data among service stations and fleet operators, would be an important factor in the more economical operation of such vehicles, by eliminating unnecessary delays for parts replacements and assuring more constant service from the vehicles. The proposed data-sheet form was printed in the July issue of *S.A.E. Journal*.

Adoption of such a form would involve practically no expense for any individual, according to Mr. Winchester. If the manufacturer adopts it in the right spirit, it can be used as a final inspection sheet and factory record, and can be coordinated with the factory instruction book supplied with the vehicle. This would simplify ordering of parts after a vehicle has become several years old, and would provide reliable reference records for the organization in furnishing parts for any model.

Railroads Cut Operating Expenses

Passenger business on the railroads in the first half of 1928 was the smallest in 18 years, according to *Railway Age*. Freight business was the smallest since 1925. In consequence, total earnings were the smallest since 1925.

The average wage paid per employee was the largest since 1921. In spite of this, total operating expenses were the smallest since 1922. There are numerous reasons why operating

expenses were the smallest in six years. An important one is the decline in traffic. To this has been partly due the reduction in employees to the smallest number since 1922. This reduction more than offset the effect of the advance in the average wage, and, in consequence, the total amount of wages paid was the smallest since 1922.

Economy of operation has been increased in many ways, in spite of improvements which have been effected in service. The average number of tons of freight loaded in each car was the smallest since before the war. Nevertheless, the amount of service rendered hourly by the average freight train was the greatest in history. This was because the number of cars handled in the average freight train was the largest ever reached and the average speed with which freight trains were moved was the greatest ever recorded.

Poland Importing British Scrap

LONDON, ENGLAND, July 13.—Britain's maintenance of an export trade with Poland in iron and steel scrap for remelting is one of the outstanding features of the scrap market. During recent months substantial quantities have been sent from Yorkshire, and the significance of the movement is reflected in the course of prices whenever there is a fair domestic demand. One reason given for Poland's scrap purchases is that the practical side of the rehabilitated steel industry of that country is largely in the hands of men trained in British steelworks. A large contingent of Sheffield steel smelters is there. According to scrap merchants, the material they sell is now used in the big open-hearth plants, 60 per cent, and even more, in some cases, being the proportion of the charge of a 60-ton furnace.

Less Shipping Under Construction

Total merchant shipping being constructed throughout the world represents 2,660,462 gross register tons, according to a statement of Lloyd's Register of Shipping. This is a reduction of 8 per cent from the March 31 figure of 2,893,251 tons. The reduction was accounted for by a shrinkage of 238,000 tons in British yards. The United States showed only 55,502 tons on June 30, compared with 56,049 tons three months earlier.

New York and Texas accounted for practically 30 per cent of the exports of the United States in 1927, according to the Department of Commerce. Totals were \$770 and \$647 millions for the two States, and \$4,759 millions for the nation. The figures relate, as nearly as may be, to origin of the goods and not merely to exporting points.

Fabricated Structural Steel

New York Newspaper Building Takes 13,000 Tons—Awards Total 33,000 Tons

AWARDS during the last week amounted to 33,000 tons, but included no outstanding jobs except a building in New York for the *Daily News*, requiring 13,000 tons. Among the new projects, totaling 28,300 tons, are 7000 tons for junior high schools at Chicago, 5000 tons for 12 oil storage tanks in Texas and 4500 tons for a college building at Pittsburgh. Awards follow:

PORTLAND, ME., 780 tons, theater and office building, to Lehigh Structural Steel Co.
NORTHFIELD, VT., 250 tons, Norwich University armory, to McClintic-Marshall Co.

LAWRENCE, MASS., 150 tons, Champion International Co. power house, to New England Structural Co.

WHYMOUTH, MASS., 750 tons, power house addition, to New England Structural Co.
NEW YORK, 13,000 tons, *Daily News* Building on East Forty-second Street, to Harris Structural Steel Co.

NEW YORK, 6000 tons, several apartment buildings for Julius Tishman & Sons, Inc., to Hay Foundry & Iron Works.

NEW YORK, 1200 tons, office building for Lee, Higginson & Co., at 49 Broad Street, to Taylor-Fichter Steel Construction Co.

BROOKLYN, 700 tons, addition to department store of Thalheimer Brothers, to Richmond Structural Steel Co.

WALKES-BARRE, PA., 1000 tons, building for Wilkes-Barre Savings Bank, to Anthracite Bridge Co.

NEW YORK CENTRAL RAILROAD, 300 tons, bridge at South Bend, Ind., to McClintic-Marshall Co.

PENNSYLVANIA RAILROAD, 200 tons, three plate girder spans in Indiana, to American Bridge Co.

CLEVELAND, 650 tons; 500 tons for extension to soaking pit building and 150 tons for shear building for Otis Steel Co., to Wellman-Seaver-Morgan Co.

HOCKING VALLEY RAILROAD, 450 tons, bridges in Ohio, to American Bridge Co.

ASHLAND, KY., 275 tons, warehouse for American Rolling Mill Co., to Jones & Laughlin Steel Corporation.

TUSCALOOSA, ALA., 510 tons, power house for Gulf States Paper Corporation, to Ingalls Iron Works Co.

NEW ORLEANS, 236 tons, two barges for United States Engineers Corps, to Howard Shipyard & Dry Dock Co., Jeffersonville, Ind.

WATSEKA, ILL., 200 tons, bridge span for Chicago & Eastern Illinois, to American Bridge Co.

OGLESBY, ILL., 300 tons, waste heat house for Marquette Portland Cement Co., to Worden-Allen Co.

CHICAGO HEIGHTS, ILL., 300 tons, mill building for Calumet Steel Co., to Worden-Allen Co.

BURR OAK, ILL., 418 tons, car repair shop for Chicago, Rock Island & Pacific, to American Bridge Co.

ROCK COUNTY, WIS., 300 tons, State bridge, to Continental Bridge Co.

KOHLER, WIS., 200 tons, supplementing 500 tons, pottery kiln for Kohler Co., to Worden-Allen Co.

MILWAUKEE, 2500 tons, addition to welded pipe shop of A. O. Smith Corporation, to Wisconsin Bridge & Iron Co.

WAUKESHA, WIS., 300 tons, addition for Waukesha Motor Co., to Wisconsin Bridge & Iron Co.

ST. LOUIS, 350 tons, fruit commission house for Wabash Railway, to Mississippi Valley Structural Steel Co.

OMAHA, NEB., 700 tons, addition to Union Pacific building, to American Bridge Co.

TACOMA, WASH., 400 tons, addition to

salt and chemical works, to Star Iron & Steel Co.

OAKLAND, CAL., 170 tons, bridge over Alameda Creek, to Herrick Iron Works.

OAKLAND, 180 tons, automobile building, Twenty-ninth Street and Broadway, to California Steel Co.

SAN DIEGO, CAL., 253 tons, bridge over Sweetwater River, to Robert T. Dawson, San Diego.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PROVIDENCE, R. I., 500 tons, produce terminal.

BOSTON, 200 tons, Simmons College administration building.

BOSTON, 150 tons, Lafayette Theater on Tremont Street.

NEW YORK, 2500 tons, Seward Park High School on Ludlow Street.

KEARNY, N. J., 700 tons, factory building for Western Electric Co., Inc.

STATE OF NEW JERSEY, 250 tons, highway bridge.

PHILADELPHIA, 590 tons, highway bridges for city; Sixth Street and Alleghany

Avenue, 375 tons; Ashdale Street, 100 tons; Leverington Avenue, 115 tons, bids opened July 25.

PENNSYLVANIA RAILROAD, 200 tons, bridges.

BALTIMORE, 500 tons, highway bridge for Maryland State Highway Department.

PITTSBURGH, 4500 tons, Cathedral of Learning, University of Pittsburgh.

ALTOONA, PA., 1000 tons, high school; bids taken.

DETROIT, 150 tons, plant addition for Thompson Products, Inc.

CLEVELAND, 150 tons, plant addition for Eaton Axle & Spring Co.

CLEVELAND, 130 tons, plant addition for Willard Storage Battery Co.

NEWARK, OHIO, 150 tons, Pennsylvania freight station.

STATE OF TEXAS, 5000 tons, 12 80,000-bbl. oil storage tanks for Texas & Pacific Oil Co.

STATE OF LOUISIANA, 2815 tons, two bridges.

MARSEILLES, ILL., 600 tons, highway bridges.

CHICAGO, 7000 tons, junior high school buildings.

EDGERTON, WIS., 150 tons, Newville bridge over Rock River; general contract let to P. J. Dunlap, Mount Horeb, Wis.

GREAT FALLS, MONT., 450 tons, high school building.

OAKLAND, CAL., 250 tons, hangar No. 4 for Port Commission; bids taken July 23.

GLENDAL, CAL., 400 tons, bridge over Los Angeles River; bids soon by Pacific Electric Railway Co.

OLYMPIA, WASH., 119 tons, bridge over Cle Elum River; general contract awarded to R. A. Geary, Yakima, Wash.

Plant Operation Averages 96 Per Cent of Full Time

Part-time operation of manufacturing plants has been studied by the National Industrial Conference Board, New York. The latest figures are for May, but as the change has been slight over the past 18 or 20 months they may be substantially accurate today. At that time about 78 per cent of the plants were operating on full time and 21 per cent on part time, the remainder being idle. Average operation of the part-time plants was at 81 per cent of full time, indicating that many of this group of plants must have been shut down more than one day each week. Percentage of full-time operation, averaged for all plants, was 96.

July Automobile Sales Unusually Large

Retail buying of automobiles holds at a point very considerably above the normal movement for this season, according to *Automotive Industries*, and gives indication of making the present summer the most active in recent years. Though the new cars are the center of interest, there continues to be good selling in earlier cars. Low-priced cars in particular show only seasonal reduction from earlier in the year.

Maintenance of price as reflected in the new car offerings gives indication

of the strength of car demand, and the intention of manufacturers to base sales effort upon improvements and refinements. Some of the largest gains in the first half of the year were scored by companies whose cars were priced to permit including special engineering and refinement features.

July output of United States factories will be considerably under the June total of 396,714, not so much because of let-up in sales as to allow inventory at many leading factories. This will aid further in bringing dealer stocks, already at a low seasonal level, to a point warranting extensive manufacturing operations through the rest of the summer.

Fewer Cars in Need of Repair

Freight cars in need of repair on July 1 totaled 145,210, or 6.5 per cent of the number on line, according to reports just filed by the carriers with the Car Service Division of the American Railway Association. This was a decrease of 2780 under the number reported on June 15, at which time there were 147,990, or 6.6 per cent.

Freight cars in need of heavy repairs on July 1 totaled 107,265, or 4.8 per cent, a decrease of 183 compared with June 15, while freight cars in need of light repairs totaled 37,945, or 1.7 per cent, a decrease of 2597 compared with June 15.

ESTABLISHED 1855

Selling Copper in Europe

OUR British contemporaries have been having a good deal to say about what they consider to be a control of copper by the American Export Association that is unfavorable to the British manufacturers. Yet all that the American producers have done—and in this they have had the cooperation of the principal foreign producers—is to focus the copper market in New York and eradicate some trade evils, especially outside speculation.

The objectives have been to establish direct distribution of copper from producers to consumers, to eliminate speculative intermediation, and to extinguish competition among the producers in the foreign trade. The existence of large stocks of crude copper in Great Britain was formerly the basis for active trading on the London Metal Exchange and a speculative market was created that had its repercussions, commonly disliked, upon New York. American refiners have absorbed nearly all of that copper during the last year or two, fetching it hither for refining (copper refining in Great Britain having become a lost art). Consequently there is no respectable basis for buying and selling warrants in London and quotations from its exchange have ceased to be of influence.

In Europe the copper business has now been put upon the same terms as have prevailed for decades in the United States, i. e., a direct distribution from producers to consumers, with exclusion of the group of middlemen who formerly got their living out of the industry. The excluded group is naturally resentful, just as once it was in New York, and some consumers are doubtless vexed over the curtailment of their ability to play the market, which they ought not to want to do, anyway. Their complaint of being rationed in their supplies is obviously frivolous, for of course producers want to sell all the copper they can. Naturally there may be bilateral ideas as to price.

It is a soundly economic situation, even if it be not of the nature of *laissez faire*; and it cannot be otherwise, lest producers at least would become involved in difficulties such as resulted from the Secretan corner and the Amalgamated umbrella, which are still vividly remembered, although they happened long ago. During the last two years the world's consumption of copper has been increasing and in consequence there has been this year a very moderate increase of price. The situation and the prospects are kept constantly illuminated by the admirable statistics that are available.

The price of copper in Europe is the New York price plus freight and expenses. There is occasionally a slight differential in the published quotations that is misunderstood abroad. In periods of slack buying those smelters who take in ore on quotations may have to

shade the price in the domestic market in order to dispose of the supplies they are constrained to accept, while the producers from their own mines continue to hold at a previous price, biding the time of advent of customers. In such a situation the Export Association now presents a united front. Although the shaded price is then a true market quotation, it is not a discrimination against the European buyer, for if the latter wanted copper in any quantity there would not be any shaded price. Likewise as to American buyers in the aggregate.

Two Superstitions Ruined

BANG! Bang! There go two pet beliefs, all in one day, ruthlessly slain by cold-blooded scientists. The remains will be regretfully interred alongside all that is mortal of such other defunct items as beta iron, solid atoms and a pancake-like earth.

We had always thought that type metal was type metal principally because it expanded on solidification and hence filled the mold sharply. But some Japanese with an iconoclastic bent has actually measured the volume of several alloys which printers use, and he finds that they contract during freezing!

Another statement, made by some forgotten writer, has been repeated so often that it is almost heresy to question it; namely, that the temperature of the oxy-acetylene flame is 6300 degrees Fahrenheit. This "fact" and the melting points of the common metals are always placed before welders as essential scientific data for the workman. Now some inquiring German expert in optical pyrometry announces that the maximum temperature he was able to measure was 3100 degrees Centigrade.

"What's a few hundred degrees, more or less, among fiends?" one might ask, without receiving any answer other than that it is well that an attempt has been made to measure the temperature with scientific equipment. The 6300 figure probably came from a class-room exercise in metallurgical calculations: given the specific heats, the heats of formation, and the chemical equation, to calculate the maximum flame temperature. The obvious error in such computations is the implicit assumption that data collected at moderate temperatures remain correct at intensely high heats.

That type-metal matter is not so simple. Gulliver's "Metallic Alloys," a standard text, says "Lead-antimony alloys are used in type metal, an alloy which . . . should expand on solidifying so as to take the finest design on the mold." Other books on metals and alloys make similar statements. Vickers in his "Metals and Their Alloys" apparently comes nearer the facts when he says: "Lead-antimony alloys containing less than 22 per cent of antimony contract on cooling; only richer

mixtures reproduce the finest impressions of the mold." He then quotes a number of standard type-metal compositions. The highest contains 18 per cent antimony. Looking back in a curious book dated 1869 and entitled "The Useful Metals" we find that bismuth (a metal which undoubtedly expands on solidification) was then used as a constituent of "letter type." Stereotype metal of that day was said to be composed of "3 lead, 2 tin, and 5 bismuth," but the various type metals quoted range from 9 lead 1 antimony to 3 lead 1 antimony.

Perhaps the statement that type metals expand on cooling is a relic of bygone days when some bismuth or high-antimony alloys were used which really did expand slightly on freezing. At any rate it is one of those statements which have been repeated, uncritically, because some former authority said so and so, and despite the fact that passing years may have entirely altered the circumstances for which the original statement was true.

Strip and Sheet Competition

A YEAR and a half back the sheet mills were a good deal concerned over the prospect of competition by strip mills. The sheet mills feared that large inroads upon their trade would be attempted. Apparently they had greater expectations than strip producers themselves as to what could be accomplished within a short time in the manufacture of a large tonnage of wide strips of relatively light gages. At any rate there has not been anything like as large increase as was expected. Comparing 1926 and 1927 there was a decrease of only 258,442 tons in sheet production, with an increase of 96,330 tons in strip production, a net change of 354,772 tons, which was only 6.5 per cent of the combined sheet and strip production of 1926, 5,459,568 tons. (Sheets 4,237,479 tons, strips 1,222,089 tons).

It would not be safe, moreover, to assume that this change involved a swing by consumers adopting strips in place of sheets for identical use, for when we compare 1925 and 1927 we find only 117,795 tons decrease in sheets and 69,784 tons increase in strips, the change of 187,579 tons being but 3.5 per cent of the combined production, certainly a small swing in two years. Also we have the fact that in the first half of this year independent sheet mills reported 10 per cent greater production than in the first half of last year.

It was feared that strips would be competitive in the market with sheets over quite a range of gages and widths. Such a situation has not developed. Prices show that the strip market has more competition within itself than it has with the sheet market, for a large tonnage of strips is being sold at prices far below figures that sheet mills would think of naming.

It is simply a case of the products being quite different. There is not anything like the similarity between them that many sheet mills feared a year and a half ago would develop before the present time. But that is not strange. Strips are wide hoops. Bands (12 gage and heavier) and hoops (13 gage and lighter) were produced in large quantity long before the word "strip" entered into trade usage. But there is no official definition indicating where bands and hoops stop and strips begin.

It will help one to get his bearings to refer to the production statistics of 1905, when after a lapse of years sheet production statistics were gathered, though only

of 13 gage and lighter. Such production was 1,491,024 tons, while in the same year, 1905, production of bands and hoops was 445,527 tons, or about 30 per cent as much. Last year band, hoop and strip production was 33 per cent as large as total sheet production, all gages. Tin mill product of course is not reckoned. The various commodities are developing largely along their own lines. The contact in competition is relatively small.

Exit the Jacksonville Scale

TECHNICALLY the bituminous coal miners who belong to the United Mine Workers had been on strike for several years owing to the refusal of mine operators to pay a wage of \$7.50 per day, the Jacksonville scale. Practically most persons had forgotten that there was a strike. For a long time mines that do not recognize any union have been producing all the coal that is needful through the labor of non-union miners and such members of the United Mine Workers as surreptitiously went to work. The fictions of the strike and the Jacksonville scale were maintained by the union officials in order to preserve a semblance of organization and authority, also payment of members' dues.

Last week John L. Lewis and his assisting committee abandoned the Jacksonville scale and authorized negotiations for district wage scale to be based on existing wages. This is a recognition that the market price must prevail in labor as well as in commodities. It is pitiful that Mr. Lewis so long deluded his followers into the belief that anything else could happen.

When labor unions come into conflict with economic law operating in freedom they are defeated every time. The recent collision must have been as disastrous to the United Mine Workers as was the recent general strike of labor unions in Great Britain. Probably it will cease to be a power in the bituminous coal fields. For a labor union to be successfully dictatorial it must be protected by restrictive legislation, as are the anthracite miners of Pennsylvania, or by restrictive membership (together with blackjacks and boycotts), as are the artisans of our seaboard, and some interior, cities. Why a long suffering public permits their strangling methods is one of the mysteries that has not been fathomed.

The Unemployment Issue

AS was to be expected, unemployment statistics are being given even more of a partisan twist as the lines of the Presidential contest are being drawn. Secretary Davis, in a report of March 24, this year, to the United States Senate, estimated that 1,874,050 persons were unemployed in the United States, taking as his basis a shrinkage of 753,107 between 1925 and 1928 in manufacturing and Class I railroad labor, or 7.43 per cent in those groups. Then he applied the same percentage to the total of 25,000,000 persons who were working for wages or salaries in 1925.

Probably the Secretary erred on the favorable side, in view of the heavy percentage of idleness in coal mining, with no conspicuous compensating increase. But certainly there will be distrust of an estimate of upward of 5,000,000 made in connection with a political attack on Secretary Davis's figure, and a large measure of reserve in respect to the figure of 4,000,000 put out

in February on behalf of the Labor Bureau, Inc., even after allowance for the seasonal increase in following months. The main fault is to be found with all high appraisals of idleness in industry in their assumption that persons who have left employment in a given line have taken up work in no other.

That, as we have pointed out heretofore, is also the weak point in many attempts to appraise the economic effect of the recent more rapid displacement of men by machines, as well as of that "new thought" in production engineering that has been so effectively at work since the depression of 1921.

Already in campaign discussion the question has been asked, what does this party or that party propose to do about unemployment. It seems to matter nothing that the issue is non-political and economic, just as the problem of a better living for the farmer is economic. There is ahead of us—more's the pity—a season in which the facts concerning momentous changes in industry are to be wrested for partisan advantage and in which appeals to prejudice will take the place of honest effort to meet new situations with new measures. Labor will be assured by political orators that much of the existing unemployment can be cured by legislation, whereas in fact the adjustments that must be made will require time and cannot be hurried by legislative make-shifts.

It could well be wished that the labor unions themselves would sense the opportunity of the present situation in industry. The millions the United Mine Workers have spent in a hopeless warfare to set aside economic law would have gone far toward solving the problem of relocating thousands of men who will never again get a livelihood from the mining of bituminous coal.

Good Showing by Structural Steel

PORTLAND cement is showing smaller gains in movement than formerly. Last year's increase in shipments was 6 per cent, while in the first half of this year there was a loss of 1 per cent from the first half of last year. Fabricated structural steel on the other hand has shown a sharp gain this year.

In this department of THE IRON AGE of Jan. 26, 1928, a 15-year comparison was made between fabricated structural steel and Portland cement. In 1913 the showing was 70.3 barrels of cement to one net ton of fabricated structural steel and in 1914 it was 68.2 barrels, while in the last five years, 1923-7, there was an average of 60 barrels. For the first half of this year the relationship was 50.8 barrels. Yet in the period covered by the comparison there developed a very large use of cement for road construction, which would help consumption of other forms of steel, chiefly in reinforcements. The fears of long ago that concrete would tend to supplant fabricated structural steel, or at least provide a very active competitor, have proved to be much exaggerated.

Fabricated structural steel has also gained in proportion to total steel made. In 1913-4-5 it averaged 102 pounds per gross ton of all steel ingots produced. In the first six months of this year the proportion was 116 pounds.

A few weeks ago we made reference to this being an active presidential year, citing steel production, freight car loadings, Portland cement and building contracts as evidence that this had been in no sense an

"off" year to date. Now the fabricated structural steel statistics for the half year have become available, and they make a particularly favorable showing, just the sort needed to oppose the notion that politics tend to curtail trade and particularly the inception of long term investments.

Fabricated structural steel lettings in the first half of this year, computed by the Department of Commerce on the basis of actual returns from more than 80 per cent of the industry, were 1,586,250 net tons. Previously the best first half had been 1926, with 1,432,800 tons, and thus the record was passed by 10.7 per cent and the first half of 1927 by 13.7 per cent.

Another new record has been made. The second half of last year was the best second half. Twelve-month totals of lettings, through June 30, have been as follows: 1926, 3,035,940 tons; 1927, 2,853,000 tons; 1928, 3,254,750 tons. Shipments of the fabricating shops are reported separately, and are given at 3,008,000 tons in the 12 months through June 30. Subtracting this from bookings reported for the same period, it appears that the shops had 246,750 tons more business on books July 1 than on that date last year. Thus the steel industry has quite a backlog of business in that line of consumption.

Correspondence

Are Lower or Higher Iron and Steel Outputs Just Ahead?

To the Editor:—Ordinarily there is little to be gained by restating one's position, but the article by Mr. Thum in your July 12 issue is so clear and fair that it does seem worth while pointing out just how widely we differ.

We both agree, of course, in admitting that the world met with unexpected disaster in 1914, and that that calamity of itself accounts for a good deal of industrial irregularity. We agree that from an extreme low point in 1921 the world output of iron has risen to a high in 1927-28. We differ sharply as to what all this means, so far as the probabilities of the future are concerned.

Mr. Thum looks upon the 1921-28 rise as the beginning of a new cycle of progress; and feels that the World War simply caused a drag of twelve years in the normal industrial growth. If we accept his theory, we should look for new high records in world iron output in the years immediately to come.

I, on the contrary, feel that the World War came just at a time to accentuate a change in trend which was already visible; and that the rise of 1921-28 is merely a natural temporary recovery from sheer collapse. If I am right, we will not have to wait longer than 1929 or 1930 to see new low world iron records made—low, that is, for a number of years past. They may not reach the depths of 1921, but they may easily be closer to those than to the 1927-28 altitudes.

The two thoroughly ominous factors which will precipitate the next depression are in clear sight today; but, of course, no one can say which will act first. We have obviously a dangerous speculative position in America primarily. Security prices parted company with realities two years ago, and the final correction, however long delayed, is inevitable and may be spectacular. But we have also a far more serious factor which may bring about European trade collapse even before our own local conditions turn bad. I refer, of course, to the German reparations payments—or, rather, to the apparent impossibility of their being made.

EDWIN C. ECKEL.

Washington, July 19.

This Issue in Brief

In blast furnace operation, heavy white fog or smoke rising from slag runner indicates satisfactory reduction of sulphur. This condition is noticed when slag is highly saturated with calcium sulphide, in which form sulphur is removed.—Page 203.

* * *

Sheet steel roof proves excellent fire retardant. In test conducted by Bureau of Standards, galvanized steel roof with double locked cross seams and standing grooved seam held tight, even though red hot, preventing spread of flying embers and sparks, and eliminating "chimney effect."—Page 225.

* * *

In producing electric energy, fuel cost rises almost in proportion to output. Turbine room costs go up very slowly, and cost of steam exclusive of fuel not much more rapidly.—Page 205.

* * *

Statistics concerning only your own business are not sufficient. You must know not only what your own firm is doing, but must compare your company's performance with the industry as a whole, says Census Bureau official, in telling how business statistics should be used.—Page 204.

* * *

Recommends hot salt baths as a means of avoiding quenching cracks. Sorbitic structures can be obtained by quenching in melted salt at about 500 deg. C., giving physical properties "not inferior to those after water quenching and tempering," says Japanese metallurgist.—Page 210.

* * *

New low world iron output record, for recent years, is prophesied. E. C. Eckel says that ominous factors which will precipitate the next depression, as early as 1929 or 1930, are in clear sight today.—Page 234.

Sailor-welders are saving Government hundreds of thousands of dollars, says engineer. Every battleship has its own portable welding equipment, with competent welders among enlisted personnel.—Page 202.

* * *

Cuts costs by two-floor assembly system. First floor of motor truck plant is used for sub-assemblies, which are hoisted through hatchways and dropped on truck frames. Materials are received on first floor almost directly under the place where they will be required on second floor main assembly lines.—Page 206.

* * *

Fabricated structural steel is gaining over concrete. Production of Portland cement for first half of year was one per cent below same period of last year, while fabricated steel gained sharply. In the last five years, 1923 to 1927, ratio of output was 60 bbl. of cement to one net ton of fabricated structural steel. The ratio for first half of 1928 was 50.8 to 1.—Page 234.

* * *

Annealing furnace fired from top provides uniform temperature. Gas passes into furnace chamber through a series of ports located below and in line with a series of cast iron saddles on manifold. Flame is projected vertically downward. Close control has reduced the time of the cycle.—Page 212.

* * *

Solves moving assembly problem by installing chain conveyor which turns a corner. Otherwise, automobile engine builder would have had to use two conveyors, with the attendant expense of transferring engines from one conveyor to the other. The conveyor makes a 112-deg. turn.—Page 213.

Future of American manganese industry depends on solving the problem of using low-grade ores, Bureau of Mines official declares. Production of manganese ore in this country, he says, is rapidly approaching a point where materially higher prices will not, relatively speaking, increase production.—Page 214.

* * *

Steel is displacing concrete for automatic substation and switch-house use. Steel housings containing completely assembled electrical equipment are placed where wanted. Steel housings cost less than concrete, are more easily and quickly erected, and are safer. Sheet steel is also replacing marble and slate for switchboard use.—Page 215.

* * *

Automotive output for first half of year approaches record. Production totaled 2,201,880 cars and trucks, which was 6½ per cent below the record of 2,358,585 units established in first half of 1926, but above every other half-year.—Page 226.

* * *

Healthy demand for machine tools reflects good business in metal trades. Even with subnormal buying in the two most important fields, railroad and automotive, machine tool purchases are holding at a high rate.—Page 258.

* * *

Wholesale average commodity price falls. June index figure was 97.6, compared with 98.6 in May, with 1926 average as 100.—Page 226.

* * *

See coal union's defeat in withdrawing demand for Jacksonville wage scale. Operators do not seem anxious to resume negotiations, as many mines are operating under open-shop conditions.—Page 224.

Iron and Steel Markets

July Improvement Maintained

Output Increased Slightly But New Orders Grow Individually
Smaller and Outlook Is Dimmed by
Buying Conservatism

STEEL making has stepped up slightly from a little under 75 per cent of capacity a week ago to a full 75 per cent rate. Against this, new business and fresh specifications on contracts fell off in the week, and orders appear to be growing individually smaller. The increasing conservatism in buying thus indicated makes it difficult to forecast more than a week or two. Yet none of the important channels of steel outlet has narrowed to any definite degree.

From the railroads there has been a normal steady consumption of bars, plates and shapes; but, if anything, improvement is looked for from this quarter in view of better earnings of important lines and good crop prospects. However, car buying, not now in evidence, would not immediately increase steel rollings, even if it were on a large scale, because of the time element in assembling car specialties prior to getting under production. Freight car shops are fast reaching the point where shutdowns are imminent.

The automotive and farm implement industries show little, if any, recession. The seasonal lull which has overtaken some automobile builders seems to be offset by greater activity of those bringing out new models. Output of the first half of the year, 2,201,880 passenger cars and trucks, was exceeded only by the production of the first half of 1926.

Further large line-pipe requirements are promised in plans of the Sinclair Pipe Line Co. to supply Chicago from the Southwest, taking 8 and 12-in. pipe, and in a line, which may come earlier, from Louisiana to Kansas City. One of the largest inquiries for oil storage tanks in some time, for 12 tanks in western Texas, will take 5000 tons of plates.

A firmer price stand is being taken by producers, with the result that more sales at the level being sought for the current quarter on the heavy tonnage products, 1.90c., Pittsburgh, have come to light. The 1.85c. base still obtains in cases on steel bars and is fairly common on plates.

Strip steel remains weak, and neither this form of steel nor cold finished bars are moving as freely as last month. Compared with other years at this season the showing remains favorable.

Tin plate contract releases have been sufficient to keep the American Sheet & Tin Plate Co. at a 90 per cent of capacity output through September.

Manufacturers of electric refrigerators and stoves have helped bring an upswing in sheet mill production. Prices appear less irregular, with efforts to hold a minimum of 3.40c., Pittsburgh, or 3.45c., Valley, for galvanized sheets, 2c., Valley, for blue annealed, and 2.60c., Pittsburgh, or 2.65c., Valley, for black. After some hot weather checks, the industry is back to nearly 85 per cent of capacity operations.

Sales of sheets showed a sharp gain in June, the records of the independent producers being 318,902 tons in June against 250,316 tons in May. Shipments were only 10,000 tons less than sales and unfilled orders at the end of the month remained substantially equal to those at the end of May.

Alloy steel bar mills continue at an 85 to 90 per cent rate, or only a few points below their peak.

Included in rail sales reported last week were 40,000 tons for the Norfolk & Western. Chicago reported purchases in the week of 6000 tons of track supplies and specifications for 7000 tons. The Hocking Valley bought 1400 tons of tie plates.

Pig iron prices show no strength. In addition to the decline of 50c. a ton on No. 2 foundry in the Valley, lower prices have appeared in New England, especially on the higher silicon grades. An eastern Pennsylvania steel company will probably buy 20,000 tons or more of basic iron this week.

Heavy melting steel scrap has strengthened at Pittsburgh, following many weeks of such low prices that many shippers have withheld supplies from the market. At Chicago, arrangements are being made to ship scrap by water to Lake Erie steel plants.

Canadian production of iron and steel in June was ahead of June last year and the output for the half year was the highest in ten years.

Welsh makers of tin plate, facing an uncertain market and easing prices, have decided to reintroduce a restriction of output, all mills to close for two weeks during the period of Aug. 27 to Nov. 24.

THE IRON AGE pig iron composite price has dropped to \$17.04 a gross ton, from \$17.09 of the two preceding weeks. The finished steel composite price remains at 2.319c. a lb. for the second week.

Steel Business Sufficient to Maintain 75 Per Cent Ingot Output—Usual Summer Slump Not Expected

PITTSBURGH, July 24.—With business in finished steel products sufficient to sustain an ingot production at 75 per cent of capacity, this rate representing a slight upturn, the idea is being dissipated that there will be the usual summer slump in output. The past week has been the best, with one exception, the American Sheet & Tin Plate Co. has had in sheets this year. The high rate of operation by independent sheet producers suggests that they, too, have been doing well. Leading tin plate manufacturers have specifications on contracts that support strongly the statement that no considerable amount of new business is necessary to insure mill operations of 90 per cent or higher well up to the end of September.

Good specifications are reported for steel bars, and while only a moderate amount of fabricated steel business is developing in this immediate area, the national prospect has rarely been brighter. A fair-sized order for standard-section rails came to the local producer in the past week. Line pipe orders are the principal prop to pipe mill operations, but at the same time producers are generally reporting an improved demand for oil well pipe. Wire products are dull. Cold-finished

steel bars and strip steel are not moving with quite as much freedom this month as they did in June. The loss of tonnage, however, is slight and the showing is favorable when comparison is made with other years at this season.

None of the important channels of steel outlet has narrowed materially. Much surprise is expressed that the demand from the automobile builders is holding up so well; one explanation is that the used car problem is

less serious than usual, owing to the fact that not a few of the better cars taken in trade for new cars are being reconditioned and exported to South American countries and sales of new cars are less hampered than usual by bargains in used cars.

As to steel prices, it is noticed that strips still are weak and that the effort to establish bars, plates and shapes upon a higher basis is not gaining rapid headway. There is little question that some companies covered their customers fully for this quarter at 1.85c., base Pittsburgh, and there was no other course open to others but to keep the doors ajar for their patrons. Possibly a little difficulty might be encountered now in entering new business at less than 1.90c., base, but there has been such wide coverage as to preclude the occasion for much new buying. The sheet market appears stronger here than in some other markets and there are suggestions that the decline must be checked soon if there is to be any possibility of more satisfactory returns on fourth quarter business.

Foundry iron is easier and the pig iron market as a whole is little more

than nominal, since demands are very limited. The scrap market, on the other hand, is slightly firmer; there is a considerable short interest in heavy melting steel and some of the dealers who sold short probably are nervous as offerings are very light at present prices. The situation in the fuels is dull and depressed.

Ferroalloys.—While the steel industry is operating at a high rate for the time of year, it is below full capacity and consumption of all primary materials is well under the rate of the early months of the year. Liberal takings last month against expiring first half ferromanganese contracts have given users enough of this alloy to carry them through this month, and accordingly there is not much specifying on second half commitments. Spiegeleisen is not being ordered out as freely as was the case a few weeks ago, but there is little complaint as to the movement of high grade ferro-silicon. Spot demands for all three alloys are few and small. Prices are unchanged.

Pig Iron.—Foundry iron is weaker in this market. While most producers continue to quote \$16.75, Valley furnace, for No. 2 grade—and small lots are being moved at that price—the more important tonnages are going at \$16.50. The Westinghouse Electric & Mfg. Co., which recently closed for its requirements over the remainder of this year, is believed to have secured its supplies at the latter price, although the iron is somewhat special in analysis. Other sales of more than carload lots having been made at that price, the market now is clearly quotable at \$16.50 to \$16.75. No corresponding decline is noted in the foundry irons of lower silicon content. There seems to be some scarcity of No. 3 and gray forge iron, and instead of being at a discount of 50c. a ton from the base grade, the difference is measured by 25c. One sale of 300 tons of Bessemer iron is reported at the full quotation of \$17, Valley furnace. Malleable iron is quoted at the same price as Bessemer, but only scattering small sales are being made. Interest in basic iron is low, and while this grade is commonly quoted at \$16, Valley furnace, the price is merely

nominal as there are no sales. The Standard Sanitary Mfg. Co. was a buyer within the week of about 2500 tons of foundry iron for shipment in this quarter to its Louisville, Ky., works. It bought Southern iron, paying \$15.50, Birmingham, for the base grade. This was merely fill-in buying, none of which will be necessary for the local plants, which are carrying over enough first half iron to supply this quarter's needs. Carnegie Steel Co. has put on a furnace which has been down for repairs and now has 27 of its 49 stacks in production. The Adrian furnace, Dubois, Pa., will be blown in Aug. 1 for a brief campaign to liquidate its ore pile.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$16.00
Bessemer	17.00
Gray forge	\$16.25 to 16.50
No. 2 foundry.....	16.50 to 16.75
No. 3 foundry.....	16.25 to 16.50
Malleable	17.00
Low phos., copper free....	26.50

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Billets, slabs and sheet bars are all at \$32, Pittsburgh or Youngstown, for delivery on third quarter contracts, but on spot tonnages of large billets and slabs the usual quotation is \$33, and producers already are mentioning \$33 as the fourth quarter contract price on sheet bars. Specifications are fairly heavy. Improving welded pipe mill operations are responsible for heavier releases of pipe skelp. Wire rods are only moderately active; the regular quotation is \$42, base Pittsburgh or Cleveland, and reports that less is being done, makers assert, refer to deliveries against some old contracts which were not cancelled. Forging quality billets still are priced at \$38, base Pittsburgh.

Bars, Plates and Shapes.—While the price of 1.85c., base Pittsburgh, has not disappeared, there being considerable pending tonnage on which that price was quoted, buyers are experiencing difficulty in finding producers willing to take on new business for shipment during the remainder of this quarter at less than 1.90c. On the other hand, there was so much covering by the mills of customers for this period at 1.85c., base, that there is

left only the small spot tonnages, which as often as not command a slight premium over the contract price. Announcement of the fourth quarter price so long in advance of the opening of that period still occasions wonderment among fabricators and distributors, since there is no evidence of the sold-up condition of steel mills that in former years led to announcements of price advances well in advance of their application. But there is no lack of seriousness among the steel manufacturers in the effort to bolster prices, and it is believed that in giving the users an opportunity to revise secondary prices there is a good chance that the 2c. price will become effective on last quarter tonnages.

Rails and Track Supplies.—The Norfolk & Western Railroad has placed 40,000 tons of standard-section rails, 29,000 tons going to the Carnegie Steel Co. and the remainder to the Bethlehem Steel Co. This road's orders are fully one-third smaller than the average of the past few years. A local mill recently booked 2400 kegs of spikes and about 1400 tons of tie-plates for the Hocking Valley Railroad. Except for these awards, rail and track accessory business has been rather slack.

Wire Products.—The recent downward revision in prices has produced a steady market. Business, taken as a whole, however, has not increased materially; probably because the movement into consumption has not been heavy enough to overcome the large mill shipments early in the year, which were stimulated by the desire to avoid price advances.

Tubular Goods.—Mills are well supplied with pipe line business, and while backlogs are small in other classes of tubular goods, it is noticed that there is a very steady demand for pipe for building and construction work and oil country pipe is selling with more freedom than it did early in the year. Mill operations are fully 70 per cent of capacity, a good showing compared with that of a month or six weeks ago.

Sheets.—There is no occasion for complaint as to the volume of sheet

Carbon Vanadium	0.95	3.60

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is 1c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00
Light (from billets), f.o.b. mill.....	36.00

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

business, nor of the rate of mill operations, which in the past week have taken an upward swing. Because of some liberal releases by the automotive industry, the orders of the American Sheet & Tin Plate Co. in the past week were the largest, with one exception, of any week this year. This company's business this month has been equal to 90 per cent of its productive capacity. Independent companies also have fared well and the industry at large is averaging close to 85 per cent of capacity, the American Sheet & Tin Plate Co. having moved to an 81 per cent rate. Prices appear to be a little firmer. While lower prices have been noted in some markets, 2.65c., base, Pittsburgh, still is regarded as the minimum here on black sheets. Galvanized sheets are readily obtainable at 3.50c., base, Pittsburgh, but there are some small sales at 5c. per 100 lb. higher. On blue annealed, 2c., base, is the prevailing price, despite lower prices on this grade by manufacturers of strips and light plates. Generally, however, there is less pressure to sell, as few mills lack orders.

Tin Plate.—Leading producers are well sold up for the next 60 days on specified contract commitments; mill operations continue at 90 per cent or more of capacity. Current demand does not amount to much and makers are well satisfied, as the weather is against efficient mill operations.

Cold-Finished Steel Bars and Shafting.—Demand, particularly from the makers of automobile parts, is steady. July bookings and specifications average well up to those of last month, which is a pleasant surprise in view of the fact that July ordinarily brings a recession. Prices are steady at 2.10c., base, but some makers say that if the price of hot-rolled bars is fully established on fourth quarter busi-

ness at 2c., base, they must get more than an advance of 10c. per 100 lb. on fourth quarter tonnages.

Hot-Rolled Flats.—Orders and specifications for hot-rolled strips so far this month are below those for the corresponding period in June. Wide strips are weak because of the stronger desire among producers for orders and the competition of other flat-rolled products. Narrow material is fairly steady in price, and hoops and bands are firm at 2.20c., base. Narrow strips range from 2.10c. to 2.20c.; 3 to 6-in., 2c., and 6-in. and wider, 1.80c. to 1.90c.

Cold-Rolled Strips.—This month's business has been slightly smaller than in the same period last month. Prices still are rather soft, but with 2.75c., base, Pittsburgh, for lots of 3 tons or more of one size and temper for shipment at one time ruling on most of the business. In a few cases embracing particularly desirable business as low as 2.65c. has been done, but on the other hand material for typewriters, adding machines and cash registers, tonnages of which are small and the specifications exacting, has been going at 2.85c. to 2.90c., base, or 3.10c. to 3.15c., base, for lots of 1 to 3 tons.

Bolts, Nuts and Rivets.—Business is only moderately active, but prices are holding firmly.

Coke and Coal.—The action of the policy committee of the United Mine Workers of America in withdrawing the Jacksonville scale as a basis of wage scale negotiations has been without effect, marketwise, except possibly to strengthen the idea of buyers that they have nothing to fear in the way of shortages. Demand for coal is duller, if that is possible, than it has been and prices are as much as ever in buyers' favor. There is no well defined spot market for beehive coke. Occasional cars of furnace and foundry grade are moved at quoted prices.

Old Material.—The market here is a shade firmer. One mill has purchased a fair-sized lot of heavy melting steel at \$14.50, while dealers who recently went short of good-sized lots

at two consuming points in the district are finding it rather difficult to cover at much under \$14, the price at which they sold. While small lots are being picked up at \$13.50 and \$13.75 by dealers, there are no sizable offerings at such prices, and if the mills that bought were to press for deliveries, some active and competitive bidding might be expected. The short interest in this grade is heavy, and it is reasonably safe to say that prices have struck a bottom in view of this shortage. There have been sales of compressed sheets at \$14 and of bundled sheets at \$13 and \$13.25, while scrap rails have been moved at \$14, these prices being slightly more than could have been obtained previously. There is little activity in other directions and no material change in prices.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$14.00 to \$14.50
Scrap rails	13.50 to 14.00
Compressed sheet steel....	13.75 to 14.00
Bundled sheets, sides and ends	13.00 to 13.25
Cast iron carwheels.....	14.00 to 14.50
Sheet bar crops, ordinary.	14.50 to 15.00
Heavy breakable cast....	11.50 to 12.00
No. 2 railroad wrought....	14.00 to 14.50
Heavy steel axle turnings.	13.00 to 13.50
Machine shop turnings....	9.00

Acid Open-Hearth Grades:	
Railr. knuckles and couplers	14.75 to 15.25
Railr. coil and leaf springs	14.75 to 15.25
Rolled steel wheels.....	14.75 to 15.25
Low phos. billet and bloom ends	19.00 to 19.50
Low phos., mill plate....	17.50 to 18.00
Low phos., light grade....	16.50 to 17.00
Low phos. sheet bar crops.	17.50 to 18.00
Hvy. steel axle turnings..	13.00 to 13.50

Electric Furnace Grades:	
Low phos. punchings.....	16.00 to 16.50
Hvy. steel axle turnings..	13.00 to 13.50

Blast Furnace Grades:	
Short show'lg steel turnings	9.50
Short mixed borings and turnings	9.50
Cast iron borings.....	10.00
No. 2 busheling.....	8.50 to 9.00

Rolling Mill Grades:	
Steel car axles.....	18.00 to 18.50
No. 1 railroad wrought....	10.50 to 11.00
Sheet bar crops.....	16.00 to 16.50

Cupola Grades:	
No. 1 cast.....	14.25 to 14.50
Rails 3 ft. and under....	15.00 to 15.50

Malleable Grades:	
Railroad	13.75 to 14.50
Industrial	13.25 to 13.75
Agricultural	12.75 to 13.25

Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Locomotives in Much Better Repair

Fewer locomotives were in need of repair on the Class I railroads on July 1 than at any time since the compilation of these reports began, according to reports filed by the carriers with the Car Service Division of the American Railway Association.

The number on July 1 was 8006 locomotives, or 13.4 per cent of the number on line. This was a reduction of 251 locomotives compared with the best previous record, which was established on Jan. 1 last. At that time there were 8257 locomotives awaiting

repairs, or 13.6 per cent. The number on July 1 showed a reduction of 753 compared with the same date in 1927, when there were 8759, or 14.3 per cent.

Production of bituminous coal in the United States in the week ended July 14 is reported at a daily average of 1,435,000 net tons. This is higher than in either of the two preceding weeks and is nearly 5 per cent above the figure for a year ago. For the calendar year to date a total of 249,726,000 tons has been mined, compared with 291,233,000 last year to the same date.

Chicago

Steel Demand Steady, Though Orders Are Individually Smaller—Mill Operations Continue at 75 Per Cent

CHICAGO, July 24.—Local mills are still able to operate at 75 per cent of capacity, but both specifications and orders are growing individually smaller, reflecting increasing conservatism on the part of buyers. Total bookings of producers show surprisingly little change, but the character of current business is such as to make it difficult to forecast operations for more than a week or two ahead. Sales and specifications in the past seven days were nearly as large as in the previous week and considerably heavier than in the first week of July. New commitments in bars and track materials exceeded those in other products. Specifications from the automotive and farm equipment industries show little, if any, recession, and heavier releases have come from makers of cold-drawn steel bars and manufacturers of bolts, nuts and rivets, who had permitted stocks to run below their normal requirements.

A steady flow of specifications for bars, shapes and plates is coming from the railroads. The carriers also account for the good volume of business in track supplies, sales of these products for the week having totaled 6000 tons and specifications 7000 tons. Improved earnings by Northwestern roads, as well as good crop prospects, are expected to result in more liberal purchases of steel in coming months. Meanwhile, railroad car buying shows no indications of reviving on a broad scale and the shops of freight car builders are fast reaching the point where they must shut down. Such a suspension of operations cannot be avoided even if large car orders are placed this month because it takes fully 60 days to assemble materials before work on a car order can be started.

An inquiry for 5000 tons of steel for 12 storage tanks to be built in western Texas is particularly opportune in view of the growing shortage of heavy tonnage orders. Another promising development in the oil industry is the announcement that the Sinclair Pipe Line Co., jointly owned by the Standard Oil Co. of Indiana and the Sinclair Consolidated Oil Corporation, plans to spend \$15,000,000 on an 8 to 12-in. pipe line from the Southwest to Chicago. No figures have been taken on this project and no doubt some time will elapse before orders for the steel are actually placed. A proposed pipe line from Louisiana to Kansas City is expected to mature earlier.

Lettings of fabricated steel are lighter and few new projects are coming out for figures. Fabricators are still fairly well engaged, particularly on smaller jobs, but the trend of the situation is reflected in the fact that the larger structural mills are not operating so well as those rolling smaller sections.

Mill prices are unchanged. The determination of producers to strengthen the market is seen in an announcement by the leading local independent that it has followed the Steel Corporation subsidiary in advancing plates, shapes and bars to 2.10c., Chicago, for fourth quarter deliveries. On new business for the current quarter, 2c., Chicago, is the ruling price, and that was also the governing quotation on

most third quarter contracts. Some of the tonnage buyers who usually get a preferential price because of quantities they take in desirable specifications were able to close contracts for this quarter at 1.95c.

Blast furnace operations in this district are unchanged. While some of the steel mill stacks are piling pig iron and using a larger proportion of pig metal in their open-hearth furnaces, the scrap market appears to be holding its own. A local independent steel producer bought several thousand tons of steel scrap at recently ruling prices, including heavy melting steel at \$12.75, and another interest bought several small lots at \$13.

The local scrap trade is investigating the possibility of shipping scrap by water to Lake Erie ports and, if present negotiations are successful, a cargo will be moved from Chicago within the next few weeks.

Ferroalloys.—It is understood that several large buyers of ferromanganese did not contract for their second half requirements and a large Michigan consumer claims to have bought within the past few weeks at less than the ruling quotation of \$105, seaboard. A number of users still have large stocks and those with contracts for this half are not yet actively specifying. There are a few car lot inquiries for spiegeleisen, which continues to range from \$32 to \$33, furnace, for 19 to 21 per cent material.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$87.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Pig Iron.—A local consumer is in the market for 2000 tons of foundry iron for shipment over the remainder of the year. No other large inquiries are reported, but a fair amount of spot buying has developed during the week. The fact that no concessions are being offered at the new price level is tending to increase confidence in the stability of the market. Foundry operations are spotty, but in some directions melt is improving, as evidenced by the fact that a large Milwaukee plant and several Michigan shops are advertising for molders. Several motor car companies that have brought out new models are increasing production, and this has re-

sulted in heavier specifications for silvery iron. Shipments of pig iron from Chicago district furnaces are about on a par with those of June. Sales in this market in the first seven months of this year kept pace with those of the same period in 1926, a year which broke all previous records in both sales and shipments. An inquiry for 500 tons of low phosphorus is before the trade.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25..	\$17.50
N'th'n No. 1 fdy., sil. 2.25 to 2.75..	18.00
Malleable, not over 2.25 sil.....	17.50
High phosphorus	17.50
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail).....	21.51
So'th'n No. 2 (barge and rail).....	21.01
Low phos., sil. 1 to 2, copper free	\$28.50 to 29.00
Silvery, sil. 8 per cent.....	29.79
Bess. ferrosilicon, 14-15%.....	46.79

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Bolts, Nuts and Rivets.—Specifications are a trifle lighter than in June, but better than usual for this season.

Plates.—The Texas & Pacific Oil Co. is in the market for 12 80,000 bbl. oil storage tanks for western Texas, calling for a total of 5000 tons of plates. This is the first inquiry for storage tanks in some time. Local plate mills could use heavy-tonnage orders to advantage at this juncture, but they are still able to operate at a 65 per cent rate, despite the miscellaneous character of current business. Orders and specifications in the past seven days were not quite so heavy as in the previous week, although larger than in the first week of the month. Mill prices are steady at 2c., Chicago, on new business, and the majority of third quarter contracts carry that price, although some preferential buyers who take large tonnages in attractive specifications were able to cover at 1.95c.

Mill prices on plates, per lb.: 2c., base Chicago.

Structural Material.—The A. O. Smith Corporation, Milwaukee, has placed from 2500 to 3000 tons for a pipe shop with the Wisconsin Bridge & Iron Co. Other fabricating awards in Wisconsin total more than 1200 tons, but lettings in this city and vicinity are light. A number of large tonnages are pending here, including 7000 tons for junior high school buildings. Meanwhile, the larger structural mills are feeling the lack of new business. Nevertheless, production of plain material as a whole remains at a higher rate than plate mill operations. Mill prices are holding to 2c., Chicago.

Mill prices on plain material, per lb.: 2c., base, Chicago.

Bars.—Bar mill products continue to lead other forms of finished steel in both sales and specifications. Business from the automobile and farm equipment industries shows little, if any, recession. Mill prices on soft steel bars are steady at 2c., Chicago. Mills rolling alloy steel bars, which are more largely dependent on the automotive industry, are operating at 85 to 90 per cent of capacity, or only a

few points below their peak. Bookings in bar iron, particularly from the railroads, are keeping up well, and mill prices are consistently 2c., Chicago. Rail steel bar producers find production, specifications and shipments are ahead of those in July, 1927. Bed makers, who have experienced dull times for nearly a year, made heavy sales at the recent Furniture Exposition and are more liberal in specifying for rail steel. Farm equipment makers continue to take a steady flow of tonnage. Rail steel bars are unchanged at 1.85c., Chicago Heights mill.

Mill prices per lb.: Soft steel bars, 2c., base, Chicago; common bar iron, 2c., base, Chicago; rail steel bars, 1.85c., base, Chicago Heights mill.

Sheets.—Business shows no improvement, but prices are unchanged. Because of uneven specifications and hot weather, Chicago district mills operated at less than 60 per cent of capacity last week.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.15c. Deliv'd prices at other Western points are equal to the freight from Gary plus the mill prices, which are 5c. per 100 lb. lower than Chgo. deliv'd prices.

Reinforcing Bars.—There continues to be a good run of lettings of less than 100 tons each, but large awards are less numerous. Action on pending work is being delayed more than usual, possibly on account of the vacation season. Bending shops are still able to operate at 75 to 80 per cent of capacity. Awards and fresh inquiries are shown on page 230.

Tin Plate.—Mills have excellent bookings and are now insisting on a minimum of \$5.35 per base box, Gary, on standard coke plate from all buyers in this territory.

Wire Products.—Mills continue to operate at 65 per cent of capacity, and specifications are the best for any July in a number of years. Much of the current tonnage, however, is coming from the manufacturing trade rather than from jobbers. Nail demand in the Chicago metropolitan area has been adversely affected by the trend of residential construction, which for the year to date has declined about 40 per cent compared

with the same period in 1927. The outlook in the agricultural sections is promising, but actual buying by the farmers will be held back until their heavy field work is completed. Mill salesmen are again on the road, however, and improved business in certain lines, such as fencing, is expected to manifest itself by the middle of next month. For mill prices see page 239.

Rails and Track Supplies.—The Norfolk & Western has placed 29,000 tons of rails with the Carnegie Steel Co. and 11,000 tons with the Bethlehem Steel Co. New rail bookings by local mills were confined to three small orders totaling 1200 tons. Rail production of the leading mill continues at 60 per cent of capacity. Sales of track fastenings during the week totaled 6000 tons, while specifications aggregated about 7000 tons. Light rail business is restricted to scattered car lot sales, but bookings in June were about twice the recent monthly average.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Bids taken by Milwaukee July 18 on 2000 tons brought out prices ranging from \$33 to \$34.30, Birmingham. Only one bid, that of the United States Cast Iron Pipe & Foundry Co. on 750 tons of 6-in., was as low as \$33. Most quotations on current business range from \$34 to \$35, Birmingham, for 6-in. and larger diameters. St. Paul, Minn., has awarded 1100 tons of 6 to 16-in. pipe to the United States Cast Iron Pipe & Foundry Co.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$41.20 to \$43.20; 4-in., \$45.20 to \$47.20; Class A and gas pipe, \$4 extra.

Old Material.—A local mill has bought several thousand tons of heavy melting steel, compressed sheets and borings at prices in line with those quoted below. The fact that these orders did not develop new weakness in the market indicates a steadier situation than some traders had looked for. While some mills are using more pig iron and less scrap, there are no heavy accumulations in dealers' hands. Dealers have been doing little speculating and are shipping out material,

as a rule, as fast as it is prepared. Prices have shown no marked change during the week and apparently will not be disturbed greatly unless heavy railroad offerings come on the market. A further possible decline in mill operations, of course, is also a factor that must be considered. Foundry operations are spotty. In Michigan, however, the melt is improving, especially among malleable foundries serving the automobile industry. The Chicago, Burlington & Quincy takes bids today on 500 tons of scrap.

Prices deliv'd consumers' yards, Chicago:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel.....	\$12.25 to \$12.75
Shoveling steel.....	12.25 to 12.75
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraul. compressed sheets	11.00 to 11.50
Drop forge flashings.....	9.50 to 10.00
Forg'd, cast and r'd steel carwheels.....	15.50 to 16.00
Railr'd tires, charg. box size.....	15.50 to 16.00
Railr'd leaf springs, cut apart.....	15.50 to 16.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	13.75 to 14.25
Coil springs.....	15.75 to 16.25
Electric Furnace Grades:	
Axle turnings.....	12.50 to 13.00
Low phos. punchings.....	14.00 to 14.50
Low phos. plate, 12 in. and under.....	14.00 to 14.50
Blast Furnace Grades:	
Axle turnings.....	9.50 to 10.00
Cast iron borings.....	9.00 to 9.50
Short shoveling turnings..	9.00 to 9.50
Machine shop turnings....	6.00 to 6.50
Rolling Mill Grades:	
Iron rails.....	13.50 to 14.00
Rerolling rails.....	14.75 to 15.25
Cupola Grades:	
Steel rails less than 3 ft..	15.25 to 15.75
Angle bars, steel.....	14.25 to 14.75
Cast iron carwheels.....	12.75 to 13.00
Malleable Grades:	
Railroad.....	12.50 to 13.00
Agricultural.....	11.50 to 12.00
Miscellaneous:	
*Relay'g rails, 56 to 60 lb.	23.00 to 25.00
*Relay'g rails, 65 lb. and heav.	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angles and splice bars	13.50 to 14.00
Iron arch bars and transoms.....	19.50 to 20.00
Iron car axles.....	24.00 to 24.50
Steel car axles.....	15.50 to 16.00
No. 1 railroad wrought..	10.75 to 11.25
No. 2 railroad wrought..	11.00 to 11.50
No. 1 busheling.....	9.50 to 10.00
No. 2 busheling.....	5.75 to 6.25
Locomotive tires, smooth..	12.00 to 12.50
Pipes and flues.....	8.00 to 8.50
Cupola Grades:	
No. 1 machinery cast....	13.50 to 14.00
No. 1 railroad cast.....	12.75 to 13.25
No. 1 agricultural cast....	12.50 to 13.00
Stove plate.....	10.75 to 11.25
Grate bars.....	11.25 to 11.75
Brake shoes.....	10.00 to 10.50

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Railroad Equipment

PURCHASE of 150 box cars by the International Railways of Central America and an inquiry from the Missouri Pacific for 100 automobile cars are the only features of a dull market. Details follow:

International Railways of Central America have purchased 150 box cars from Gregg Co.

United States Navy Department has ordered one tank car for carrying helium gas from General American Tank Car

Corporation and is inquiring for two gondola cars.

Cities Service Co. is inquiring for 10 tank cars in addition to four reported ordered last week.

Chicago Great Western has ordered three mail and baggage cars from Pullman Car & Mfg. Corporation.

Carnegie Steel Co. has ordered repairs to 16 hopper cars from Greenville Steel Car Co.

Canadian National has ordered three mail and baggage cars from American Car & Foundry Co.

Missouri Pacific is inquiring for 100 50-ton single-sheathed automobile cars.

New York

Pig Iron Buying Fairly Well Sustained—Newspaper Building Takes 13,000 Tons of Steel

NEW YORK, July 24.—Following a week of rather heavy buying for this season of the year, pig iron sales during the last week have kept up at a fair rate, totaling about 7500 tons. In some cases this tonnage represents extensions of second quarter contracts which have just now run out, and the bulk is for delivery during July and August. There is evidence that many melters have not yet covered fully for their third quarter requirements, but they find no difficulty in arranging immediate shipments and are thus able to maintain extremely low reserves. Many large consumers are carrying stocks of iron hardly sufficient for a week's operations. The week's sales, which consisted mostly of small lots, also give further indication of the increased melt of foundries in this district. New inquiry is not large, but melters are often buying without the usual delays, indicating their immediate need of supplies. Interest in fourth quarter requirements is evidenced by an inquiry for that period from the A. P. Smith Mfg. Co., East Orange, N. J., for 750 tons of No. 2 plain and No. 2X. Another New Jersey melter is said to be in the market for 1000 tons and a user served by this district is negotiating for the purchase of 2500 tons, both of these prospective purchases being for August and September delivery. The recent inquiry for 2000 tons of ballast iron for shipment to the Pacific Coast is still pending, but may not be acted upon, at least not in full. A large manufacturer of heating equipment in western Massachusetts is expected to come into the market for a round tonnage next week. There is little change in the price situation, with Buffalo foundry iron offered at \$16 to \$17, furnace, and the ruling price tending more toward the lower than the higher figure. Eastern Pennsylvania producers are quoting \$19.50, furnace, for the base foundry grade, and since the recent 50c. reduction have been showing more interest than before in meeting the competition of Buffalo makers in New Jersey.

Prices per gross ton, deliv'd New York district:

Buffalo No. 2 fdy., sil.	1.75 to 2.25	\$20.91 to \$21.91
East. Pa. No. 2 fdy., sil.	1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil.	2.25 to 2.75	21.39 to 22.52
East. Pa. No. 1X fdy., sil.	2.75 to 3.25	21.89 to 23.02

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

Bars, Shapes and Plates.—Some sales of steel bars, one or two of 100 tons, have been made at the new price of 1.90c., Pittsburgh, to consumers who did not sign third quarter contracts. Small lots of plates and shapes have also been sold at the \$1 a ton advance, or 2.22½c., New York, for plates, and 2.19½c., New York,

for shapes. However, so many buyers are covered by extensions of second quarter prices that the higher prices have appeared so far on only a small part of the steel shipped this month.

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes.....	3.30c.
Soft steel bars, small shapes.....	3.25c.
Iron bars.....	3.24c.

No. 30.....	5.40c. to 5.60c.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

There is no mistaking, however, the firmer attitude of producers, which extends to the fourth quarter price of 2c., Pittsburgh, on these products. Demand for bars continues fairly active for this time of year, while the specifying of structural steel for building construction now under way gives structural mills a fairly high rate of operation. Plate demand is less active, but Eastern mills are running at about the same rate as in recent weeks. The outstanding structural steel award of the week was 13,000 tons for the *Daily News* building on East Forty-second Street, New York, which was taken by the Harris Structural Steel Co.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.19c. to 2.24c.; plates, 2.12½c. to 2.22½c.; struct. shapes, 2.14½c. to 2.19½c.; bar iron, 2.14c.

Sheets.—Some of the larger producers of sheets are taking a firmer stand on prices. In several instances mills have declined business in black sheets offered at 2.60c., Pittsburgh, and have insisted on a minimum of 2.65c. On galvanized sheets, 3.40c., Pittsburgh, has been reaffirmed by these mills as their minimum, notwithstanding that a few sales had been made at 3.35c. The 3.40c. price generally applies to orders from jobbers and most consumers are being asked to pay 3.50c. Sales of the blue annealed sheets have been made at 1.90c. and 1.95c., Pittsburgh, but these concessions are not general and the bulk of current business is at not less than 2c., Pittsburgh. The volume of sheet buying is fairly satisfactory, but it is nearly all spot business, few consumers or jobbers having made contracts for this quarter.

Reinforcing Bars.—Bids will close July 25 on a high school at White Plains, N. Y., which will require about 500 tons of bars. This is the largest new project reported recently, but there is still a fair volume of pending tonnage, including a warehouse in the Bronx for the Lehigh Valley Railroad, which will take 1200 tons. Day & Goater, Inc., is reported to have secured the contract for a section of the subway in New York, on which Rodgers & Hagerty, Inc., is general contractor, calling for approximately 700 tons. On the general run of small orders, 1.90c., Pittsburgh mill, is the ruling price, but on some recent larger jobs concessions of at least \$1 a ton have been reported. Warehouse prices are unchanged.

Warehouse Business.—Jobbers report that orders are slightly larger in size than during June and the total July tonnage is expected to be greater than for several months. There is a moderate demand for blue annealed sheets, on which the quoted price of 3.90c. per lb., base, is being maintained. Black and galvanized sheets, however, are being shaded in the metropolitan district and concessions from 3.80c. per lb. on black and 4.50c. per lb. on galvanized are not unusual on desirable orders.

Cast Iron Pipe.—Quotations of

Birmingham makers of pressure pipe continue in excess of the prices of Northern foundries, but business in this district is small and operations of makers in the North are still rather limited. Delivered prices continue to range from \$37.60 to \$38.60 per ton, New York. The American Construction & Securities Co., New York, is reported to have closed on about 800 tons of water pipe with two Birmingham makers, half for use near Birmingham and half for delivery to Pittsburgh. Newark, N. J., has closed on 300 tons of water pipe with the Warren Foundry & Pipe Co., and the Department of Water Supply, Gas and Electricity, New York, has awarded 300 tons of 8 and 12-in. pipe to the same company.

Prices per net ton, deliv'd New York:
Water pipe 6-in. and larger, \$37.60 to \$38.60; 4-in. and 5-in., \$42.60 to \$43.60; 3-in., \$52.60 to \$53.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Conditions in this market have not changed materially during July except for a slight increase in consumption of foundry coke. Demand for the special brands is keeping up and ovens report steady specifications which do not allow the accumulation of stocks. Foundry coke is unchanged at \$3.50 per net ton, Connellsville, with the furnace grade quoted at \$2.50 to \$2.75. Special brands of foundry coke are offered at \$4.85, f.o.b. ovens, and delivered prices are \$8.56 per net ton to northern New Jersey, Jersey City and Newark and \$9.44 to New York and Brooklyn. By-product foundry coke is unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06 to \$10.29, New York or Brooklyn.

Old Material.—Dealers' buying prices on most grades show further slight reductions, based on recent sales to eastern Pennsylvania consumers. No. 1 heavy melting steel is being bought at \$12.50 per ton, delivered eastern Pennsylvania, and yard grade is quoted at about \$10 per ton, delivered. Stove plate for local foundries is being bought at \$10.25 per ton, delivered on a \$2.02 per ton freight rate, and \$10.50 per ton, delivered on a \$1.89 per ton freight rate.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$9.00 to \$9.85
Heavy melting steel (yard)	6.00 to 6.25
No. 1 hvy. breakable cast.	10.50 to 11.00
Stove plate (steel works)...	6.75 to 7.25
Locomotive grate bars....	6.75 to 7.25
Machine shop turnings...	6.00 to 6.50
Short shoveling turnings..	6.00 to 6.50
Cast borings (blast furn. or steel works).....	6.00 to 6.50
Mixed borings and turnings	6.00 to 6.50
Steel car axles.....	13.50 to 14.00
Iron car axles.....	23.50 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	8.25 to 8.75
Forge fire	6.50 to 6.75
No. 1 railroad wrought....	9.00 to 9.50
No. 1 yard wrot., long....	7.50 to 8.00
Rails for rolling.....	10.00 to 10.50
Cast iron carwheels.....	11.00 to 11.50
Stove plate (foundry)....	8.25 to 8.75
Malleable cast (railroad)...	10.00
Cast borings (chemical)...	10.75 to 11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machy. cast.....	\$14.00 to \$15.00
No. 1 hvy. cast (columns bldg. materials, etc.), cupola size	12.00 to 13.00
No. 2 cast (radiators, cast boilers, etc.)	11.50 to 12.50

Philadelphia

New Bar, Plate and Shape Prices Not Yet Fully Established —Large Basic Iron Inquiry

PHILADELPHIA, July 24.—The advance of \$1 a ton on plates, shapes and bars for this quarter has not yet been fully established. On small orders for prompt shipment, plates are bringing 2.05c., Coatesville, and bars 1.90c., Pittsburgh, but with contracts for this quarter at prices \$1 a ton lower and some extensions of second quarter contracts, desirable new business is still being placed at the old quotations, particularly in the case of preferred buyers, such as large fabricators and distributors. Shape prices continue depressed, with competition keen among eastern Pennsylvania producers. Delivered prices range from 2.06c. to 2.13c. per lb., Philadelphia, and the minimum quotation, which is quoted on delivery from Pencoyd, Pa., is reported slightly firmer than was the case recently, when as low as 2.01c., Philadelphia, was quoted on desirable orders. Sheet prices are unchanged, but concessions of \$1 a ton are apparently becoming less common, except to preferred buyers such as jobbers and the automobile body builders.

Mill operations in eastern Pennsylvania continue at a good rate in most cases. On the basis of the volume of business that has been coming in during July, most mills estimate that the month will compare favorably with March and April, the best months in the first half of the year. The leading eastern Pennsylvania interest has already booked more bar business this month than in April and at the present rate the total may exceed the March tonnage.

Pig Iron.—No concessions from \$19.50 per ton, base furnace, are reported to have been made on sales of the foundry grade, but at present no sizable tonnages are under consideration, so that a real test of the market has not been provided. Reduction of the freight rate from Buffalo to Philadelphia and nearby points from \$4.91 to \$4.66, effective until September, is not expected by sellers here to have much influence on the market, as the difference is small and the period short. The American Radiator Co. closed on 200 tons of foundry iron for its Gloucester, N. J., plant. Low phosphorus iron has been in fair demand, the Standard Steel Works Co., Burnham, Pa., having closed on about 3000 tons of the copper-bearing grade. Other consumers have purchased lots ranging from 200 to 500 tons. The Worth Steel Co. has bought 2000 to 2500 tons of basic and the Lukens Steel Co. is expected to place about 20,000 tons within the next week. Prices on this grade range from \$19 to \$19.25 per ton, delivered.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$20.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	20.76
East. Pa. No. 1X.....	21.26
Basic (del'd east. Pa.)...	\$19.00 to \$19.25
Gray forge	19.75 to 20.25
Malleable	21.00 to 21.50
Stand. low phos. (f.o.b. N. Y. State furnace)...	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	24.54
Va. No. 2X, 2.25 to 2.75 sil.	25.04

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Ferromanganese.—Consumers are apparently well covered for the second half and their contracts seem to be sufficient for current requirements as only occasional carload lots of new business are coming out. The price continues at \$105 per ton, seaboard.

Bars.—Mills are seeking to establish 1.90c., Pittsburgh, or 2.24c., delivered Philadelphia, on all new business, but with contracts outstanding for this quarter and extensions of second quarter contracts at 1.85c., Pittsburgh, desirable business is still being placed at the lower price. Demand for bars is good. A large eastern Pennsylvania interest has booked tonnage in July in excess of that in April and at the present rate may exceed its March total, the largest in the first half.

Shapes.—Fabricators are well booked with contracts, but fabricated steel prices continue at a low level. Mill quotations on shapes range from 2.06c. to 2.13c. per lb., delivered Philadelphia, the lower price being on the basis of 2c. per lb., Pencoyd, Pa. Only the smaller lots of material for prompt shipment bring 2c. per lb., Bethlehem, or 2.13c., Philadelphia, but lower than 2c., Pencoyd, is less common than a few weeks ago.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, 1/4-in. and heavier..	2.50c. to 2.60c.
Plates, 3/8-in.	2.80c. to 3.00c.
Structural shapes	2.40c. to 2.60c.
Soft steel bars, small shapes, iron bars (except bands).....	2.60c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1 1/2 x 1 1/2 in.	3.50c.
Round-edge steel, planished.....	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.50c. to 3.00c.
Cold-fin. steel, rounds and hex....	3.35c.
Cold-fin. steel, sq. and flats.....	3.85c.

Blue ann'd sheets (No. 10).....	3.15c.
Diam. pat. floor plates—	
1/4-in.	5.30c.
3/8-in.	5.50c.
Rails	3.20c.
Swedish iron bars.....	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Plates.—The volume of orders has increased, so that there is a good total tonnage moving, but individual purchases are small and usually for prompt shipment. On such business 2.05c., Coatesville, or 2.15c., Philadelphia, is not uncommon, but desirable specifications still bring out 2c., Coatesville, or 2.10c., Philadelphia.

Sheets.—A decided effort to stiffen prices on blue annealed, black and galvanized sheets is evident. Blue annealed sheets are 2c., Pittsburgh, or 2.32c., Philadelphia, but preferred buyers apparently can obtain some concession from this price. Black sheets are quoted at 2.65c., Pittsburgh, or 2.97c., Philadelphia, but 2.60c., Pittsburgh, has been done, such concessions being in most cases to distributors rather than consumers. Galvanized sheets are fairly firm at 3.50c., Pittsburgh, or 3.82c., Philadelphia, and concessions of \$1 a ton or more are only occasional.

Warehouse Business.—A larger tonnage of material is moving from stock than in June and prices are reported to be much firmer, with quantity differentials strictly maintained. While July business is not expected to be so large as that in March or April, it probably will exceed the total for June.

Old Material.—Prices of all grades still show a tendency to weakness. Buying is light. A consumer at Har-

risburg, Pa., has closed on yard grade of heavy melting steel at \$10.50 per ton, delivered, and machine shop turnings have brought \$10.25 per ton, delivered, on a recent sale to a Phoenixville, Pa., consumer. Dealers report a slightly smaller volume of scrap coming into the market and are inclined to hold available material for higher prices, but the supply is apparently more than sufficient for present consuming requirements.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$13.00
Scrap T rails.	12.50
No. 2 heavy melting steel.	10.50 to 11.00
No. 1 railroad wrought.	13.50 to 14.50
Bundled sheets (for steel works)	9.50 to 10.00
Machine shop turnings (for steel works)	10.00 to 10.25
Heavy axle turnings (or equiv.)	12.00 to 13.00
Cast borings (for steel works and roll. mill)	10.00 to 10.50
Heavy breakable cast (for steel works)	14.00 to 15.00
Railroad grate bars.	11.00 to 11.50
Stove plate (for steel works)	10.50 to 11.00
No. 1 low phos., hvy., 0.04% and under.	17.50 to 18.00
Couplers and knuckles.	14.50 to 15.00
Rolled steel wheels.	14.50 to 15.00
No. 1 blast fnace scrap.	9.50 to 10.00
Wrot. iron and soft steel pipes and tubes (new specific.)	12.00 to 12.50
Shafting.	16.50 to 17.00
Steel axles.	19.00 to 20.00
No. 1 forge fire.	11.00
Cast iron carwheels.	15.50
No. 1 cast.	15.50 to 16.00
Cast borings (for chem. plant)	14.50 to 15.00
Steel rails for rolling.	14.50 to 15.00

Orders booked by Cleveland interests during the week aggregated 26,000 tons, all in foundry and malleable iron. While this included quite a few contracts for the third quarter, many foundries are buying from hand to mouth. Shipments continue very good, being fully equal to those in June, the latter month not showing up quite as well as May. Shipments of most producers are slightly in excess of production. Prices are holding closely to recent levels. While one local producer claims to be adhering to \$16.50 for foundry and malleable grades, Cleveland iron is being offered at \$16.25 for delivery to northern Ohio points and evidently can still be had at \$16 for shipment to competitive points in southern Ohio and Indiana. One Lake furnace interest is holding to a \$16.75 minimum. In Michigan, the market is firm at \$17.50 and Lake furnaces are able to get \$18 for shipment to some points.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25.	\$18.00
S'th'n fdy., sil. 1.75 to 2.25.	21 50
Malleable	18.00
Ohio silvery, 8 per cent.	28.00
Basic Valley furnace.	16.00
Stand. low phos., Valley furn.	26.50

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—The consumption of Lake Superior ore during June amounted to 4,667,493 tons, or a decrease of 280,275 tons from May. In June last year 4,530,565 tons was used. The amount on hand at furnaces July 1 was 17,912,817 tons. The amount at furnaces and Lake Erie docks on the same date was 22,980,603 tons, compared with 26,972,594 tons on the same date a year ago. Central district furnaces in June consumed 2,305,249 tons, a decrease of 169,076 tons. Lake front furnaces used 2,191,025 tons, a decrease of 81,197 tons. Consumption by all-rail furnaces amounting to 98,375 tons showed a decrease of 24,584 tons. Eastern furnaces used 72,844 tons, a loss of 5418 tons. There were 163 furnaces using Lake ore in blast June 30, decrease of 10 for the month.

Bolts, Nuts and Rivets.—Specifications continue to come out in fair volume. New buying is rather light. Bolt and nut prices are firm. While large rivets are holding fairly steady at \$2.90 per 100 lb., a few consumers are still able to get the former \$2.75 price.

Sheets.—While orders are not as plentiful as they were a few weeks ago, new demand is fair for this season of the year, although in this immediate territory sales are very slow. A good volume of business is coming from manufacturers of electrical refrigerators and stoves. A Cleveland manufacturer purchased 500 tons for making mail boxes. Weakness is still in evidence in black sheets, on which as low as 2.65c., Valley, is being quoted. A 2.60c. Pittsburgh price is commonly quoted by mills that adhere to a Pittsburgh base. Blue annealed sheets are

Cleveland

Firmer Tone in Plates, Shapes and Bars as Business Gains—Automotive Demand Continues Good

CLEVELAND, July 24.—The volume of business in steel bars, shapes and plates gained somewhat the past week. The number of orders was large, but the average size was small, as consumers are ordering only for early needs. The tonnage entered is heavier than in July last year and this month is slightly ahead of June. The market shows a slightly firmer tone, following efforts by leading producers to get prices on a higher basis. The announcement of a \$2 a ton advance to 2c., Pittsburgh, for the fourth quarter apparently has had some sentimental effect on the current price situation. However, large consumers have been able to contract at 1.85c., Pittsburgh, for steel bars, shapes and plates for the current quarter.

On new business mills are now holding rather firmly to 1.90c., Pittsburgh, for shapes, but 1.85c. can still be done on steel bars. Plates, the weakest of the three items, are still

commonly quoted at 1.85c., Pittsburgh. The local mill base on steel bars is unchanged at 1.85c., Cleveland.

Demand for steel from the automotive industry continues unusually good. While the seasonal lull is reflected by reduced production by some of the motor car builders, this is partially offset by the increased output by some other car makers, who have brought out new models. Activity in the building field has slowed down, but fabricators are making efforts to secure better prices than have prevailed for some time. The Lake shipbuilding industry shows no life.

Pig Iron.—Sales are holding up well in some sections, although there is not much activity in the immediate Cleveland territory and in Michigan.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes.	3.00c.
Soft steel bars.	3.00c.
Reinforc. steel bars.	2.25c. to 2.75c.
Cold-fin. rounds and hex.	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands.	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.75c.
Galvanized sheets (No. 24)	4.40c. to 4.50c.
Blue ann'd sheets (No. 10)	3.25c.
No. 9 ann'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg.	2.85

*Net base, including boxing and cutting to length.

rather steady at 1.90c., Pittsburgh, and 2c., Valley, as minimum prices. Galvanized sheets appear plentiful at 3.40c., Pittsburgh, and 3.45c., Valley.

Strip Steel.—The demand is low, both in new business and in specifications against contracts. Net prices are being generally quoted on hot strip and these usually figure back to the 1.75c., Pittsburgh, or a lower base on wide material. On cold-rolled strip, 2.65c., Cleveland, is the commonly recognized price for all round-lot users. The usual differential, or 2.90c., is maintained for 1 to 3 tons. Fender stock is firm at 4.10c.

Semi-Finished Steel.—Specifications for sheet bars continue good, but there is virtually no new business, as consumers generally are under contract. The market is represented by a price range of \$32 to \$33, Cleveland, on sheet bars, billets and slabs, the point of delivery largely determining the price.

Wire Products.—The market is holding fairly steady at the recently reduced mill prices, although there is some irregularity in cement-coated nails. Demand is not very active.

Cold-Finished Steel.—Demand continues fair from the automotive and other consuming industries. The price is firm at 2.15c., Cleveland.

Reinforcing Bars.—Two Cleveland jobs requiring 750 tons have been awarded to a local mill. Union Terminal work requiring 400 tons is still pending. Prices are irregular. Some effort has been made to sell rail steel bars in Cleveland in competition with the product of local mills, but without success. Rail steel bars are quoted at 1.75c., mill.

Warehouse Business.—The usual summer lull is in evidence. Orders for all products are light. Prices are well maintained.

Coke.—The demand for foundry coke has slowed down somewhat this month, this evidently being due to the shutting down of foundries for a week or two at the first of the month. Buying is almost wholly of a hand-to-mouth character. The present price of \$7.75, Painesville, for Ohio by-product foundry coke will probably be reestablished for August. Connellsville foundry coke is unchanged at \$3.50 to \$4.85, ovens.

Old Material.—Prices are slightly lower on heavy melting steel scrap and on compressed bundles. The market has a weak tone. No. 1 heavy melting steel now carries only one price, \$13. Dealers so far have been unable to buy at a lower price. There is no new consumer demand. Local mills are taking shipments at about the recent volume and activity is limited to purchases by dealers to fill these orders. Sales to dealers during the week were at quoted prices. There is no local demand for compressed sheet steel and this is going

to the Valley district, where \$13.75 is being paid. Unusually large August scrap lists have been issued by some of the Michigan automobile companies. These include: Buick, 6000 tons; Chevrolet, 5000 tons; Chrysler, 4000 tons, and Dodge Brothers, 3500 tons.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.		\$13.00
No. 2 heavy melting steel.	\$12.25 to	12.50
Compressed sheet steel....	12.00 to	12.50
Light bundled sheet stamp'gs	11.50 to	11.75
Drop forge flashings.....	11.25 to	11.50
Machine shop turnings....	7.00 to	7.25
No. 1 railroad wrought....	11.50 to	12.00
No. 2 railroad wrought....	13.50 to	13.75
No. 1 busheling.....	11.00 to	11.25
Pipes and flues.....	9.00 to	9.50
Steel axle turnings.....	12.50 to	13.00
Acid Open-Hearth Grades		
Low phos. forging crops...	16.50 to	17.00
Low phos., billet, bloom and slab crops.....	17.00 to	17.50

Rails for rolling.....	16.25 to	16.50

Water-Cooled Engines for Huge Airplanes

Some of the reasons lying back of the development of the new X-type water-cooled aeronautic engine built by the Packard Motor Car Co. were explained recently by L. M. Woolson, aeronautic and research engineer of the company, at a meeting of the New England section of the Society of Automotive Engineers. The engine, which has 24 cylinders disposed in four longitudinal rows, resembles two V-type engines, one inverted below the other.

Speaking of the desirability of water-cooled aviation engines of the X type, Mr. Woolson said:

"I have heard of three separate projects contemplating the use of 10,000 hp. in a single airplane. I regard such designs as indicative of what we may expect in the future. The designs of these large planes are all of the thick-wing cantilever monoplane type, with cabins and engine rooms inclosed in the wings. The designs include multiple powerplants, in some cases with tractor propellers mounted in front of the leading edge and in other cases with pusher propellers aft of the trailing edge.

"We need airplanes capable of crossing the Atlantic with at least 100 passengers. Such planes will demand powerful engines, and it is inconceivable that the great parasitic resistance of many externally mounted air-cooled power plants can be permitted. Further, the need for convenient access to the engine for minor

repairs and adjustments during flight will require that the engines be suitably housed within the wing. This leads naturally to the conclusion that the engines should be water cooled."

The new engine weighs about 1500 lb. and develops approximately 1500 hp. or about 160 hp. per square foot of frontal area. It was used by Lieut. Alford J. Williams in the special Navy racing airplane with which he tried to win the world's speed record. Although it was unsupercharged, it developed 1250 hp. The addition of a supercharger will add about 100 lb. of weight and add 300 hp.

Steel Barrel Production Sets High Record

WASHINGTON, July 20.—Steel barrels to the number of 712,779 were produced in June, against 696,281 in May, according to reports received by the Department of Commerce from 27 companies owning or operating 31 plants. This makes a new high monthly record, as was that of May. The output in June was at the rate of 61.4 per cent of capacity, compared with 59.8 per cent in May. Shipments in June represented 717,496 barrels, against 694,843 in May, and stocks at the ends of the two months numbered 53,868 barrels and 58,585 respectively. Unfilled orders at the end of June for delivery within 30 days were 319,443 barrels, compared with 324,549 barrels at the end of May, while orders for delivery beyond 30 days totaled 840,313 barrels at the end of June, compared with 932,568 at the end of May.

Production of steel barrels during the first half of 1928 totaled 3,708,592, against 3,391,751 for the corresponding period of last year. The gain was 9.3 per cent. Shipments each year were within a small fraction of 1 per cent of the production figures.

Electrical Controller Boxes

A new dinkey controller, which was shown for the first time at the iron and steel convention in Chicago in June, has been brought out by the Electric Controller & Mfg. Co., Cleveland. Among the features of this controller are the following: Ebony asbestos is used in place of slate. Ventilated contacts are raised 9/16 in. from the dial face. Lugs supporting the contacts are attached to the front of the dial and are removable from the front. The contact lug has a single square-head set screw for clamping the lead wire tightly.

The Corrigan, McKinney Steel Co., Cleveland, announces that it has appointed Hickman, Williams & Co., Union Trust Building, Cleveland, its agent for the sale of its Cor-Kin domestic by-product coke.

Cincinnati

Pig Iron Sales Increase—Alabama Price Holds on 2000-Ton Transaction—Scrap Is Weaker

CINCINNATI, July 24.—Pig iron sales in the past week totaled more than 8000 tons and inquiries now before the trade indicate a fair amount of buying during the remainder of the month. The Standard Sanitary Mfg. Co. has purchased 2000 tons of No. 2 Southern foundry iron for its Louisville, Ky., plant, paying \$15.50 base Birmingham. This transaction constituted the first real test of Southern prices in the last month. A Hamilton, Ohio, melter has bought 3500 tons of foundry iron from a Lake Erie maker for about \$16, base furnace. The Norfolk & Western has placed 700 tons of foundry and malleable iron with a central Ohio producer. A company at Fort Wayne, Ind., is expected to close for 500 tons of foundry. Jackson County silvery furnaces are shipping iron at a normal rate on third quarter contracts. Prices have not changed.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$19.89
So. Ohio malleable	\$20.14 to 20.89
Ala. fdy., sil. 1.75 to 2.25	19.19
Ala. fdy., sil. 2.25 to 2.75	19.69
Tenn. fdy., sil. 1.75 to 2.25	19.19
So'th'n Ohio silvery 8 per cent	26.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—Buyers are placing third quarter specifications somewhat more freely and prices are showing a tendency toward greater stability. The announcement of producers that quotations on bars, shapes and plates for the last quarter will be 2c., base Pittsburgh, has served to strengthen the schedule of 1.90c. for current business. While there still is a dearth of sizable structural jobs, several fabricators report that the number of small lettings has been sufficient to keep their shops running at a rate approaching normal. The West Virginia Rail Co. will supply 1000 tons of rail steel reinforcing bars for a municipal reservoir at Portsmouth, Ohio, the material to be shipped by water. The largest in-

quiry is for 300 tons of bars for the Walnut garage, this city. Bar prices are steady, with new billet bars at 1.85c., base Pittsburgh, and rail steel stock at 1.80c., base, mill. Sheet mills have been booking liberal tonnages, so that from the standpoint of unfilled orders the sheet situation is eminently satisfactory, but the depressed price structure is causing anxiety. Blue annealed sheets are fairly firm at 1.90c. to 2c., base Pittsburgh, while black sheets range from 2.65c. to 2.75c. Auto body sheets remain at 4c. Irregularities are principally in galvanized sheets for roofing purposes, which are selling as low as 3.30c., although 3.40c. to 3.50c. is more representative of the market. Buying of wire products has fallen off considerably in the past two weeks. Common wire nails are quoted at \$2.55 per keg, Ironton, plus a barge rate for delivery to Ohio River points. For shipment to consumers who must rely upon all-rail delivery, however, the full all-rail rate is applied.

Warehouse Business.—There has been an improvement in sales, which are paralleling those in June. Bars are leading from the standpoint of volume, while the demand for structural steel and for sheets is lagging. Quotations are unchanged.

Coke.—Specifications for by-product foundry coke are running slightly behind those in June, while domestic grades also are moving in lessened volume. A beehive coke maker has sold 1500 tons of foundry coke to a consumer in southern Illinois for delivery during the remainder of the year. Prices are unchanged.

Old Material.—The scrap market shows signs of weakness. Many buyers have accumulated liberal stocks and consequently are refusing to consider the purchase of more material. While heavy melting steel is being fairly well maintained at \$10.75 to \$11.25, cast iron grades, sheet clips and bundled sheets have declined 25c. a ton. Agricultural malleable has dropped 50c. a ton.

Foundry coke prices per net ton deliv'd Cincinnati: By-prod. coke, \$9.02; Wise County coke, \$7.09 to \$7.59; New River coke, \$9.09 to \$9.59. Freight rates, \$2.14 from Ashland, Ky.; \$2.59 from Wise County and New River ovens. Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	\$10.75 to \$11.25
Scrap rails for melting	 10.75 to 11.25
Loose sheet clippings	 8.00 to 8.50
Bundled sheets	 9.00 to 9.50
Cast iron borings	 7.25 to 7.75
Machine shop turnings	 6.75 to 7.25
No. 1 busheling	 10.00 to 10.50
No. 2 busheling	 6.00 to 6.50
Rails for rolling	 12.50 to 13.00
No. 1 locomotive tires	 12.75 to 13.25
No. 1 railroad wrought	 10.00 to 10.50
Short rails	 15.75 to 16.25
Cast iron carwheels	 11.00 to 11.50
No. 1 machinery cast	 15.00 to 15.50
No. 1 railroad cast	 12.75 to 13.25
Burnt cast	 7.50 to 8.00
Stove plate	 8.25 to 8.75
Brake shoes	 9.50 to 10.25
Railroad malleable	 11.50 to 12.00
Agricultural malleable	 10.50 to 11.00

Birmingham

Pig Iron Shipments Increase—Steel Prices Firmer—Scrap Market Continues Dull and Weak

BIRMINGHAM, July 24.—Pig iron sales during the past week were moderate, but there is a little less tendency on the part of some melters to defer purchases until the iron actually is needed. Stove foundry buying has improved. The probable iron make for August is largely under contract. Shipments have increased some in the last few days. Furnace interests are predicting a good improvement in the market within the next few weeks. Quotations remain at \$15.50 for No. 2 foundry iron. The Tennessee company has changed its No. 2 Bessemer furnace from foundry to recarburizing iron. All six of the Ensley furnaces of the company are on basic iron. Seventeen furnaces are in operation; of this number eight are on foundry, seven on basic, one on recarburizing iron and one on ferro-manganese.

Prices per gross ton f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$15.50
No. 1 fdy., 2.25 to 2.75 sil.	16.00
Basic	\$15.00 to 16.00

Finished Steel.—Inquiries last week

were the heaviest for any week this month. Bookings of bars, plates, shapes and some other lines are ahead of those of two months ago. Mill operations were increased last week, following a slight let up in the previous week. Prices are unchanged but show more firmness than for some time. Structural steel fabricators and reinforcing bar manufacturers are fairly busy. The Ingalls Iron Works Co. has an order for 510 tons for a new power house at Tuscaloosa for the Gulf States Paper Corporation. The Tennessee company is again operating six open-hearth furnaces at Ensley, following a shutdown of a few days. Six are also in operation at Fairfield. The Gulf States Steel Co. continues with three at Alabama City.

Cast Iron Pipe.—Pressure pipe makers have experienced another quiet week in sales. The National Cast Iron Pipe Co. has an order for 250 tons for Grosse Isle, Mich., and the American Cast Iron Pipe Co. will make shipments of 100 tons each to Burbank, Cal., and Waukesha, Wis.

Warehouse Prices, f.o.b. Cincinnati

Seamless steel boiler tubes, 2-in.	19.00
4-in.	39.00

All new business up for figures lately has been in small tonnages. Shipments are going forward at a good rate. Quotations are unchanged from a base of \$34 to \$35 on 6-in. and larger sizes.

Coke.—The coke situation shows little change. Spot sales are being made from day to day, but the volume is not large. Quotations continue at \$5 for both spot and contract.

Old Material.—The market continues dormant. A few sales are being made in small tonnages. Owing

to the lack of activity, prices have undergone very little change. Scrap steel rail and No. 1 cast are the main items in demand.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$8.50 to	\$9.00
Scrap steel rails.....	11.00 to	11.50
Short shoveling turnings...	7.50 to	8.00
Cast iron borings.....		8.00
Stove plate		13.50
Steel axles	19.00 to	20.00
Iron axles	20.00 to	21.00
No. 1 railroad wrought....	10.00 to	10.50
Rails for rolling.....		13.00
No. 1 cast		14.25
Tramcar wheels	12.50 to	13.50
Cast iron carwheels.....	12.00 to	13.00
Cast iron borings, chem..	13.50 to	14.00

on old contracts, with other mills at \$14.25 to \$14.50, as shipments have been stopped by some of these buyers and restricted by others. Dealers are inclined to revamp their entire price list in line with the lower price on heavy melting steel, but have not made actual sales at the new quotations. Other material has not been sold in tonnage during the week.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Buffalo

Heavy Pig Iron Shipments by Barge Canal—July Sales Exceed Expectations—Scrap Market Easier

BUFFALO, July 24.—July sales of pig iron have exceeded predictions by a substantial margin. Most business has been in lots of less than 1000 tons, but the aggregate of the many small orders has kept the month's output moving steadily. Canal shipments have been heavy and more tonnage is offered to barge operators for August. One 1000-ton lot was sold down State last week. Buffalo prices are a shade stronger; \$17 is the district price on low silicon foundry and \$17.50 on malleable. A maximum shading of 50c. in each case is said to be the lowest quotation. Operation is unchanged.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.....	\$17.00
No. 2X fdy., sil. 2.25 to 2.75.....	17.50
No. 1X fdy., sil. 2.75 to 3.25.....	18.50
Malleable, sil. up to 2.25.....	17.50
Basic	\$16.50 to 17.00
Lake Superior charcoal...	27.28

Finished Steel.—Steel mill operations, which were reduced during the first half of July, show an increase for the last half of the month, now running a little better than 75 per cent of capacity. Forward bookings are fair in some lines, particularly for full finished sheets and structural shapes, but in other lines shipments are about equal to orders. The day-to-day volume of business is taking full production of mills in the territory. Bethlehem Steel Co. has started production of nearly 7000 tons of structural for the new Rand Building

here, and its subsidiary will fabricate the tonnage. Reinforcing bar sales have been good this month, with the price a little lower and occasionally touching 1.90c., Buffalo. Bar demand is fair. Wire is quieter after two very good months, but operation of mills is on the old scale. Sheet prices are a little steadier, with dips below 2.70c. on black less frequent.

Old Material.—Two Buffalo jobbers are reported as having sold 20,000 tons of No. 1 heavy melting steel for district delivery at \$13.75. This is 50c. under the last sale to the same buyer. There is large tonnage of heavy melting steel still to be shipped

Canada

Toronto Building Takes 10,000 Tons of Steel—Structural Demand Active—Pig Iron Business Steady

TORONTO, ONT., July 24.—While foundry and malleable pig iron sales in the Canadian markets have failed to gain over those of the week preceding, they were much better than those of the first week or 10 days of this month. Business is 10 to 15 per cent better than that of a year ago. Advance buying is practically at a standstill, but inquiries are coming out, and about 1000 tons was sold during the week for delivery up to the end of September. With foundries, sanitary ware and radiator manufacturing concerns and various other pig iron consuming interests operating their plants at between 70 and 100 per cent, prospects are good for a continued demand for foundry and malleable iron for some time to come. Local blast furnace representatives do not look for stronger prices here un-

til those in the United States markets tend to stiffen.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75..	\$23.10 to \$23.60
No. 2 fdy., sil. 1.75 to 2.25..	23.10 to 23.60

Malleable	24.50 to 25.00
Basic	23.50 to 24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Canadian building trades are experiencing one of the best years in their history and as a result the demand for steel is also a record one. The Dominion Bridge Co. has received a contract for about 10,000 tons of structural steel for the new building at College and Yonge Streets, Toronto, for the T. Eaton Co.; the

Disher Steel Construction Co. has a contract for 2000 tons of steel for the new Evening Telegram Building, Toronto; contracts for 400 tons for a hotel at Brockville, Ont., and 200 tons for garage for Connaught Motor Sales, Hamilton, Ont., have been awarded. Approximately 2000 tons of structural steel will be required for new factory building on Coxwell Avenue, Toronto, Ont., for Service Station Equipment Co.; 400 tons will be needed for a theater and office building at Outremont, Que., for F. Trudeau.

Old Material.—Business in this market is slow. Consumers are showing interest in immediate needs only. Trading between dealers has dropped off owing to the slump in resale demand, but yards are well supplied for present needs. In the Montreal market dealers report a good demand for

wrought iron and steel axles and are offering \$22 and \$20 per gross ton respectively for these materials, but little is coming out. Other materials are moving slowly. Prices are unchanged at Toronto and Montreal.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.....	\$9.00	\$7.00
Rails, scrap.....	10.00	9.00
No. 1 wrought.....	9.00	11.00

inquiry of importance is, before the trade for figures. This involves 4500 tons of material for water main transmission lines in Oakland for the East Bay Municipal Utility District. Quotations range from 2.20c. to 2.30c., c.i.f.

Shapes.—Structural steel shapes continue in active demand and awards this week exceeded 1000 tons. The California Steel Co. took 180 tons for an automobile service building in Oakland and the Herrick Iron Works took 170 tons for a bridge over Alameda Creek in Oakland. Bids are being taken on another hangar for the Port Commission in Oakland, involving 250 tons. Pending business totals well over 11,000 tons. Plain material continues firm at 2.35c., c.i.f.

Cast Iron Pipe.—Awards of cast iron pipe this week were heavier than usual and totaled over 3000 tons. Los Angeles placed 844 tons of 8-in. class 350 pipe with the Pacific States Cast Iron Pipe Co., 422 tons of 8-in. class 350 pipe with Jones, Lyman & Co., and 855 tons of 12-in. class 350 pipe with the American Cast Iron Pipe Co. C. H. Merrill, Santa Monica, Cal., took 294 tons of 4 to 12-in. class B pipe for street improvements in Huntington Park, Cal.. Pending business is confined to one or two projects totaling less than 1000 tons, with the exception of 22,000 tons for the East Bay Municipal Utility District, bids on which will be opened Aug. 17.

Standard Pipe.—Movement of standard pipe and oil country goods of late has been limited to unimportant lots. Los Angeles opened bids this week on 110 tons of 1-in. galvanized pipe and 75,000 ft. of 1¼-in. galvanized pipe. Inquiries for line pipe involve only small tonnages.

San Francisco

Steel Demand Well Sustained—Water Line Calls for 4500 Tons of Plates

SAN FRANCISCO, July 21 (By Air Mail).—Demand for steel products is well sustained and bookings during the week included some fair-sized tonnages. Among the more important awards were 400 tons of shapes for a chemical plant addition at Tacoma, placed with the Star Iron & Steel Co. and 400 tons of reinforcing bars for highway work in Ventura County, Cal., placed with an unnamed interest. Considerable new work has come up for figures during the past 10 days and the outlook for the rest of the year is good. Structural steel shapes and reinforcing bars continue the most active products.

Pig Iron.—Movement of foundry iron has been confined to unimportant lots and new inquiries involve small tonnages only. Operations among the jobbing foundries continue on a limited scale. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic.....	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25.....	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25.....	24.00 to 25.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar awards during the past week totaled over 1800 tons and included 400 tons for a warehouse in Seattle for Frederick & Nelson, divided between the Pacific Coast Steel Co. and the Northwest Steel Rolling Mills, and 170 tons for a school administration building in Oakland, placed with the Pacific Coast Steel Co. Bids were opened this week on 2288 tons for a drainage improvement project in Los Angeles and on

300 tons for a department store at Everett, Wash.

Plates.—The plate market on the coast has been exceptionally quiet during the past month and only one

Pacific Northwest

Prices of Plates, Sheets and Wire Products Weaker—Coast Business Quieter

SEATTLE, July 21 (By Air Mail).—Developments of the past week indicate that the threatened war in rail and water freight rates from Eastern to Pacific Coast points will soon be terminated. It is understood that the Illinois Central Railroad and the Redwood Lines, which made a rail and water rate of 61c. per 100 lb. from points in Illinois and Indiana to California points, have petitioned the Interstate Commerce Commission for permission to withdraw this rate, and it is very likely it will be granted. Strong pressure from other rail and water lines, with threats that if the low rate was not withdrawn a general war in rates would be started, has had its effect.

Steel business is quiet, with prices showing signs of weakness in practically all lines. This is particularly true of plates, sheets and wire products.

The Alaska salmon pack this year

will be the heaviest in any one year since 1926, and this is also true of berries and other fruits. This means a heavy consumption of tin plate on the coast, and greater activity among the can making plants than for several years.

Pig Iron.—Demand is for small lots only, with prices in this territory unchanged. Not enough iron is being sold here to establish a market. No. 2 foundry and Utah basic are quoted at \$24 to \$25 gross tons, Seattle.

Shapes.—The local market is quiet, but prices seem to be holding. A

bridge at Nisqually was taken by the Pacific Car & Foundry Co. A railroad span at Cle Elum went to an Eastern fabricator. Bids are to be opened on July 27 for about 190 tons for the local Second Avenue extension, and on Aug. 14 for about 700 to 1000 tons of State bridge work. The local Olympic Hotel is to add 400 rooms, and bids will be asked shortly for the steel, the tonnage for which has not been estimated. Shapes are quoted at 2.35c., Seattle.

Plates.—These are the quietest items on the whole steel list. No large contracts have been placed for some time, and no large work is in sight. Tank quality plates are quoted at 2.20c. to 2.25c., but the lower price is not general.

Reinforcing Bars.—Only a fair amount of new work is being placed. The Northwest Rolling Mills, Inc., has taken 150 tons for the local Grimshaw

garage, 350 tons for the Benjamin Franklin apartments, also 250 tons of wooden pipe bands. Reinforcing steel bars are quoted at 2.20c. to 3c., Seattle.

Railroad Spikes.—The Pacific Coast Forge Co., Seattle, has taken 2000 kegs of standard spikes for the Great Northern Railway and 1000 kegs for the Northern Pacific. Standard spikes are \$2.90 to \$3 per 100 lb., Seattle.

Sheets.—Local prices on sheets are weak, and very little new business is coming out. Galvanized sheets, 24 gage, are 4.10c. to 4.15c., No. 24 black are 3.20c. to 3.25c., and No. 10 blue annealed are 2.57c. to 2.67c. at Seattle.

Wire Products.—The local market on wire products is somewhat disturbed and prices are lower, wire nails being about 25c. lower. Wire nails are now obtainable at \$3.25 per keg, base, and bright plain wire at \$3 per 100 lb., base, at Seattle.

Boston

6500 Tons of Scrap Being Exported to Italy—Pig Iron Prices Weak

BOSTON, July 24.—The feature of the pig iron market is the weakness of New York State furnace prices. Some Buffalo interests still report a base price of \$17 a ton, furnace, but it is evident that no sales of No. 2 plain have been made in New England recently at more than \$16.50 a ton, furnace, and there have been numerous sales at \$16, while No. 2X has been sold at \$16 and \$16.50. It is equally certain that other New York State interests are offering and have accepted business within the past 10 days on a delivered basis equivalent to \$16.50 a ton, Buffalo, for No. 2X and \$17 for No. 1X, for delivery over the remainder of the year. Another feature of the market is that quite a little western Pennsylvania iron is selling at prices higher than the prevailing Buf-

falo equivalent for delivery on and after Aug. 4, when a new rate, \$4.91, equivalent to the Buffalo all-rail freight rate, goes into effect. Eastern Pennsylvania, Virginia and Alabama irons, despite the higher delivered cost, are more in demand by foundries having trouble with mixtures. Sales the past week aggregated slightly better than 4000 tons, of which the Mystic Iron Works took 2200 tons.

Foundry iron prices per gross ton deliv'd to most New England points:
*Buffalo, sil. 1.75 to 2.25.. \$20.91 to \$21.41
*Buffalo, sil. 2.25 to 2.75.. 21.41 to 21.91
†Buffalo, sil. 1.75 to 2.25.. 19.78 to 20.28
†Buffalo, sil. 2.25 to 2.75.. 20.28 to 20.78
East. Penn., sil. 1.75 to 2.25 23.15 to 23.65
East. Penn., sil. 2.25 to 2.75 23.65 to 24.15
Va., sil. 1.75 to 2.25..... 25.71
Va., sil. 2.25 to 2.75..... 26.21
Ala., sil. 1.75 to 2.25..... 22.41 to 24.27
Ala., sil. 2.25 to 2.75..... 22.91 to 24.77

Freight rates: \$4.91 all rail and \$3.78 rail and water from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.
*All rail rate. †Rail and water rate.

Coke.—Indications are the New England Coal & Coke Co. and the Providence Gas Co. will make no change Aug. 1 in their price on by-product foundry coke, which is \$11 a ton, delivered within a \$3.10 freight rate zone. Both companies report July shipments will be better than those of last July, but below the average for a period of years. Most of the New England foundries continue to order in small tonnages, but are ordering more often, indicating some improvement in the melt of iron.

Shapes and Plates.—The fabricated steel situation remains in a firm position. Most fabricators have sufficient business on their books to maintain present operations for several months, and indications are that sufficient tonnage will be available this fall to carry them into the first quarter of 1929. The market for standard shapes

and plates is 1.90c., base Pittsburgh, but some of the largest consumers are still protected on third quarter business at 1.85c.

Cast Iron Pipe.—Lynn, Mass., has awarded 250 tons of 6-in. and 8-in. pipe to the Warren Foundry & Pipe Co, Lowell, Mass., closed bids July 23 on 100 tons of 12-in. pipe. No other open municipal business is reported. Private bookings of tonnages are good for this time of the year. Prices on small pipe are firm, but on large diameters prices are easy. The range for 4-in. pipe is \$45.10 to \$46.10 a ton, delivered common Boston freight rate points, and for 6-in. to 12-in. \$41.10 to \$42.10. The usual \$5 differential is asked on class A and gas pipe.

Warehouse Business.—As July draws to a close, some seasonal falling off in the movement of iron and steel out of warehouses is reported. Business, however, continues ahead of last year. The last advance by mills in prices of bars, shapes and plates has checked warehouse price cutting. There is some talk of a possible advance in warehouse prices before the close of this quarter.

Old Material.—Quotations here for old material tend downward because of the prices steel mills are willing to pay. Shafting, T and girder rails, cast iron borings for steel mill use and railroad wrought are actually lower, while inside prices are paid more often than outside prices for other kinds of scrap. Local dealers report difficulty in securing material, prices being unattractive to owners. Some long bundled skeleton for New England consumption is moving at \$6.50 a ton on cars and for Pennsylvania consumption at \$5 to \$5.50. One sale of girder rails is reported at \$7.10 a ton on cars, but the general range of prices is \$7.25 to \$7.50. Heavy melting steel is in lighter supply than it has been in months. There is quite a little activity in the local export market. Exporters are paying around \$9.25 a ton on dock here for No. 1 steel, and around \$8.50 for No. 2 steel. A boat will shortly call here for 3500 to 4000 tons of scrap for shipment to Italy, the first consignment to that country in a long time. The boat's total cargo will be around 6500 tons, 3000 tons to be taken on at another port.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$8.00 to \$8.50

St. Louis

Pig Iron Buying Light as Uncertainty Over Prices Continues—Scrap Market Is Weaker

ST. LOUIS, July 24.—Buying of pig iron continues light. Sales of the St. Louis Gas & Coke Corporation totaled about 2000 tons, the largest lot of which was 400 tons to a St. Louis melter. Most of the business was in carload lots. Melters are demanding immediate shipment, which makers regard as an indication of light stocks and an early resumption of quantity buying. The unsettled price situation is believed to be causing melters to withhold buying except for immediate needs, as they seem to be uncertain whether there will be further price reduction as a result of competition from Lake shippers in the Chicago market. The local maker has made no formal reduction in price, but is meeting all competition.

Prices per gross ton at St. Louis:

N'th'n No. 2 fdy., deliv'd St. Louis.	19.66
Southern No. 2 fdy., deliv'd.	19.92
Northern malleable, deliv'd.	19.66
Northern basic, deliv'd.	19.66

Freight rates: 81c. Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Finished Steel.—The Granite City Steel Co. continues to operate all of its rolling mill units at practically 100 per cent of capacity, except that galvanized sheets are at a rate of about 80 per cent. Tin plate is by far the most active of all products. Tank plate demand shows slight falling off owing to limited lettings of cars and oil storage tanks.

Coke.—The usual July dullness marks the coke market. Dealers have shown only slight interest in taking on fall supplies of domestic grades. The demand for industrial grades in this district is very light. Prices are unchanged.

Old Material.—The old material market is weaker and some items are

lower as a result of lack of buying by consumers who are curtailing operations. About the only activity is in rails for rolling, as mills making reinforcing bars are enjoying a satisfactory trade, but even the price of this item is 25c. a ton lower. Heavy melting steel, heavy shoveling steel, No. 2 railroad wrought and cast iron borings are 25c. a ton less than in the preceding week; stove plate is 50c. less. Iron car axles, for which the demand, although small, is greater than the supply, are 25c. a ton higher. Dealers are buying virtually nothing except items needed to fill contracts. Railroad lists include: Chicago, Burlington & Quincy, 5690 tons; Atchison, Topeka & Santa Fe, 4000 tons; Nickel

Plate, 950 tons, and Standard Oil Co. of Indiana (Woodriver, Ill.), 100 tons.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

Heavy melting steel.....	\$10.50 to \$11.00
No. 1 locomotive tires....	12.00 to 12.50
Heavy shoveling steel....	10.50 to 11.00
Miscell. stand.-sec. rails, includ'g frogs, sw'ches and guards, cut apart..	12.00 to 12.50
Railroad springs.....	13.00 to 13.50
Bundled sheets.....	8.50 to 9.00
No. 2 railroad wrought....	10.75 to 11.25
No. 1 busheling.....	9.25 to 9.75
Cast iron borings.....	8.25 to 8.75
Iron rails.....	13.00 to 13.50
Rails for rolling.....	12.75 to 13.25
Machine shop turnings....	6.25 to 6.75
Steel car axles.....	16.75 to 17.25
Iron car axles.....	25.75 to 26.25
Wrot. iron bars and trans.	18.00 to 18.50
No. 1 railroad wrought....	9.00 to 9.50
Steel rails, less than 3 ft..	15.00 to 15.50
Steel angle bars.....	11.50 to 12.00
Cast iron carwheels.....	12.75 to 13.25
No. 1 machinery cast....	13.00 to 13.50
Railroad malleable.....	11.25 to 11.75
No. 1 railroad cast.....	13.00 to 13.50
Stove plate.....	10.50 to 11.00
Agricuit. malleable.....	12.00 to 12.50
Relay. rails, 60 lb. and under.....	20.50 to 23.50
Relay. rails, 70 lb. and over.....	26.50 to 29.00

Youngstown

Steel Makers Encouraged by July Developments—Strip and Tin Plate Capacity Very Active

YOUNGSTOWN, July 24.—Continued favorable reports feature the iron and steel market situation in northeastern Ohio. The Republic Iron & Steel Co. has advanced its average production in the Youngstown district to 80 per cent by reason of the near-capacity operating rate of its Warren plant, which produces sheets, strips and tin plate. In this area strip and tin plate capacity is active, averaging above 90 per cent. Makers of full-finished automobile sheets are obliged to work extra turns because of sustained demands from the automobile trade and reduction in output, caused by excessive humidity. Open-hearth furnace schedules have gained to 39, an increase of one from last week. There is a temporary loss this week of two pipe mills, with 12 of 20 under power, but new business now going through sales departments will produce an increase in such scheduling.

Steel makers in this area are encouraged by developments of recent weeks and look for maintenance of production at the current rate or close thereto through the summer months. During the past two weeks there has been some curtailment in output of hot mills because of the intense humidity.

It is expected that the price structure will strengthen in the fall, as the general business situation improves. In the meantime, the market in flat-rolled steel is irregular, especially in steel sheets, with minimum prices at 2.60 to 2.65c for black sheets; 2c for blue annealed and 3.50c for galvanized, base gages. New business is being taken in merchant steel bars and plates at 1.85c per lb.

Improvement in line pipe demand

within recent weeks constitutes one of the features of the market, with the Republic Iron & Steel Co. and the Sheet & Tube company among the principal beneficiaries. The Republic company is reported to have taken 50 miles of lapweld pipe for a Southwestern company. In addition to the business which has actually been placed, other important inquiries are before the trade and it is expected they will be translated into orders this year.

Less Ore Consumed in June

Iron ore consumed in June is reported by the Lake Superior Iron Ore Association at 4,667,493 gross tons, compared with 4,947,768 tons in May. The decrease of 280,275 tons was nearly 6 per cent. The consumption compares with 4,530,565 tons in June, 1927. Figures represent a total of 271 furnaces, of which 173 were in blast on the last day of May and 163 on the last day of June.

Ore on hand at furnaces on July 1 is reported at 17,912,817 tons. Ore at Lake Erie docks at the same date is given as 5,067,786 tons, making a total available stock of 22,980,603 tons. This compares with 26,972,594 tons of ore on hand July 1, 1927.

Apparent consumption of babbitt metal in June is reported by the Department of Commerce at 4,731,023 lb. This is an increase of 3 per cent over the May total of 4,606,899 lb., but a decrease of 2½ per cent from the 4,854,653 lb. of June, 1927. For the first half-year the total was 28,507,097 lb., a decline of 8½ per cent from the 31,130,692 lb. of last year.

Warehouse Prices, f.o.b. St. Louis

*Refinery quotation; delivered price ¼c. higher.

Copper.—A small amount of buying for spot and August delivery has been done in the past week at unchanged prices, namely 14.75c. per lb., delivered Connecticut Valley, for electrolytic or Lake copper. Consumers are showing almost no interest in supplies for September, a situation not pleasing to the larger producers, who fear a last-minute rush to buy, which in the present firm

market might have a tendency to advance prices. Present prices are quite satisfactory to the producers, who prefer a steady rather than an advancing market. Shipments are being made at an undiminished rate both to domestic and foreign users.

Tin.—Although spot tin was sold today at 48c. per lb., an advance of ¼c. in the week since July 17, the strength was more attributable to a stronger market in London and in the Far East than to activity here. Sales in the last calendar week in this market did not exceed 1000 tons, while the total for Monday and today was little more than 600 tons.

The stronger situation in London is ascribed to the fact that options on a large tonnage are due in August and September. In the London market the advance in the week has been about £4, and a like advance has occurred in the Singapore price. Today's London prices were £217 10s. for spot standard, £214 10s. for future standard, £220 10s. for spot Straits. The Singapore price today was £219 15s.

Lead.—There is a moderately active demand for lead, with July and August deliveries mainly called for. Some inquiry for September has developed, but not much business has

Metals from New York Warehouse

Brass.....	25.62½c.
Copper.....	26.50c.
Brazed Brass Tubes.....	27.25c.
Brass Rods.....	17.00c.

been closed. The St. Louis price is 6c., with slight premiums being asked in some instances. The New York market continues at 6.20c., which is the contract price of the American Smelting & Refining Co.

Zinc.—For prompt shipment, 6.20c., East St. Louis, is asked for prime Western zinc, but 6.25c. has been paid for August. The market has been rather quiet during the last week. The price of ore at Joplin remains unchanged at \$40 per ton. Production last week was 12,000 tons, the same as the week before.

Antimony.—Sales of parcels on dock here brought weakness in the antimony market within the past few days. The market declined to 9.37½c. per lb., New York, duty paid. Futures are freely offered at 9.62½c., duty paid.

Aluminum.—Virgin metal, 98 to 99 per cent, is offered at 23.90c. per lb., delivered.

Nickel.—Ingot nickel is quoted at 35c. per lb., shot nickel at 36c. and electrolytic at 37c.

Non-Ferrous Metals at Chicago

CHICAGO, July 24.—Tin has advanced and lead has declined. There has been considerable business in tin in this country, but the advance in price is attributed largely to speculation in London. Copper and zinc are being bought for nearby delivery only. Old metal prices are unchanged.

Prices, per lb., in carload lots:
Lake copper, 14.87½c.; tin, 48.75c.; lead, 6.10c.; zinc, 6.30c.; in less-than-carload lots, antimony, 11.25c. On old metals we quote copper wire, crucible shapes and copper clips, 10.75c.; copper bottoms, 9.75c.; red brass, 9.50c.; yellow brass, 7.25c.; lead pipe, 4.75c.; zinc, 3.50c.; pewter, No. 1, 30c.; tin foil, 36.25c.; block tin, 45.25c.; aluminum, 12c.; all being dealers' prices for less-than-carload lots.

Menominee Range Meeting

The Iron and Steel Division of the American Institute of Mining and Metallurgical Engineers will meet jointly with the Lake Superior Mining Institute, Sept. 7 and 8. The meeting will be largely social and will include visits to mines and works but a brief technical session will be held.

On the morning of Sept. 7 the party will leave the Crystal Inn, Crystal Falls, Mich., for Alpha and Caspion, visiting mines and meeting for lunch at the Caspion Club. After lunch mines in the vicinity of Iron River will be visited. There will be a barbecue supper at Fortune Lake and a business session of the Lake Superior Mining Institute with a short technical session.

On Sept. 8 the party will meet at Iron Mountain for visit to mines and power plants.

The conduct of the meeting will be in the hands of the Lake Superior

Mining Institute, as host, with C. H. Baxter, president, and A. J. Yungbluth, secretary. On arrival the members will be given a specially prepared guide book to the field.

Philadelphia Meeting of Institute of Metals

The Institute of Metals Division (American Institute of Mining and Metallurgical Engineers) will hold its fall meeting at Philadelphia in the same week that the American Society for Steel Treating and the American Welding Society meet. The institute sessions will be held Oct. 9-10-11 at Hotel Benjamin, which will be headquarters.

The program includes the following papers:

Gases in Casting Copper—by O. W. Ellis.

Diffusion of Zinc into Copper—by S. L. Hoyt.

Less Common Elements in the Electrical Industry—by T. S. Fuller.

Papers on temperature coefficient of Brinell measurements and hardenable copper and silver alloys.

Treatment and Structure of Magnesium Alloys—by John A. Gann.

Notes on Smoothing and Etching—by H. B. Pulsifer.

X-Ray Study of Cold Work and Annealing—by Ancel St. John.

Tempering of Steel—by F. F. Lucas.

Neumann Bands in Ferrite—by C. H. Mathewson.

Dr. F. M. Becket, vice-president Union Carbide Co., will speak at the institute's dinner on chromium alloys.

Effect of Cold Rolling and Heat Treatment upon the Physical Properties of Britannic Metal—by B. Egberg and H. B. Smith.

High Strength Gold Alloys for Jewelry—by E. M. Wise. Stability of Aluminum and Magnesium Copper Alloys—by A. J. Lyon.

Papers on Permanent Mold Casting and Vacuum Method for the Casting Metal.

Research Fellowship on Low-Temperature Tar

To determine the composition of tar produced in the low-temperature carbonization of Eastern coals, Kenneth M. Irey, Monmouth, Ill., has been appointed to the National Coal Association research Fellowship at the Carnegie Institute of Technology and the United States Bureau of Mines. The work will be along lines similar to those developed by preceding Coal Association fellowships, working on low-temperature tar from a Western coal. It is recognized that the success of low-temperature carbonization of any coal depends upon profitable disposal of the smokeless fuel and the by-products.

Industrial utilization of low-tem-

perature tar cannot be developed without knowledge of its composition. Three successive National Coal Association fellowships working under Dr. R. L. Brown, organic chemist, Bureau of Mines, have succeeded in determining the amount of motor fuel and its character in the coal tar from Utah coal. They have, likewise, worked out the proportion of tar acids and acid resins, which are valuable constituents for timber preservatives.

Results of the 1927 fellowship have shown that considerable percentages of heavy oils and waxes can be isolated from the Utah coal tar. These present interesting possibilities for technical utilization. Due to the present interest in the construction of several large-scale low-temperature carbonization plants in the Eastern United States, it was deemed important to make a similar thorough examination of the composition of low-temperature tar from eastern coals.

Germany Leading Seller of Electrical Machinery

Of the five largest machinery exporting countries, Germany was by far the leader in 1913, according to figures in a recent copy of the London *Economist*. Rapid strides have been made by that country in recent years in overcoming the setback occasioned by the World War, with the result that in 1927 Germany took second position from the United States and exported within 2½ per cent of as much as Great Britain, which recently has stood first. The figures given in the table are in thousands of pounds sterling and show that each of the three leading countries provided about 30 per cent in 1927 of the total exports of the five countries shown.

MACHINERY EXPORTS, IN THOUSANDS OF POUNDS STERLING

	1913	1926	1927
Great Britain...	7,656	18,174	18,800
United States...	5,790	17,600	17,600
Germany	15,888	17,300	18,350
France	2,185	3,880	2,760
Switzerland ...	1,240	2,180	2,850
Total	32,759	59,134	60,360

American ships carried 35 per cent of the exports and 33.2 per cent of the imports entering into our waterborne commerce in 1927, according to a statement of the Department of Commerce. In both cases there was an increase over the proportion carried by American ships in the preceding year, which was 34.6 per cent of the exports and 30.7 per cent of the imports.

Average weekly earnings in New York State factories in January are reported by the Industrial Commissioner at \$29.22. With the exception of last November, this is the lowest figure since July. It is 8c. below the average for the 12 months of 1927 and compares with \$29.57 in December and \$29.52 in January of that year.

PERSONAL

DR. JOHN JOHNSTON, director of research and technology for the United States Steel Corporation; C. A. REINHARDT, chief metallurgist Youngstown Sheet & Tube Co.; DR. J. S. UNGER, manager of the research bureau of the Carnegie Steel Co., and HOMER D. WILLIAMS, president Pittsburgh Steel Co., have been invited by President THOMAS S. BAKER of the Carnegie Institute of Technology, Pittsburgh, to become members of the advisory board of the department of metallurgical engineering at that institution. The board is made up of about 25 steel company executives and metallurgists and is concerned primarily with the development of metallurgical research now carried on jointly by the Carnegie Institute and the Bureau of Mines. T. D. LYNCH, consulting metallurgical engineer for the Westinghouse Electric & Mfg. Co., East Pittsburgh, is chairman of the board for the coming year, and for this period the board has selected a program of five investigations in ferrous metallurgy to be made by research fellows under the auspices of the Institute and the Bureau of Mines. An advisory board of coal mine operators and engineers, which occupies a similar relationship to the department of mining engineering, has selected six problems in fuel chemistry for investigation by six research fellows during the same time.

W. O. RENKIN has been appointed manager of the industrial furnace department of the Combustion Engineering Corporation, 200 Madison Avenue, New York, and will assume his new duties Aug. 1. He is considered a pioneer in the application of pulverized fuel to metallurgical and industrial furnaces, having devoted the past 15 years to this particular field of engineering.

MURRAY N. BILLINGS, assistant traffic manager Illinois Steel Co., Chicago, has been appointed traffic manager, succeeding F. T. BENTLEY, who has retired from active service and has been made consultant traffic manager.

H. V. BARR, formerly associated with the Heald Machine Co., Worcester, Mass., is now Connecticut representative of Stedfast & Roulston, Inc., Boston.

CHARLES N. TEETOR has been elected president of the Perfect Circle Co., Hagerstown, Ind., following consolidation of that company with the General Piston Ring Co., Tipton, Ind. Other officers of the company are RALPH TEETOR, first vice-president; LOTNAIR TEETOR, second vice-president; LEWIS S. BOWMAN, secretary, and RAY TEETOR, treasurer.

JOHN J. LOUGHRAN has resigned as chief engineer of the Adriance Machine Works, Brooklyn, to become chief engineer at the Pottstown, Pa., plant of the Doehler Die Castings Co.

HAROLD E. BUTCHER, recently vice-president Champion Spark Plug Co., has been elected second vice-president of the Edward G. Budd Mfg. Co., Philadelphia. This office was recently created by a change in the company's by-laws which were amended at the same time to increase the membership of the board of directors from 12 to 15.

W. R. STRICKLAND, assistant chief engineer of the Cadillac Motor Car Co., Detroit, was nominated for the presidency of the Society of Automotive Engineers at a meeting held recently in Quebec.

LAWRENCE M. BRILE, who has been vice-president in charge of sales for the Fairmont Mfg. Co., Fairmont, W. Va., was elected president of the company at a recent board meeting, to succeed W. J. ADAM, who has resigned. DR. ROBERT J. ANDERSON has been elected vice-president and is in charge of production at the company's aluminum rolling mills at Fairmont. JOHN N. BRANZA, who has been manager of the Cleveland office, has been named sales manager and T. A. LYNCH has been appointed assistant to the president. WILLIAM J. LANGE, metallurgist, has been made technical supervisor.

J. B. HAMILTON, formerly associated with Wickes Brothers, Jersey City, has purchased an interest in and been elected vice-president of the Bertolette Machine Tool Co., Jersey City, dealer in new and used machine tools. The company has established a department to handle air compressors and contractors' equipment.

JOHN W. DAVIS, JR., Galveston, Tex., has been appointed assistant trade commissioner and assigned to Buenos Aires, Argentina.

FRANK MESSENGER, Paterson, N. J., has been appointed assistant trade commissioner at London, England.

SAM TOUR has resigned as metallurgist of the Doehler Die Casting Co., Batavia, N. Y., and has been succeeded by W. G. JOHNSTON.

HERBERT HOOVER, Republican nominee for President of the United States, has been awarded the Louis Livingston Seaman medal of the American Museum of Safety, New York, awarded for the best record in

the saving of life in the field of sanitation and accidents, for "great public service from the standpoint of human values," and particularly for "conspicuous work in the Mississippi flood relief." The latest previous recipient was the late Judge E. H. Gary, in 1922.

FRED JOHNSON, who has been manager of the St. Louis district sales office of the Wagner Electric Corporation, St. Louis, for 21 years, has been transferred to Los Angeles and is now manager of the company's office in that city. He has been connected with the electrical industry since 1898, having started out in the sales department of the Martin J. In-sull Co., Chicago. In 1899 he became associated with the General Incandescent Arc Light Co., New York, and the following year became manager of the Chicago office, retaining this position until he went with the Wagner corporation. He has been succeeded at St. Louis by ALEX L. MILTENBERGER, heretofore the company's Pacific Coast manager, with headquarters at San Francisco. Mr. Miltenberger was graduated from Columbia University in 1909 and has been connected with the Wagner organization ever since, first in the St. Louis sales department and since 1920 as Pacific Coast manager.

L. E. GRIFFITH, New York district manager for the Riley Stoker Corporation, Worcester, Mass., has been appointed sales manager of the company, succeeding the late WILLIAM PESTEL. Mr. Griffith was graduated from Lafayette College, Easton, Pa., in 1912, and his first business connection was with the Thompson-Starrett Co., first at New York and later at Chicago. After a short affiliation with the Babcock & Wilcox Co., New York, he became identified with the United Machine & Mfg. Co. and was president of that company when it was absorbed by the Riley corporation. W. L. SCHULTZ, for the past few years sales representative in the Riley New York office, has been appointed district manager to succeed Mr. Griffith.

C. M. RUTLEDGE, for the last nine years identified with the Columbia Tool Steel Co., first as sales representative and later as assistant Chicago district manager, has become associated with the Chicago office of the Vanadium-Alloys Steel Corporation, Latrobe, Pa.

AVERY C. ADAMS, formerly assistant general sales manager for the Trumbull Steel Co., Warren, Ohio, and more recently associated with the Republic Iron & Steel Co., has been appointed assistant to the president of the General Fireproofing Co., Youngstown.

W. G. EDMONDSON, recently assistant engineer of motive power of the Reading Co., has been appointed

works manager for the American Abrasive Metals Co., Irvington, N. J.

J. M. RANKIN, associated with the Bessemer Gas Engine Co., Baltimore, has been transferred to Washington, where the company has opened an engineering sales office.

J. E. ROWE, who has been director of extension and head of the department of mathematics at the College of William and Mary, Williamsburg, Va., has resigned to become president of the Clarkson Memorial Institute of Technology, Potsdam, N. Y.

J. W. BARRITT, formerly supervisor of apprentices at the South Philadelphia works of the Westinghouse Electric & Mfg. Co., will open a private engineering school at 1003 Lafayette Avenue, Moore, Pa., on Oct. 1, to be known as the Central Technical Institute.

WILLIAM F. MERRILL, vice-president and general manager of Remington-Rand, Inc., Buffalo, has been elected president of that company, succeeding JAMES H. RAND, JR., who becomes chairman of the board. B. L. WINCHELL, who was formerly president of the Remington Typewriter Co., has been named chairman of the executive committee. F. W. YOUNGS, continues as general manager of plants, with headquarters at Utica, N. Y.

F. E. MOSKOVICS, president Stutz Motor Car Co., Indianapolis, and HAROLD C. STROTZ, manager of the F. B. Keech Co., Chicago, have been elected officers of the Faries Mfg. Co., Decatur, Ill., manufacturer of brass, bronze and aluminum castings, spinings and stampings and plating work, following a reorganization of the company. At that time, W. J. GRADY, president of the company, and associates acquired a large part of the original Faries family holdings, and Mr. Grady was re-elected president; Mr. Moskovics, vice-president; W. W. ELLISON, secretary, and G. S. FOSTER, assistant secretary and assistant treasurer.

C. C. HENDERSON, vice-president and treasurer Allegheny Steel Co., Breckenridge, Pa., sailed July 15 for Europe to be gone until early in September.

H. W. GRAHAM, recently appointed general metallurgist in charge of metallurgical, inspection and quality matters for the Jones & Laughlin Steel Corporation, Pittsburgh, has been with that organization since his graduation from Lehigh University in 1914. He started in the cold finishing department at the South Side works, subsequently going to the engineering department and the open-hearth department, and for three years was attached to the Eliza furnaces.

Appoint Secretary-Manager for Gray Iron Institute

At a meeting of the executive committee of the Gray Iron Institute, held in Cleveland, July 17, Arthur J. Tuscany was chosen secretary-manager. The institute was formally launched at a meeting held in Philadelphia, May 18, following a conference of the leaders of the industry, who met in Pittsburgh in March. The executive committee of the institute consists of the president, Walter L. Seelbach, Forest City-Walworth Run Foundries Co., Cleveland; vice-presi-

A. J. TUSCANY

dents, B. H. Johnson, Cresson-Morris Co., Philadelphia, and A. E. Hageboeck, Frank Foundries Corporation, Moline, Ill.; treasurer, H. S. Chafee, Builders' Iron Foundry, Providence; and John L. Carter, Barlow Foundry Co., Newark, N. J.

For the past six years Mr. Tuscany has been secretary-manager of the Ohio State Foundrymen's Association. Previous to that time he was treasurer, director of purchases and a member of the board of the Whitney Tractor Co., Cleveland. He joined the latter organization at the time of its consolidation with the Post Tractor Co., for which organization he had been sales manager and a director. He achieved his early experience with the Johns-Manville Co., first as secretary to the branch manager and later as purchasing officer, salesman and field manager.

Ottawa Sands Corporation, recently organized with \$500,000 capital stock as a division of Material Service Corporation, Conway Building, Chicago, is building a large steel molding sand plant at Ottawa, Ill. The new company will have a daily capacity of 45 cars when it starts operations. Henry Crown, president, Material Service Corporation, also heads the new company. A. B. Hewson, formerly vice-president, Ottawa Silica Molding Sand Co., will be in charge of sales for the new corporation. Sales agencies will be appointed in various parts of the country.

Ohio Foundrymen Meet Aug. 16 and 17

The annual convention of the Ohio State Foundrymen's Association will be held at Cedar Point, Ohio, Aug. 16 and 17. The program as so far arranged is as follows:

"The Required Foundry Knowledge on Foundry Sand," by H. W. Dietert, chief industrial research engineer, United States Radiator Corporation, Detroit.

"Merchandising Foundry Products," name of speaker not announced.

"Taxation and Public Expenditures and Their Relation to Ohio Business," by George B. Chandler, secretary Ohio Chamber of Commerce, Columbus.

"How the Industrial Insurance Rates Affect the Industry and the Individual Employer," by T. M. Merri-man, Columbus.

"What You Should Know About Industrial Claims," by H. P. Sutherland, Columbus.

"A Safety Program for Ohio Foundries," by Fred G. Lange, division of safety and hygiene, Industrial Commission of Ohio.

Increase in Boiler Orders

New orders for 1609 steel boilers, with 1,467,281 sq. ft. of heating surface, were placed in June, as reported to the Department of Commerce by 72 manufacturers. This is the highest total for several months. It compares with 1571 boilers and 1,456,278 sq. ft. in May and with 1542 boilers and 1,366,486 sq. ft. in June, 1927.

For the first half-year the total was 7780 boilers and 7,592,628 sq. ft. of heating surface, comparing with 8042 units and 8,272,957 sq. ft. last year. The decline, based on square feet, was 8 1/4 per cent.

David Lupton's Sons Co. Building Chicago Plant

Construction work is proceeding on the first unit of the new Chicago plant of the David Lupton's Sons Co., Philadelphia, manufacturer of steel windows. The first unit will be 150 x 500 ft. When other units are built the Chicago plant will be 500 x 1000 ft. The Chicago plant will include a fabricating shop and warehouse, giving the company two branches in addition to the main plant and warehouse in Philadelphia, the other plant being in Cleveland.

More than two-thirds of the American cutlery exports in 1927 consisted of safety razor blades, according to the Department of Commerce. Total shipments of blades made \$7,020,995, of \$10,232,632 total cutlery exports. The total showed a gain of 9 per cent over 1926, while safety razor blades gained 19 per cent.

OBITUARY

JUSTIN DAVID CROSBY, founder, president and treasurer of the J. D. Crosby Co., Pawtucket, R. I., whose death in that city on July 10 was mentioned in *THE IRON AGE* last week, had spent his entire business life in the steel and wire industry. He was born at Worcester, Mass., in 1862 and, after attending high school and business college in that city, he

J. D. CROSBY

was employed as a clerk in the plant of the Washburn Woven Wire Mfg. Co., with which company his father was associated at the time. He was identified with the Washburn organization for 23 years, serving in nearly every department and finally becoming superintendent. Upon leaving the company he was engaged in business on his own account for a short time. Later he became superintendent of the Carpenter Steel Co., Reading, Pa., and afterward served in a similar capacity at the Jersey City plant of the Crucible Steel Co. of America. He founded the Pawtucket company bearing his own name in 1910 and remained its active head until his death. He had been prominent in the civic and industrial life of his city and State, having served as president of the Pawtucket Chamber of Commerce and also having been a member of the New England Council, which has been active in promoting the business interests of the New England States.

ARTHUR E. DANFORTH, a director of Oglebay, Norton & Co., Cleveland, and for the past 15 years affiliated with the sales organization of that company, died July 18, aged 43 years. He had been connected with the company for 24 years. His sales work in the firm's iron ore business brought him in close contact with the iron and steel industry, in which he had a wide acquaintance. Mr. Danforth was born in 1884 and attended

the East Cleveland schools and Oberlin College.

JOHN MAXWELL, president Maxwell Steel Vault Co., Oneida, N. Y., died at his home in that city on July 19, following a stroke of apoplexy. He was 83 years of age, but had been active until his death in the company, which he had founded in 1904.

WILLIAM T. KENNEDY, until his retirement two years ago superintendent of the Watertown, N. Y., foundry of the New York Air Brake Co., died at his home in that city on July 16, aged 65 years.

CHARLES WALTZ, editor of the *Iron, Bronze and Wire News*, Cincinnati, died at Dolgeville, N. Y., on July 18, as the result of injuries sustained in an automobile accident at Caroga Lake, N. Y. He was commissioner of the Ornamental Iron and Bronze Manufacturers Association.

DR. JAMES EDGAR DENTON, professor emeritus of mechanical en-

gineering at the Stevens Institute of Technology, Hoboken, N. J., died on July 22 at Maplewood, N. J., aged 73 years. He was born at Piermont, N. Y., and after graduation from Stevens in 1875 he served for a time as an instructor. He became professor of experimental mechanics in 1886 and professor of mechanical engineering and shop practice in 1898. From 1882 until 1886 he was engaged in the manufacture of rock drilling machinery.

DAVID T. ADAMS, pioneer of the Minnesota iron mines, died in Chicago, July 22, aged 69 years. In the fall of 1883 he discovered the Mesabi Range, and he was one of the earliest mining men on the Cuyuna Range. The Adams mine, named for him, and the Fayal mine, which he also discovered, are now properties of the United States Steel Corporation. At the time of his death he still owned mining properties that were leased to operating companies. He was born at Rockford, Ill.

THOMAS G. SMALLWOOD, during the past 14 years district manager at Cincinnati for the Chicago Pneumatic Tool Co., died July 20 after a lingering illness. He was 65 years of age.

Canadian Automobile Output Smaller

WASHINGTON, July 23.—June production of automobiles in Canada, as reported to the Department of Commerce by the Dominion Bureau of Statistics, was as follows: Passenger cars, 25,341; trucks, 3058. This compares with 29,764 passenger cars and 4178 trucks in May and with 16,470 passenger cars and 2738 trucks in June, 1927.

Smaller Orders for Steel Furniture

WASHINGTON, July 24.—Orders for steel furniture in the business group in June were valued at \$2,763,900, compared with \$3,085,365 in May, according to reports received by the Department of Commerce from 33 manufacturers. Orders in the shelving group in June were valued at \$737,060, against \$732,921 in May.

Shipments of steel furniture in the business group last month were valued at \$3,009,054, compared with \$3,213,018 in May, while unfilled orders were valued at \$1,992,665 on June 30 and \$2,232,594 on May 31. Shipments of shelving furniture in June were valued at \$720,253, against \$768,562 in May, while unfilled orders at the end of June were valued at \$729,310, compared with \$752,512 at the end of May.

For the six months ended June 30 orders for steel furniture in the business group were valued at \$18,591,964, against \$16,181,697 for the cor-

responding period of last year. The gain was 15 per cent. Orders for shelving furniture in the first half-year were valued at \$4,561,795, against \$3,870,691 for the corresponding period of 1927. Here the increase was nearly 18 per cent.

Heavy Sheet Sales in June

Sales of sheet steel showed a sharp gain in June, being 318,902 tons or 68,586 tons over the previous month and larger than any previous month of the year except during March, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers, Cleveland. Production, which was 311,629 tons, fell off considerably, being the smallest of any month of the year, and shipments also declined, but to a less extent. Shipments were 308,741 tons or 3000 tons less than production. May shipments were 326,324 tons. Unfilled orders on July 1 amounted to 526,798 tons or about 1000 tons less than on May 1. The June report and comparisons follow:

	June	May	April
Total number of mills	721	721	721
Capacity per month	471,350	506,000	464,422
Percentage reporting	70.1	72.2	72.2
Sales	318,902	250,316	284,070
Production	311,629	349,367	327,909
Shipments	308,741	326,324	327,674
Unfilled orders	526,798	527,477	571,761
Unshipped orders	100,904	112,664	109,200
Unsold stocks	50,702	54,047	53,853
Percentages of Capacity			
Sales	96.5	68.5	84.7
Production	94.3	95.6	97.8
Shipments	93.4	89.3	97.7
Unfilled orders	159.4	170.4	170.4
Unshipped orders	30.5	30.8	32.6
Unsold stocks	15.3	14.8	16.0

Machinery Markets and News of the Works

July Sales Holding Up Well

Wright Aeronautical Corporation, General Electric Co. and Implement and Tractor Companies Are Large Buyers
—Miscellaneous Demand in Good Volume

MACHINE tool buying is holding at a high rate for July and the total for the month, it is now assured, will fall little, if any, short of that in June. The past week has been featured by large buying by the Wright Aeronautical Corporation and the General Electric Co.

It is estimated in the trade that the expenditures of the Wright Aeronautical Corporation for equipping a new unit of its plant at Paterson, N. J., will total \$500,000 or more. The General Electric Co. is buying heavily for its refrigerator departments at the Schenectady and Erie plants. Twenty large presses were among its purchases.

At Chicago, orders from the implement and tractor industry continue to make up a goodly proportion of current business. It is estimated that the J. I. Case Threshing Machine Co. and the John Deere Tractor Co. have each spent \$225,000 for machine tools since the first of the year, and other farm equipment manufacturers have also been steady buyers. The Ludlow Typograph Co., Chicago, has bought about \$15,000 worth of tools.

The present healthy demand for machine tools has greater significance from the fact that neither the railroads nor the automobile companies, which normally contribute a good share of such business, are important buyers. Automobile parts manufacturers are buying some machinery, but there is little demand from the Michigan automobile manufacturers. Railroad buying is almost negligible.

New York

NEW YORK, July 24.—Orders from the Wright Aeronautical Corporation, Paterson, N. J., which have been distributed among a number of sellers, have helped materially in raising July sales records to a point which will make the month compare fairly well with June. Moreover, July this year will run considerably ahead of the same month last year. Purchases of the Wright company, it is stated in the trade, will total \$500,000 or more. The General Electric Co. still has requirements to be covered for its refrigerating machinery department, but has not been buying so actively in the last week. Scattered orders for tools are in fairly good volume. A notable exception is in the railroad field, where the demand is exceedingly quiet.

Included in the week's sales of the Niles-Bement-Pond Co. were a 90-in. journal turning lathe, a 3500-lb. double-frame steam hammer and an 18-in. slotter. This company also sold on the Pacific Coast three Brown & Sharpe machines. The Pratt & Whitney division sold a duplex hobbing machine, a 13 x 30-in. and a 16 x 36-in. lathe, two No. 3 universal bench milling machines, three No.

1 9½-in. deep-hole drilling machines, a No. 1 13-ft. deep-hole driller, a 6-in. and a 12-in. vertical shaper, two No. 2 jig boring machines, a bench lathe and a Sigourney drilling machine.

Bids are being asked by Department of Mental Hygiene, Capitol Building, Albany, N. Y., Lewis M. Farrington, secretary, until Aug. 1 for two double-end steel Diesel electric ferryboats, and until Aug. 15 for complete machinery for the two ferryboats for Manhattan State Hospital, Wards Island, New York. Plans and specifications at office noted and at office of Department of Public Works, Division of Architecture, Flatiron Building, New York, and 353 Broadway, Albany.

Elevating machinery, conveying equipment, factory trucks and tractors, and other handling equipment will be installed in ten-story warehouse and distributing building to be erected by Lehigh Valley Railroad Co., 143 Liberty Street, New York, at Gerard Avenue and 144th Street, to cost approximately \$1,000,000. E. E. Loomis is chief engineer.

Brooklyn Parking Terminal, Inc., 250 Park Avenue, New York, has filed plans for a six-story automobile service, repair and garage building to cost \$300,000 with equipment. J. B. Peterkin, 285 Madison Avenue, New York, is architect.

Mitchell-Vance Co., 503 West Twenty-fourth Street, New York, manufacturer of lighting fixtures, has leased space in building at 70 Washington Street, Brooklyn, and will remove to that location.

Superintendent of Lighthouses, Staten Island, N. Y., will receive bids until Aug. 6 for 74 pieces cast steel stud link lightship chain, 130 cast steel shackles, and 75 cast steel swivels for lightship chain, proposal 27574; until Aug. 8 for wrought iron stud link lightship chain, open link wrought iron buoy chain in 15-fathom lengths, bridle chains for bell buoys, iron buoy swivels, split key steel buoy shackles, riveted pin steel buoy shackles, and cast steel mushroom anchors, proposal 27599.

Charles Goodman, 375 Fulton Street, Brooklyn, architect, has plans for one-story automobile service, repair and garage building to cost close to \$100,000 with equipment.

Board of Education, White Plains, N. Y., plans installation of manual training equipment in new three-story high school to cost \$1,000,000, for which bids are being asked on general contract. Starrett & Van Vleck, 393 Seventh Avenue, New York, are architects.

Trinity Iron Works, Inc., New York, has acquired four four-story buildings, 100 x 100 ft., at 311-17 East Twenty-first Street, and adjoining five-story building, 40 x 98 ft., at 316-18 East Twenty-second Street, for a local plant.

Officials of Staten Island Shipbuilding Co., Port Richmond, S. I., have organized Heat Transfer Products, Inc., to operate as a division of parent company. It is understood that new organization will occupy a section of shipyard for manufacture of special heating equipment. New York offices will be at 90 West Street. George T. Jacocks, formerly vice-president of Whitlock Coil Pipe Co., Hartford, Conn., will be president and general manager; W. S. Ogilvy is vice-president, in charge of production.

Mutual Metal Craft Co., 306 East Fortieth Street, New York, has leased space in building at 388-90 Second Avenue for expansion.

Union School District No. 28, Long Beach, N. Y., is considering installation of manual training equipment in a three-story high and grade school, to cost about \$300,000. H. L. Smith, 100 East Forty-second Street, New York, is architect.

Benjamin Driesler, Jr., 153 Remsen Street, Brooklyn, architect, has taken out a permit for a three-story automobile service, repair and garage building, 108 x 200 ft., to cost \$350,000 with equipment.

Plans are being arranged by Great Atlantic & Pacific Tea Co., 420 Lexington Avenue, New York, for a new coffee-roasting plant at Toledo, Ohio, with ovens, conveying machinery and other equipment, to cost close to \$200,000 with equipment.

The Crane Market

A fair seasonal amount of new business has been placed during the present month and pending, while not all that might be desired, is considered satisfactory. No action has been reported on the considerable amount of prospective export business, but developments on some of these inquiries are expected early in August. Stevens & Wood, Inc., New York, has changed the requirements on a power house crane which will be bought for Deepwater, N. J., and the Reading Iron Co., Reading, Pa., is expecting to purchase a used 7½, 10 or 15-ton electric overhead crane.

Among recent purchases are:

Wilcox & Stultz, Inc., Brooklyn, crawler crane, from Har-nischfeger Corporation.

F. G. Schaefer Iron Works, Edgewater, N. J., two 3-ton electric hoists, from Box Crane & Hoist Corporation.

George H. Flinn Corporation, New York, reported to have purchased caterpillar crane from Industrial Brownhoist Corporation.

Gulf Refining Co., New York, one 5-ton, one motor electric overhead crane, with 37-ft. 8-in. span, from Box Crane & Hoist Corporation.

Philadelphia

PHILADELPHIA, July 23.—Plant and business of Federal Container Co., Fifty-sixth Street and Paschall Avenue, Philadelphia, manufacturer of corrugated paper products, has been acquired by Fiber Board Products, Inc., San Francisco, operated jointly by Zellerbach Corporation and Paraffine Companies, Inc., same city. New owner will operate as subsidiary and use as Eastern branch plant.

West Philadelphia Stock Yards Co., Thirtieth Street, Philadelphia, plans installation of conveying machinery, overhead trolley system, refrigerating equipment and other apparatus in proposed abattoir to cost more than \$650,000. J. M. Harlan is president.

Atlantic Gas Co., Lewis Building, Philadelphia, is completing plans for new gas plant at Lexington, N. C., installation to include high pressure tanks, oil tanks, generating sets, purifiers, compression equipment, blowers and accessory equipment. Company also plans to install about 20 miles of steel pipe for distribution.

Philadelphia Rapid Transit Co., 810 Dauphin Street, Philadelphia, has acquired through its subsidiary, Transit Land Co., property at Second and Third Streets and Chelton Avenue, totaling 220 building lots, and will use portion of site for new repair and maintenance shops.

Philadelphia Fibre Box Board Mill, Inc., Delaware Avenue and Tasker Street, Philadelphia, has awarded general contract to L. Rosengarten, Otis Building, for three-story and basement addition, 50 x 120 ft., to cost about \$35,000.

Edmund H. Poggi, Philadelphia, architect, has plans for a new airport and seaplane port on Pettys Island, for a company now being organized by local interests, to include hangars, repair and reconditioning shops, oil storage and distributing building and other units, to cost in excess of \$100,000 with bulkheading of site, etc.

Sunbury Converting Works, Inc., Sunbury, Pa., is having plans drawn for a power house in connection with a new textile mill at Belvidere, N. J., entire project to cost in excess of \$90,000, for which bids will be asked on general contract early in August. Company will also build addition to power plant at its Sunbury mill. W. E. S. Dyer, Land Title Building, Philadelphia, is architect and engineer.

Roller Bearing Corporation of America, Inc., is completing removal of its plant from Newark, N. J., to former plant of Mercer Automobile Co., Whitehead Road, Trenton, N. J., where operations will be concentrated in future. It is purposed to increase production at new location.

T. Arthur Karno, Broad Street Bank Building, Trenton, N. J., a member of Karno-Smith Co., Inc., same address, building contractor, has acquired plant of Bordentown Steel & Tube Co., near Bordentown, N. J., at trustee's sale in bankruptcy. New owner plans to continue operations for manufacture of steel tubing and kindred products, and will remodel and improve works. It is understood that new company will be formed to operate mill.

New Jersey Cannery Corporation, care of Edwards & Green, 548 Federal Street, Camden, N. J., architects, plans installation of cold storage and refrigerating plant in new factory at Hammonton, N. J., 100 x 450 ft., to cost more than \$100,000.

Pennsylvania Power & Light Co., Allentown, Pa., an interest of Electric Bond & Share Co., 2 Rector Street, New York, has acquired property in vicinity of Frackville, Pa., and is reported planning new steam-operated electric power plant, to cost more than \$450,000, to be used largely for service in connection with proposed electrification of Mahanoy Plane division of Reading Railway.

City Council, Bethlehem, Pa., has leased a tract of 78 acres on Hellertown Road, held by Bethlehem Steel Realty Co., as site for new municipal airport, and will develop property at early date, with erection of hangars, repair and reconditioning shops and other structures.

Superior Anthracite Coal Co., Carbon-dale, Pa., is considering early rebuilding of coal breaker at its local colliery, destroyed by fire July 19, with loss close to \$80,000 with equipment.

Board of Trustees, Pennsylvania State College, State College, Pa., has asked bids on general contract for a new engineering building for mechanical and other engineering work, to cost more than \$100,000. Charles Z. Klauder, Franklin Bank Building, Philadelphia, Pa., is architect.

Pittsburgh

PITTSBURGH, July 23.—Machine tool business has shown some improvement the past two weeks in sales and inquiries. The Westinghouse Electric & Mfg. Co. has made a few purchases against its third quarter list and is expected to close for several of the important items before the end of the month. Single item orders are fairly numerous. The trade gets its chief encouragement, however, from increased inquiries.

A company is being organized by C. P. Mayer, head of Mayer Aircraft Corporation, Bridgeville, Pa., to establish and operate a local plant for manufacture of cabin-type monoplanes, including parts

F. L. Smidth & Co., 50 Church Street, New York, engineers, and manufacturers of cement mill machinery, will soon begin work on a one-story foundry addition at Elizabeth, N. J., to cost about \$25,000. A crane runway will be installed. John S. Branne, Grand Central Terminal, New York, is consulting engineer.

Borough Council, Fairlawn, N. J., is asking bids until Aug. 14 for equipment for municipal waterworks, including pumping machinery, electrical equipment, elevated tank and tower. McClave & McClave, Cliffside, N. J., are borough engineers. Jasper Van Hook, Jr., is borough clerk.

Humphreys Shipyard Corporation, 347 Madison Avenue, New York, Frederic P. Humphreys, president, has plans for extensions and improvements in its recently acquired plant at Keyport, N. J., to cost close to \$50,000 with equipment. Plant will be devoted to production of Diesel engine-driven yachts.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., has secured a franchise from Township Committee, Montville, N. J., providing for construction of local gas-generating and storage plant.

American Metal Moulding Co., 146 Coit Street, Irvington, N. J., has awarded general contract to Eustice Brothers, Inc., 111 Academy Street, Newark, for a new plant unit, 52 x 200 ft., largely for pipe manufacture, to cost in excess of \$50,000.

Pioneer Iron Works, Inc., Newark, Louis J. Siegler, president, has leased about one-half acre at rear of 317-21 Freylinghuysen Avenue, as site for new plant for structural steel and ornamental iron working, for which plans will be drawn soon, to cost close to \$45,000 with equipment.

General Tube Co., 49 Empire Street, Newark, manufacturer of metal tubing, etc., is having plans drawn for a one-story addition, to cost about \$25,000. Simon Cohen, 130 Branford Place, is architect.

Commissioner of Correction, Department of Correction, 11 North Pearl Street, Albany, N. Y., will receive bids until Aug. 16 for mechanical stokers, feed water heater, etc., for Sing Sing Prison, Ossining, N. Y. Plans and specifications at office of Department of Public Works, Division of Architecture, 353 Broadway, Albany.

M. E. Bernhardt Co., Inc., 127 West Thirtieth Street, New York, has purchased high temperature electric furnace for special operation from Steinmetz Heating Co., Inc., 30 Church Street, New York.

Yale Electric Corporation, Brooklyn, has moved into its new building at 257 Cornelison Avenue, Jersey City.

and assembling works. Company will also develop a local landing field, with hangars, repair shop, etc.

Board of Education, Apollo, Pa., is said to be planning installation of manual training department in new two-story high school to cost close to \$200,000, for which plans are being drawn by A. L. Thayer, Greer Building, New Castle, Pa.

Yelloway Bus Co., Pittsburgh, operating a motor bus system, has leased building of Manchester Auto & Machine Co., 816-26 Manchester Boulevard, for establishment of new service, repair and garage building.

Hammermill Paper Co., Erie, Pa., has plans under way for new mill at Hoquiam, Wash., adjoining plant of Gray's Harbor Pulp Co., now in course of construction at that place. New unit is reported to cost in excess of \$400,000.

City Council, Follansbee, W. Va., is asking bids until July 31 for a 25-ton incinerator plant.

Board of Trustees, Carnegie Institute of Technology, Pittsburgh, is arranging for establishment of new course in aeronautical engineering beginning with fall term, and will install equipment for instruction, testing, and construction of airplanes, engines, parts and aircraft instruments. Prof. A. H. Blaisdell will be in charge.

Chicago

CHICAGO, July 23.—Sales of machine tools are holding up much better than was expected. Bookings of local machinery houses this month will not be as large as in June, but that month for some sellers was the best in orders entered since 1920. The J. I. Case Threshing Machine Co., Racine, Wis., has placed orders for several special boring and drilling machines, and the John Deere Tractor Co., Waterloo, Iowa, has purchased a number of grinders, special drilling machines and other tools. In recent months there has been a steady stream of machine tool orders from the farm equipment industry, particularly from builders of tractors. It is estimated that the J. I. Case Threshing Machine Co. and the John Deere Tractor Co. have each spent close to \$225,000 for machine tools in the past six months.

Demand from miscellaneous sources is still in good volume. Ludlow Typograph Co., Chicago, has bought about \$15,000 worth of tools, including two milling machines, a surface grinder, a turret lathe and a drill press. There is little railroad buying, but the Burlington is expected to take early action on a small standing list. Chicago & North Western is inquiring for a motor-driven axle lathe with 25-hp. motor, 440 volts, 60 cycle, 3 phase; also for a motor-driven metal pattern grinding and filing machine with set of tools, No. M. P. 5 Strand or equal, 110 volts, 60 cycle, single phase. There continues to be a fair call for second-hand tools.

Chicago Board of Education will close bids July 26 on a motor-driven No. 3, or equivalent, Ryerson serpentine shear, a 36-in. band saw, a Yates American, or equivalent, 48 x 6-in. grinder and a 12-in. hand jointer with a 7 ft. table.

Contract has been let by Austin Millwork Co., 933 North Cicero Avenue, Chicago, to John Duff, Oak Park, Ill., for one story and basement addition, 125 x 125 ft., to cost close to \$50,000 with equipment.

George E. Pearson, 4000 West North Avenue, is architect.

Reynold S. Brandt, 6971 Greenview Avenue, Chicago, manufacturer of metal goods, has acquired one-story building, 50 x 100 ft., for expansion.

General Electric Co., Schenectady, and 230 South Clark Street, Chicago, is asking bids until July 31 for new factory branch and distributing plant at Pershing Road and Ashland Avenue, Chicago, to cost in excess of \$100,000. Graham, Anderson, Probst & White, 80 East Jackson Boulevard, are architects.

Common Council, Atlantic, Iowa, is asking bids until Aug. 1 for one boiler, stoker and auxiliary equipment for municipal power plant. T. E. Nichols is city clerk.

Northwestern Cabinet Co., Burlington, Iowa, is considering rebuilding portion of plant destroyed by fire July 15, with loss estimated at \$150,000, including equipment and stock.

Waterworks Department, Waterloo, Iowa, George Shoemaker, general manager, is having plans drawn for one-story and basement equipment storage and distributing plant, with repair facilities, including garage for motor trucks and cars, 75 x 120 ft. John S. Bartley, Pioneer National Bank Building, is architect.

Des Moines Casket Co., 405 Southwest Eighth Street, Des Moines, Iowa, has awarded general contract to Garmer & Stiles, 519 Fourteenth Street, for new one-story plant, 100 x 135 ft., to cost about \$40,000 with equipment.

Board of Education, Mattoon, Ill., is considering installation of manual training equipment in new three-story high school to cost \$275,000. Berger & Kelley, Lincoln Building, Champaign, Ill., are architects.

Conveying equipment, motors and other mechanical apparatus will be installed in new one-story printing plant, 310 x 500 ft., to be built by Robert O. Law Co., 633 Plymouth Place, Chicago, to cost \$400,000. Frank Chase, Inc., 720 North Michigan Boulevard, is engineer.

Chevrolet Motor Co., 3044 West Grand Boulevard, Detroit, is said to be planning new two-story branch assembling plant, 115 x 250 ft., at Fargo, N. D., to cost in excess of \$125,000 with equipment.

Montana-Dakota Power Co., Marmarth, N. D., is planning one-story addition to local steam-operated electric power plant, including installation of additional equipment, to cost in excess of \$45,000.

Northern Pacific Railroad Co., St. Paul, Minn., will erect an addition to its power plant to cost \$50,000.

Butler Brothers Mining Co., Nashwauk, Minn., is constructing a machine shop and warehouse, 44 x 100 ft.

New England

BOSTON, July 23.—The city of Boston is reported to have purchased some grinding tools for its Hyde Park district school, and one machine tool house has sold some heavy and expensive tools, details of which are withheld. The new tool market otherwise was dull the past week and comparatively little used equipment was sold. New inquiries have also fallen off.

Unless the city of Boston buys additional equipment for its Hyde Park school within the next few days, July will be a lean month for a majority of machinery houses. Two or three companies, however, will have had the best month this year.

The failure of users, particularly in Massachusetts, Connecticut and Rhode Island, to purchase new tools is all the more noteworthy in view that a high level of activity is maintained in metal-working plants, and a real shortage of highly skilled men is reported.

Permission has been granted George B. Torngren, 712 Broadway, Everett, Mass., tinsmith, to erect a new plant. Plans are private.

Edison Electric Illuminating Co., 39 Boylston Street, Boston, has awarded contract for a plant at Canton, Mass. French & Hubbard, 210 South Street, Boston, are engineers.

Henry & Richmond, 112 West Street, Boston, architects, have completed plans for a one-story 60 x 45 ft. power plant, at Massachusetts Normal School, Bridgewater, Mass. J. B. Worcester Co., 72 Milk Street, Boston, is structural engineer.

D. T. Cormier, 15 Herbert Street, Somerville, Mass., architect, is preparing plans for a one-story shop, 40 x 60 ft., to be built by A. Belanger & Son, Dudley Street, Cambridge, Mass., on Brookford Street, that city.

Fred T. Lay Co., Inc., 1215 Main Street, Springfield, Mass., was the bidder on a new pumping station to cost, with equipment, \$170,000 in Brightwood district, to be built by city of Springfield. McClintock & Craig, 456 Bridge Street, Springfield, are the architects.

Alden Mfg. Co., Campello, Mass., radio accessories, has merged with Johnson Tool & Molding Co., East Weymouth, Mass. Machinery and business of East Weymouth company will be moved to Campello.

Packard Motor Car Co., East Grand Boulevard, Detroit, has asked bids on general contract for four-story service, repair and sales building on Commonwealth Avenue, Boston, 116 x 230 ft., to cost more than \$160,000 with equipment. Albert Kahn, Marquette Building, Detroit, is architect.

Froiland Chain & Mfg. Co., Albany Street, Springfield, Mass., Paul Froiland, head, has filed plans for one-story plant unit, to cost about \$25,000 with equipment.

Burns Brothers, Inc., 260 Huyshope Avenue, Hartford, Conn., has taken out a permit for new one-story central repair and machine shop at its new coal and coke distributing plant in Parkville district, to cost approximately \$25,000 with tools.

New England Transportation Co., Fall River, Mass., is considering plans for new motor bus terminal with garage, service and repair facilities, to cost close to \$200,000 with equipment.

Metal Craftsmen, Inc., 141 Georgia Avenue, Manucentre district, Providence, R. I., manufacturer of window ventilators, etc., has work under way on one-story, L-shaped addition, 50 x 125 ft., to cost more than \$40,000.

American Writing Paper Co., Main Street, Holyoke, Mass., has awarded general contract to Casper Ranger Construction Co., 20 Bond Street, for three-story addition, and one-story boiler plant, to cost about \$60,000 with equipment.

Charles Street Garage Co., Boston, has awarded general contract to Aberthaw Co., 80 Federal Street, for two-story service, repair, and garage building, 85 x 130 ft., to cost approximately \$100,000 with equipment.

Saco-Lowell Shops, Lowell, Mass., manufacturer of textile machinery and parts, is arranging for early removal of final

operating unit of local plant to Newton Upper Falls, Mass., where production will be concentrated. Lowell shop will be placed on market.

Blanchard Mfg. & Canning Co., Eastport, Me., is said to have plans for new factory unit to cost about \$50,000. It will replace a portion of plant recently destroyed by fire.

Cavanagh Engineering Co., 131 Washington Street, Providence, R. I., has been formed to manufacture automobile accessories and devices. Company has placed Solite trouble lamp on market and is having parts made to specifications and doing its own assembly work. Metal stampings, fiber parts, screw machine products, miniature automobile lamps and wire are being purchased.

Contract for construction of power plant for Underwood, Elliott-Fisher Co., Hartford, Conn., has been let to Aberthaw Co., Boston.

Cleveland

CLEVELAND, July 24.—Machine tool sales were fairly good the past week and the July volume promises to show a gain over June. The majority of orders during the week were for single machines. The General Electric Co. is buying considerable press equipment for its Erie, Pa., works, for making electric refrigerators. It has purchased about 20 large presses and has another inquiry out for five large machines. This company is also buying complete die equipment for its presses. It is stated that its purchase of press equipment and machines now pending will aggregate \$225,000.

Byers Machine Co., Ravenna, Ohio, during the week purchased a 48-in. open-side planer and is inquiring for a horizontal boring machine. A Warren, Ohio, manufacturer also bought a planer of same type. Single tool orders for turret lathes continue good. Board of Education, Toledo, Ohio, is inquiring for eight or 10 metal-working machines, including lathes, grinders and one milling machine. Press manufacturers report a better volume of sales in this territory this month than in June and a 25 per cent gain over July last year. Automobile parts manufacturers are buying some machinery, but little business is coming at present from automobile manufacturers in the Michigan territory.

Plans are being arranged by Cleveland Electric Illuminating Co., Illuminating Building, Cleveland, for two-story power substation, to cost approximately \$100,000 with equipment.

Snappy Radiator & Battery Service Co., 736 Cleveland Avenue, S. W., Canton, Ohio, has asked bids on general contract for one-story addition, to cost about \$42,000 with equipment.

Diller Mfg. Co., Bluffton, Ohio, manufacturer of electrical products and radio equipment, has plans for new one-story plant, 85 x 118 ft., to cost about \$45,000 with equipment.

City Council, Canton, Ohio, has approved fund of \$100,000 for purchase of property for a municipal airport and erection of hangars, repair and reconditioning shops, oil storage and distributing building, and other mechanical units.

G. & C. Foundry Co., West Monroe Street, Sandusky, Ohio, manufacturer of rough gray iron castings, has plans for a one-story addition, 30 x 280 ft., and will soon begin superstructure.

Board of Education, Akron, Ohio, plans

installation of manual training equipment in new two-story and basement high school to cost about \$250,000, for which superstructure will soon begin.

Hocking Valley Railroad Co., Marion, Ohio, plans extensions in local water system to cost about \$250,000, including installation of pumping machinery and auxiliary power equipment, and water-softening equipment.

Superior Screw & Bolt Co., 3650 East Ninety-third Street, Cleveland, has filed plans for one-story machine shop, 100 x 150 ft., to cost close to \$70,000 with equipment.

Cleveland Railway Harbor Co., Williamson Building, Cleveland, will install elevating, conveying and other handling equipment, factory trucks and tractors, etc., in proposed eight-story warehouse and terminal building, to cost in excess of \$10,000,000. Moores & Dunford, Inc., 110 West Forty-second Street, New York, is engineer.

Buffalo

BUFFALO, July 23.—Arrangements have been made by Arcadia Truck Body Corporation, Newark, N. Y., for purchase of plant and business of H. H. Babcock Equipment Corporation, Watertown, N. Y., manufacturer of automobile bodies, and will consolidate with its organization. It is understood that new owner will discontinue operations at Watertown, and will remove equipment and concentrate production at Newark.

George W. Holt, 1374 Delaware Avenue, Buffalo, and associates have organized European Art Metal Corporation, with capital of \$25,000, and plans early operation of plant for manufacture of ornamental metal products. E. W. Holt, 70 Barkley Place, is also interested in new company.

Union Carbide & Carbon Corporation, 30 East Forty-second Street, New York, has purchased controlling interest in Acheson Graphite Corporation, with plant at Niagara Falls, N. Y., for manufacture of graphite in powdered and electrode form. New owner will operate Acheson plant as a division.

Board of Education, Syracuse, N. Y., is said to be planning installation of manual training equipment at central high school, in connection with new three-story addition and improvements in present building to cost about \$400,000. Bids will be asked in about 30 days. A. L. Brockway, Third National Bank Building, is architect.

General Gas Furnace Co., Inc., Rochester, N. Y., care of Frederick W. Armbruster, Sr., 4476 St. Paul Boulevard, recently formed by Mr. Armbruster and associates, plans operation of local plant for manufacture of gas-fired furnaces, parts, and other heating equipment. Lewis S. Edgerton, 84 Briarcliffe Road, Irondequoit, N. Y., is also interested in new company.

Oswego Falls Corporation, Fulton, N. Y., operating pulp and paper mills, has awarded general contract to Austin Co., for a two-story addition to cost close to \$100,000 with equipment.

Indiana

INDIANAPOLIS, July 23.—Plans have been approved by Southern Indiana Gas & Electric Co., Evansville, for new steam-operated electric power plant to cost in excess of \$1,250,000 with equipment. Extensions will also be made in transmission lines.

Board of Education, Columbus, is said to be planning installation of manual training equipment in two-story addition to junior high school to cost about \$100,000, for which bids will soon be asked on general contract. Norman H. Hill, Jr., 1050 North Delaware Avenue, Indianapolis, is architect.

Leueham & Dunphy, Vincennes, architects, have asked bids on general contract for automobile service, repair and garage building, to cost close to \$100,000 with equipment.

Ovens, power equipment, conveying and other machinery will be installed in four-story and basement warehouse to be built by Kroger Grocery & Baking Co., 815 Main Street, Cincinnati, at Indianapolis, to cost in excess of \$750,000. Emil H. Nieman, 3816 Shaw Avenue, St. Louis, is architect. A refrigerating and cold storage plant will be installed in separate unit; and automobile repair shop and garage built on adjoining site.

City Council, Muncie, is planning establishment of municipal airport and is arranging appropriation of \$75,000, to include hangars, repair and reconditioning shops, oil storage and distributing building.

Board of Public Works, Evansville, has plans under way for establishment of municipal airport, for which fund of about \$100,000 has been arranged, including hangars, repair shops, oil storage and distributing building and other units. B. Russell Shaw, Inc., 810 Olive Street, St. Louis, is architect.

Board of School Commissioners, 150 North Meridian Street, Indianapolis, has awarded general contract to W. P. Jungclauss, 825 Massachusetts Avenue, for Arsenal technical high school, with manual training department, to cost about \$200,000.

Bedford Foundry & Machine Co., Bedford, has completed a plant addition, 135 x 300 ft.

Property of Brazil Machine & Foundry Co., Brazil, will be offered at public auction soon at a receiver's sale.

Chamber of Commerce, Plymouth, Ind., is promoting the sale of \$30,000 worth of stock in Plymouth Body Works to finance an increase in its capacity. The company builds school hacks.

St. Louis

ST. LOUIS, July 23.—Bids have been asked on general contract by Central Hardware Co., 811 North Sixth Street, St. Louis, for two-story and basement storage and distributing plant, 90 x 195 ft., to cost about \$100,000 with equipment. Leo F. Abrams, Chemical Building, is architect.

Conveying machinery, refrigerating, and other equipment will be installed in new one-story meat-packing plant to be erected by Fred Dold Packing Co., 426 North Belmont Street, Wichita, Kan., to cost \$145,000 for which bids will be asked on general contract early in August. Henschien & McLaren, 1637 Prairie Avenue, Chicago, are architects and engineers.

Corn Products Refining Co., Kansas City, Mo., has filed plans for one-story addition at North Kansas City, to cost close to \$140,000. Headquarters are at 17 Battery Place, New York.

Board of Managers, Missouri School for Deaf, Fulton, Mo., has taken bids on revised plans for two-story manual training building, 51 x 101 ft., to cost more than \$45,000 with equipment. C. A. Smith,

Finance Building, Kansas City, Mo., is architect.

Kansas City Power & Light Co., Fourteenth Street and Grand Avenue, Kansas City, Mo., will take bids about middle of August for four-story automobile service, repair and garage building, 125 x 140 ft., with foundations for six additional stories later, to cost close to \$200,000. H. G. Freshman is company architect.

Red Bird Aircraft Corporation, 1513 North Fonshill Street, Oklahoma City, Okla., E. S. Keller, president, has taken over building formerly used for motor truck manufacture, and will remodel for new airplane works, with parts and assembling departments. Present factory at Bern, Kan., will be removed to new location.

Board of Public Service, City Hall, St. Louis, is said to be arranging fund of \$2,000,000 for establishment of municipal airport, and purposes to take over Lambert-St. Louis flying field at Bridgeton, Mo., and build hangars, repair shops and other units. B. Russell Shaw Co., 4616 Lindell Boulevard, is consulting engineer for project.

International Harvester Co., 606 South Michigan Avenue, Chicago, and 316 North Santa Fe Street, Salina, Kan., has awarded general contract to Fred Hartley, 121 North Second Street, Salina, for three-story factory branch and distributing plant, 50 x 120 ft., at Salina, to cost upward of \$85,000 with equipment.

City Council, Kansas City, Mo., has called special election on Aug. 7 to approve bonds for \$1,000,000 for a municipal airport, including land purchase and erection of hangars, repair and reconditioning units, and other buildings; also bonds for \$3,000,000 for extensions and improvements in municipal waterworks, including installation of pumping machinery and other power equipment.

Missouri-Kansas Zinc Co., 74 Trinity Place, New York, is planning extensions and improvements in plant of Kansas Zinc Mills Corporation in Missouri, including addition to flotation mill, conveying and transportation facilities, etc., to cost more than \$100,000.

Board of Education, Kearney, Neb., plans extensions and betterments in one-story manual training building to cost about \$35,000. H. M. McClure, Kearney, is architect.

Quick Motors Corporation, Union National Bank Building, Wichita, Kan., has plans for one-story plant, 50 x 150 ft., to cost about \$35,000 with equipment.

Reed & Duecker, Inc., 171 North Main Street, Memphis, Tenn., has been appointed representative in that territory for National Flue Cleaner Co., Groveville, N. J.

Detroit

DETROIT, July 23.—Contract has been let by Keeler Brass Co., Grand Rapids, Mich., to Owen-Ames-Kimball Co., Grand Rapids, for one-story addition, to cost close to \$40,000 with equipment.

Washtenaw County Board of Education, Ypsilanti, Mich., is planning construction of one-story mechanical arts and manual training building at school at South Ypsilanti, to cost in excess of \$100,000 with equipment.

Bohn Aluminum & Brass Corporation, 2512 East Grand Boulevard, Detroit, is arranging for bond issue of \$2,155,700, proceeds to be used primarily for purchase of plant and business of Michigan Smelting & Refining Co., 7885 Joseph Campeau Avenue, and for expansion.

City Council, Pontiac, Mich., has authorized fund of \$180,000 for construction of municipal airport, including hangars, repair and reconditioning shops, oil storage and distributing building and other units.

Federal Screw Works, Inc., 3401 Martin Avenue, Detroit, has awarded general contract to Hazelton & Clark, Michigan Theater Building, for one-story addition, 95 x 120 ft., to cost close to \$60,000 with equipment.

Consumers Power Co., Jackson, Mich., is arranging for increase in capital from \$75,000,000 to \$100,000,000, a portion of proceeds to be used for extensions and improvements in plants and system, including new hydroelectric generating plant units, transmission lines and power substations.

Evans Auto Loading Co., Dime Bank Building, Detroit, is arranging for increase in capital from \$700,000 to \$1,000,000, a portion of proceeds to be used for expansion, including new Pacific Coast branch at Eureka, Cal., for production of battery separators and kindred products. Company also specializes in manufacture of automobile loading equipment and devices.

Milwaukee

MILWAUKEE, July 23.—Continued improvement is noticeable, both in current machine tool business and prospects for the remainder of the year, especially with respect to local industries. It has been a long time since new projects in the foundry and machine shop group have been so numerous or of such proportions as those that have developed in the last two to three weeks. Inquiry for tools of all kinds is active and some shops are working overtime to make prompt deliveries.

One of the largest industrial construction undertakings in Milwaukee in more than a year is the erection of a \$500,000 addition, 280 x 720 ft., to works of A. O. Smith Corporation for fabrication of electrically welded pipe for lines in Southwestern oil fields. E. W. Burgess is construction engineer.

Kearney & Trecker Corporation, 5924 National Avenue, Milwaukee, manufacturer of milling machines, will again enlarge its capacity and has placed general contract with Joseph Sausen, 352 Greenfield Avenue, Wauwatosa, for a two-story addition, 72 x 75 ft. Plans are by Kirchhoff & Rose, architects, 196 West Water Street.

Austin Co., Cleveland, has general contract for a one-story manufacturing and storage building, 190 x 405 ft., for Geuder, Paeschke & Frey Co., 38 Fifteenth Street, Milwaukee, manufacturer of metal stampings, enameled ware, etc. Cost is estimated at \$100,000.

Chain Belt Co., 736 Park Street, Milwaukee, has placed general contract with Klug & Smith Co., consulting engineer, 69 East Wisconsin Avenue, for a manufacturing building, 104 x 150 ft., at its Orchard Street works, to be ready Sept. 15.

Waukesha Motor Co., Waukesha, Wis., which recently decided upon a \$600,000 works extension program, has engaged Wisconsin Bridge & Iron Co., Milwaukee, to design and erect first unit, 176 x 308 ft., to cost \$100,000. Equipment purchases are now being made. Harry L. Horning is president and chief engineer.

Van Brunt Mfg. Co., Horicon, Wis., division of Deere & Co., Moline, Ill., and manufacturing grain drills and seeding

machines, is preparing for plant extensions costing about \$200,000. Contracts will be placed through general offices at Moline for a forge shop, 145 x 180 ft.; three-story warehouse, 96 x 125 ft., and three-story addition for elevator shaft, 20 x 40 ft. Plans are by O. A. Eckerman, company engineer, Moline.

MacWhyte Co., 2906 Fourteenth Avenue, Kenosha, Wis., manufacturer of wire rope, cable, etc., is erecting an addition to its plant. George S. Whyte is president and general manager.

Spring City Foundry Co., 901 West St. Paul Avenue, Waukesha, Wis., manufacturer of gray iron castings, has work under way on a shop addition costing about \$25,000.

Kohn Mfg. Co., 1375 Thirtieth Street, Milwaukee, manufacturer of domestic garbage incinerators, is awarding contracts for a one-story addition, 59 x 105 ft.

Richland Center, Wis., is asking bids until Aug. 7 for one high-pressure steam turbine generator unit with auxiliaries, including one cooling tower, for city water and light plant. Guy C. Luckey is city clerk.

Gugler Lithographic Co., 687 Milwaukee Street, Milwaukee, is asking bids for erection of six additional stories on its two-story manufacturing building, 60 x 128 ft.

Cincinnati

CINCINNATI, July 23.—While the machine tool market is devoid of feature, current business placed with local builders has fallen only a little short of that in June. Almost without exception, orders have been for one or two tools and have come from all parts of the country. Fresh inquiries have been fairly good and indicate that any serious diminution in buying is not likely in the near future. Manufacturers naturally anticipate a temporary lull in sales during the next 30 to 60 days on account of the vacation season, but the decline in business is expected to be less than usual.

The New York Central is reported to have bought three or four engine lathes, and several carriers in the Chicago district are considering the purchase of single machines. The Jackson Steel Products Corporation, Jackson, Mich., has closed for a 5-ft. Right Line radial drill.

General contract has been let by Steel Products Engineering Co., Springfield, Ohio, to Knowlton-Wortman Co., local, for one-story addition, 90 x 195 ft., to cost close to \$70,000 with equipment. Lloyd Zeller, Springfield, is architect.

Bids will be asked about middle of August by Franciscan Fathers of Cincinnati, care of J. F. Shebley, Twelfth and Republic Streets, Cincinnati, architect for three-story Roger Bacon High School for Boys, with manual training facilities, to cost about \$750,000.

Air Corps, Material Division, Wright Field, Dayton, Ohio, will receive bids until Aug. 2 for 599 propellers, circular 43; until July 30 for 588 wheel assemblies, 800 hub bushings and 1624 streamlines, circular 42.

Carnation Milk Products Co., Oconomowoc, Wis., is said to be planning construction of can-manufacturing unit in connection with proposed milk condensary at Maysville, Ky. A power house and machine shop are planned also. Entire project is reported to cost close to \$500,000.

United States Engineer Office, Louis-

ville, will receive bids until Aug. 9 for machinery for power house at lock and dam No. 51, Ohio River, including pumping equipment and gate and valve-operating machinery.

Sevierville Power & Light Co., Sevier-ville, Tenn., has plans for addition to electric light and power house, including installation of additional equipment. L. M. Dow is engineer.

Board of Education, Hamilton, Ohio, plans installation of manual training equipment in new two-story junior high school to cost \$500,000, for which bids will soon be asked on general contract. F. J. Mueller, Rentschler Building, is architect.

Eastbourne Garage Co., Cincinnati, has awarded general contract to Ferro Concrete Construction Co., Cincinnati, for four-story service, repair and garage building to cost in excess of \$500,000. Harry Hake, Telephone Building, is architect.

Safety Automatic Gate Co., box 382, Ashland, Ky., has been incorporated to manufacture patented safety automatic gate for railroad crossings. Company expects to locate plants at Ashland and Chicago.

South Atlantic

BALTIMORE, July 23.—Plans are being arranged by Burns Bottling Machine Works, Inc., 2329 Kirk Avenue, Baltimore, for extensions and installation of new equipment; an electric trolley hoist about 2000-lb. capacity, with accessory apparatus will be purchased.

Davison Chemical Co., Garrett Building, Baltimore, manufacturer of fertilizer products, etc., has plans for addition to plant in Curtis Bay section, to cost more than \$375,000 with machinery. A. Benson is company engineer.

William H. Swartz, 205 West Camden Street, Baltimore, vice-president, Columbia Wholesale Aircraft Corporation, is at head of new company being organized to establish a plant for production of small commercial airplanes to sell at popular price. Factory property will be secured at once and equipment installed. Allen Davis, Baltimore, will also be connected with new company, as well as Harvey W. Doyle, formerly with Detroit Aircraft Corporation, Detroit.

Board of Aldermen, Rocky Mount, N. C., will receive bids until July 31 for equipment for municipal power plant, including one 5000-kw. turbo-generator, with direct-connected exciter; one turbo-generator air cooler; one surface condenser for turbo-generator, complete with motor-driven condensing water circulating pump; dry vacuum pumps; motor-driven hot well pump; steam turbine-driven hot well pump; automatic atmospheric exhaust relief valve and accessory equipment. William C. Olsen, Inc., Raleigh, N. C., is engineer.

United States Leather Co., 17 Battery Place, New York, is reported planning one-story paper mill unit, 100 x 400 ft., in conjunction with tannery at Big Stone Gap, Va., for production of coarse paper pulp materials as used in leather industry. It is estimated to cost more than \$350,000 with machinery.

In connection with expansion and improvement program to cost \$21,144,724, authorized by Chesapeake & Ohio Railroad Co., Richmond, Va., it is planned to make additions in present locomotive and car repair shops, and to build new units of this kind to cost more than \$1,000,000 of sum noted.

Roanoke River Power Co., Richmond, Va., is planning early construction of hydroelectric power plant on Roanoke River, near Bugg's Island, vicinity of Weldon, N. C., with initial capacity of 80,000 hp., estimated to cost more than \$5,000,000 with power dam and steel tower transmission system.

General purchasing officer, Panama Canal, Washington, is asking bids until Aug. 13 for drilling machines, concrete mixers, wire cloth, wire lath, cable, insulated wire, soldering irons, copper rail conductor, and other mechanical equipment, Panama circular No. 1891.

Albany Crystal Ice Co., Albany, Ga., has approved construction of new ice-manufacturing plant to cost about \$50,000.

Hiner Supply Co., Raleigh, N. C., is rebuilding machine shop and foundry recently destroyed by fire, to cost close to \$40,000 with equipment.

Eastern Silica & Chemical Corporation, care of John F. Penrose, Winchester, Va., president, recently formed by Mr. Penrose and associates, plans development of glass sand deposits in western part of Winchester County, where tract of more than 150 acres has been acquired, including installation of mining machinery, mill, power equipment, etc., to cost more than \$45,000.

Bureau of Yards and Docks, Navy Department, Washington, is asking bids (no closing date stated) for power plant equipment for naval station at Quantico, Va., including watertube boiler, coal pulverizers, burners, turbine and motor-driven forced-draft fans, feed water heater, storage tanks; boiler feed, vacuum and condensate pumps, electric pyrometer; equipment for conveying and storing coal and ashes; refrigerating and ice-making machinery; switchboard and accessory equipment, specification 5602.

American Peanut Corporation, Norfolk, Va., plans installation of two 100-hp. oil engine units, with auxiliary equipment, for power service at mill, and will soon make purchase.

Virginia-Carolina Power Co., Mutual Building, Richmond, Va., is said to be planning new hydroelectric generating plant on Roanoke River, with initial capacity of 50,000 hp., to cost more than \$3,500,000 with transmission system.

A. S. Furtwangler, 4 South Broad Street, Charleston, S. C., has been appointed representative for National Flue Cleaner Co., Inc., Groveville, N. J.

Gulf States

BIRMINGHAM, July 23.—Plans are being considered by Fort Worth & Denver City Railway, Fort Worth, Tex., for a new coach shop at Childress, Tex., for car repair and construction work, to cost about \$150,000.

J. S. Cosden & Co., Tulsa, Okla., have approved plans for a new oil refinery at Big Springs, Tex., with capacity of 10,000 bbl. per day in skimming and cracking units, to cost more than \$850,000 with machinery. Company will also build 12-mile pipe line from oil wells to refinery.

Parkersburg Rig & Steel Co., Parkersburg, W. Va., manufacturer of oil well equipment, plans new branch plant in Esperson industrial tract, Houston, Tex., to cost close to \$23,000.

Crane Co., 836 South Michigan Avenue, Chicago, has filed plans for one-story and basement factory branch and distributing plant at Dallas, Tex., to cost \$70,000 with equipment.

Abilene Cottonseed Oil Co., Abilene,

Tex., has plans for a new one-story cottonseed oil mill, 90 x 350 ft., to cost about \$75,000 with equipment, and will soon begin superstructure.

Anticich Packing Co., Biloxi, Miss., has approved plans for one-story ice-manufacturing plant, 45 x 100 ft., to cost \$70,000.

Yount-Lee Co., Beaumont, Tex., has awarded general contract to Reeves Brothers, Birmingham, for addition to oil storage and distributing plant at Spindleton, to cost more than \$500,000 with equipment.

Following recent acquisition of mill of L. H. Gilmer Co., Inc., Shreveport, La., manufacturer of belting, etc., by new interests, headed by Chester Tharp, George Beveridge, and associates, plans are being arranged for extensions and improvements, including installation of new machinery.

Beebe Ice Co., South Grandview Avenue, Daytona Beach, Fla., is planning construction of new ice-manufacturing plant at Pensacola, Fla., to cost about \$75,000.

E. A. George, 1146 Kings Highway, Shreveport, La., architect, has filed plans for a three-story automobile service, repair and garage building, to cost about \$130,000.

Rome Electric Range Co., Huntsville, Ala., will proceed with erection of new one-story plant, 50 x 165 ft., and will soon purchase equipment, including battery of small presses and other tools.

C. M. Ayres, Tuscaloosa, Ala., architect, will soon begin work on two-story and basement automobile service, repair and garage building, 110 x 132 ft., to cost close to \$85,000 with equipment.

A. & K. Auto Top & Paint Co., Dallas, Tex., manufacturer of automobile tops, frames, etc., plans rebuilding portion of plant recently destroyed by fire, with loss reported at \$50,000 including equipment.

Board of Education, Montgomery, Ala., will build one-story vocational shop at new Lanier High School, for which appropriation of \$1,000,000 has been made. Bids on general contract are being asked until July 31. Frederick Ausfeld, Shepherd Building, is architect.

Fuel Efficiency Engineering Co., American Trust Building, Birmingham; Buckmaster-Luck-Malochée, Inc., Industrial Homestead Building, New Orleans, and Henry Eggelhof, Construction Industries Building, Dallas, Tex., have been appointed representatives in their various districts for National Flue Cleaner Co., Inc., Groveville, N. J.

Pacific Coast

SAN FRANCISCO, July 18.—Plans are under way by Pacific Coast Pulp & Paper Co., Los Angeles, care of D. M. Thomas, Santa Monica, Cal., recently formed by Mr. Thomas and associates with capital of \$1,500,000, for new mill at Richvale, Cal., for production of paper from rice straw, consisting of main unit, 66 x 225 ft., and four smaller buildings, with power house, 50 x 80 ft., to cost in excess of \$400,000, with machinery. Wesley S. Martin, Los Angeles, is secretary and treasurer, and Mr. Thomas, president. C. A. Kieren is superintendent and engineer.

Board of Education, Burbank, Cal., has awarded general contract to A. D. Paschall, 1661 Forest Street, Pasadena, Cal., for new junior high school with manual training unit, to cost about \$200,000, to be known as New Valley Junior

High School. Francis H. Rutherford, Mills-Fraser Building, Santa Monica, Cal., is architect.

Victor Talking Machine Co., Camden, N. J., has engaged William A. Knowles, 1214 Webster Street, Oakland, Cal., architect, to prepare plans for its plant at Hollywood, Los Angeles, for development and manufacture of equipment for talking motion pictures. Initial unit will approximate 30,000 sq. ft. of floor space and will cost in excess of \$200,000 with equipment.

Marconi Mfg. Co., Seattle, manufacturer of radio equipment and devices, has awarded general contract to Hoard Engineering Co., Pantages Building, for new plant, to cost approximately \$55,000 with equipment. Hancock & Lockman, Walker Building, are architects.

Conveying machinery, loading equipment, motors and other power equipment, will be installed in new packing plant to be constructed by Irvine Valencia Growers Association, Tustin, Cal., to cost about \$85,000.

Yellow Cab Co., 1290 Bush Street, San Francisco, has awarded general contract to Cahill Brothers, Inc., 206 Sansome Street, for three-story service, repair and garage building to cost \$350,000 with equipment. Powers & Ahnden, 605 Market Street, are architects.

Fir-Tex Insulating Board Co., Portland, Ore., is considering plans for new insulating board mill in St. Helens, Ore., district, using sawmill waste as raw material. It will include power house, machine shop and other buildings, to cost more than \$1,000,000 with machinery. A. E. Millington, Portland, is vice-president and general manager.

Edwards Mfg. Co., Spokane, Wash., and Cincinnati, manufacturer of sheet metal specialties, has awarded general contract to P. J. Young, West Cleveland Street, Spokane, for one-story plant to cost about \$45,000 with equipment.

W. S. Ray Mfg. Co., Milton and Bosworth Streets, San Francisco, manufacturer of ranges, oil burners and kindred heating equipment, is having plans drawn for one and two-story addition, to cost about \$75,000 with equipment. Irvine & Ebbets, Call Building, are architects.

Alameda Airport, Inc., 550 Howard Street, San Francisco, is having plans drawn for a new airport at Alameda, Cal., comprising nine hangars, repair and reconditioning shops and other units, to cost more than \$65,000. E. G. Burr, address noted, is engineer.

H. D. Carter and Robert C. Oliphant have formed Carter Specialties Co., with headquarters in Hobart Building, San Francisco. It has recently been appointed northern California distributor for Leadclad products manufactured by Wheeling Metal & Mfg. Co., Wheeling, W. Va. A stock of flat and corrugated sheets is being carried by the company.

Plant and property of the Republic Steel Co., 733 Brannan Street, San Francisco, has been purchased by George R. Bormann Steel Co., Oakland, which will continue operations under latter name. Approximately 1200 tons of material has been taken over and the company is now one of the largest distributors of steel products on the Pacific Coast.

St. Helens Iron & Marine Works, St. Helens, Ore., has been sold to H. W. Clark, Kelso, Wash. New company will be known as St. Helens Welding & Machine Works, and will be operated by Mr. Clark, who also owns Clark Welding Works, Kelso and Longview.

Canada

TORONTO, July 23.—In addition to a steady flow of single tool orders, several orders were closed the past week for lists of from six to a dozen tools, and inquiries are out for other lists which will be placed before the end of the month. Business so far this month shows general improvement over that in July last year.

General Motor Corporation of Canada will shortly be in the market for tools and equipment for its new western Canada plant under construction. Purchases are being made for Point St. Charles shops of Canadian National Railways. Link-Belt, Ltd., Toronto, is preparing lists for equipment for a proposed machine shop. Canadian General Electric Co. has still to purchase tools, etc., for an addition to its Peterborough, Ont., plant now under construction. Public Utilities Committee, Winnipeg, will soon call for bids for power development machinery.

International Nickel Co., Sudbury, Ont., has started excavation work for a new smelter, construction to be started in about a month or six weeks. It will have a capacity of 3000 tons daily. A concentrator mill will also be erected.

Township Council, Scarboro, Ont., has purchased site on Massey Creek for a sewage disposal plant. Bids for equipment and construction are being received by W. D. Annis, town clerk, 1683 Kingston Road, Toronto.

Canadian Paper Board Co., Commissioner Street, Toronto, has taken out a permit for erection of a power plant to cost \$70,000.

In connection with a one-story plant, 100 x 400 ft., for Service Station Equipment Co., Ltd., 510 King Street East, Toronto, separate tenders are being received by D. Brouse, architect, care of company, for construction work, excavation, masonry, structural steel, steel sash, sheet metal, etc.

General Motors of Canada, Ltd., Oshawa, Ont., is having plans prepared by Hutton & Souter, 6 James Street, Hamilton, for an assembly building and power plant in connection with its plant at Walkerville, Ont.

Galt Art Metal Co., 385 Dundas Street, Galt, Ont., has awarded contract to A. Schnarr, 48 William Street, Waterloo, Ont., for a one story addition, 50 x 125 ft., mill and brick construction. B. A. Jones, 14 Ontario Street, Kitchener, Ont., is architect.

Western Canada

Harold A. Brown, secretary-treasurer, of town of Drumheller, Alta., will receive bids until Aug. 6, for one 1000 Imperial gal. per min. centrifugal pump and motor and other equipment for waterworks plant.

Foreign

PLANS are being arranged by El Aguila Petroleum Co., Minatitlan, Mexico, for extensions and improvements in oil refinery to double approximately present capacity, to cost more than \$2,500,000 with equipment. Company also purposes to build a new pipe line from recently established oil wells on Isthmus of Tehuantepec to refinery.

Department of Public Works, Government of Austria, Vienna, is considering construction of hydroelectric power plants on Danube River, and three sites for such number of individual plants are under advisement. Information at office of Bureau of Foreign and Domestic Com-

merce, Washington, reference Austria No. 281897.

Marioupol Iron Works, Marioupol, Russia, understood to be an interest of Soviet Russian Government, Petrograd, has plans for new plant for production of iron pipe, for oil field and other service. Initial project is estimated to cost \$4,000,000, and ultimate works about three times that sum. American Russian Chamber of Commerce, 145 West Fifty-seventh Street, New York, has information of project.

Department of Public Works, State of Sao Paulo, Sao Paulo, Brazil, is arranging for early sale of bonds in United States, totaling about \$15,000,000, proceeds to be used for extensions and improvements in water system of City of Sao Paulo, including installation of pumping machinery and other power equipment, pipe lines, etc., and for extension of Sorocabana Railway to Port of Santos, with terminal and shop facilities.

Government of Netherlands, Rotterdam, is considering establishment of new plant near State mine Maurits, Lutterdau, Province of Limburg, for manufacture of synthetic ammonia. Initial project is estimated to cost \$5,037,000 with machinery. Netherlands Parliament has authorized initial appropriation of \$1,007,000 for work, and additional funds will be voted later. Information at office of American Consulate, Rotterdam, Eugene W. Nabel, vice-consul.

Ulen & Co., 120 Broadway, New York, contractors, affiliated with a group of international contractors at London, England, and other points, have secured a contract from Persian Government, Teheran, for construction of railroad from Khor Musa, on Persian Gulf, to point on Caspian Sea, about 1000 miles, to cost \$125,000,000 with rolling stock, repair and construction shops, division yards, etc. Contract calls for completion of first 100 miles within 18 months. Road will pass through Teheran and Hamadan.

New Trade Publications

Carbic Lights and Carbide Generator.—Oxweld Acetylene Co., 30 East Forty-second Street, New York. Booklets, 3½ x 6¼ in., describing the use of cylindrical cakes of compressed calcium carbide in special portable generators for producing acetylene at low pressure for cutting and welding operations, and the various styles of burners and reflectors suitable for flood-lighting construction work.

Truck-Type Tractor.—Monarch Tractors Corporation, Springfield, Ill. Folder of eight pages devoted to a tractor capable of producing 78 drawbar hp. and weighing 22,500 lb. Illustrations show the equipment in use.

Jig Boring Machines.—R. Y. Ferner Co., Washington. Novel 11-page booklet bearing the title "Questions to Ask Before Buying a Jig Boring Machine." Features of the jig borers of the Societe Genevoise d'Instruments de Physique, Geneva, Switzerland, of which the Ferner company is representative, are dealt with in answer to some 80 questions in the booklet.

Pure Iron Plates.—American Rolling Mill Co., Middletown, Ohio. Twenty-page pamphlet, 8½ x 11 in., describes the pure iron plates which the company rolls for water supply and other engineering projects in which resistance to corrosion is a main consideration. Illustrations show Armco plates used for fusion welding, for stacks and breeching, gas coolers, standpipes, tanks and other long service work.

THE IRON AGE

New York, August 2, 1928

ESTABLISHED 1855

VOL. 122, No. 5

Web of Conveyors Serves Factory

Unusual Combination of Straight Runs, Curves, Spirals
and Heavy Grades—Upper and Lower
Runs of Belt Both Utilized

BY BURNHAM FINNEY*

ONE of the foremost factors in reducing costs in plants operating on a basis of mass production is an efficient system for handling materials. The kind of equipment best suited to this purpose is apt to vary according to the specific requirements of each company. In many cases a combination of standard conveying machinery and specially designed apparatus, adapted to local conditions, secures the best results.

At the new plant of the Kelvinator Corporation, Detroit, manufacturer of Kelvinator electric refrigerating units and of Nizer ice cream cabinets, provision has been made in practically every department for transporting materials mechanically. In fact, the plant resembles a large web woven of various transportation lines. Although this system has been in operation only a short time, it has already effected substantial economies.

It is no exaggeration to say that materials are carried through the entire plant without hand labor, from the time they reach the receiving department until finished refrigerating units are shipped to customers. Conveyors even extend the length of the stockrooms, so that materials, moving from this central point to any department in the plant, are transported by mechanical methods.

Units of Several Types Employed

WHILE roller and motor-driven belt conveyors predominate, materials are not handled exclusively in that manner. An overhead monorail system and electric lift trucks are utilized for certain types of work. Whenever materials must be sent from one floor to another, they are taken on spiral gravity conveyors, on "booster" inclined motor-driven conveyors or on automatic pendant-type vertical elevators.

The manufacture of electric refrigerating units lends

UNUSUAL flexibility features the conveyor system in the Kelvinator plant. Tote boxes, sent up or down the system as need be, are emptied of their products at proper points and placed back in the system, so that they do not pile up anywhere. Trays for special materials are designed to fit the boxes. Thus the loading and unloading, as the boxes pass a given point, are simple matters. At certain points electric lift-trucks and other equipment are used, but mainly the manufacturing process relies upon the conveyors, which are booster or belt or roller gravity, as immediate circumstances require.

itself well to straight-line production. Arrangement of operations is much like that in automobile factories, with sub-assembly lines feeding main assembly lines, which in turn supply a final assembly line. In practically all departments in which there is a sub-assembly or final assembly of parts, the work is done along motor-driven belt conveyors the movement of which is timed to conform to the necessity of the various operations. In the compressor assembly department, for example, the action of the belt conveyor is regulated so that the crankshaft, valves and pistons can be fitted to the cylinder block by workmen stationed at points along the conveyor. The same is true of the thermostat assembly department and of the

departments in which pressure controls, water valves, shut-off valves, expansion valves and float valves are assembled.

In the production of refrigerating units it is necessary to move from department to department hundreds of small parts. One of the most difficult problems confronting the management of the company was to find the most economical means of transportation for them. The plan finally adopted provided for standard all-steel tote pans, each measuring 14 in. in width, 19 in. in length and 11 in. in depth, and capable of carrying a maximum weight of 200 lb.

These pans, when once placed in service on the conveying system, remain in constant use and are not removed except at the end of the conveyor in the stockroom, where, after being emptied, they are transferred by hand to the lower run of the conveyor to move immediately back into the various departments of the plant. In many cases they are loaded with stock to go to assembly operations before being placed on the lower run of the belt. Holders, fitting snugly into the tote pans, are provided for each kind of part to be transported. The workmen remove these holders,

*Resident editor at Cincinnati for THE IRON AGE.

GRAVITY Conveyor Along Left Wall (Third Floor) Receives Tote Pans from Booster from First Floor and Passes Them to Belt Conveyor Through Center of Stockroom (Shown Also in View Below.) Tote pans coming to belt from right are from vertical elevator. Pans returned on lower run of belt are deflected to either side on roller spirals. Man in center is operating deflector

Floor Plans Show Interconnecting Units of System

CONVEYORS Connecting the Three Floors Are Shown in Red on the Diagram. The floors are shown one above the other as they occur in the building, the one at top of page being the top floor. Materials, received at left end in lower floor, are placed on conveyor at *A* to go to the stockroom. At *B* they pass up through the floor to the second story on a booster conveyor with 30-deg. grade. This carries them through the second floor (*BC*) and to the third floor where, at *D*, the material is delivered to the belt conveyor *EF*, running lengthwise in the stockroom. A short conveyor *G* facilitates distribution of some of the material. From the stockroom, material going to various departments is placed on the lower run of the belt conveyor *EF* and may be switched off at either *L* or *P*, both of which lead down through the floor at 15-deg. slope into spirals on the second floor, which is the assembly department. What goes over *L* traverses the spiral *M* and is delivered to the belt conveyor *MN*. What goes over *P* traverses the spiral between *P* and *Q* and much of it is delivered on the line *RS*, which at *S* again goes down through the floor at 15-deg. grade to the first floor. Here, after making a loop and a spiral, the conveyor ends at *T* in the machine shop. Another conveyor *UV* in the assembly department takes other material to the other end of the machine shop, going down through the floor at 15-deg. grade at *V*. This traverses another spiral on the first floor, coming out at *W* and then, over a belt conveyor, feeds the line *X*, which leads to the automatic elevator. This elevator carries material up through the three floors, with delivery at each floor. In the stockroom it deposits material on the conveyor at *H*. This conveyor eventually leaves this floor at *J*, going down through the second floor over another spiral and ending up at *K*. All of these spirals are 11 ft. in diameter and of 3 to 3½ ft. pitch and are fitted with rollers, so that gravity carries the material downward in tote boxes

ROLLER Spiral on Second Floor (Below) Receiving from Gravity Conveyor Shown on Lower Left of Photograph at Top of Page 266. Note deflector, switch and switch arm, which are operated from floor above to discharge to gravity conveyor in foreground or to threaded belt. On loading table is shown the form of holder by means of which various parts are shipped in the tote pans

or racks, from the tote pans, but do not impede the movement of the latter.

Stockroom Control of Tote Pan Movement

ROUTING of the tote pans is regulated chiefly from the stockroom. Material to be delivered from stock to sub-assembly departments is placed in tote pans and sent out from the stockroom on the belt conveyor. This delivers it to spiral gravity conveyors connecting with various belt and gravity conveyors running into the sub-assembly departments. When the tote pans have gone the length of the assembly line to which they are assigned, and have been emptied of their contents, they may be held for use at the inspection point. If they are not needed there they may be returned to the stockroom for rerouting.

Raw stock coming into the plant is carried by means of an inclined conveyor from the receiving department on the first floor to the third floor, where the stockroom is located. The conveyor is equipped with standard pusher bars and runs at a speed of 60 ft. a minute. It delivers the stock, always in tote pans, to a gravity roller conveyor discharging on to a belt conveyor moving down the center of the stockroom. The belt conveyor consists of an upper and a lower run, material moving into the stockroom on the upper run and passing out on the lower.

Assembly work is done principally on the second floor. Material is delivered from the stockroom on the third floor to the belt conveyors along the assembly lines by means of spiral gravity conveyors, and assembled parts are carried to the storage and shipping departments on the first floor in a similar manner. The general plan of having material go from the first to the third floor and thence to the second and again to the first has been followed in laying out production lines in the plant, and the entire conveying system has been designed to conform to and facilitate this arrangement.

Special Arrangements Facilitate Some Operations

IN certain cases provision has been made for special carriers. For example, compressor units, after being painted, are placed on a special carrier suspended from an overhead monorail conveyor running into a continuous-type dehydrating oven. The carrier has three shelves, the bottoms of which are perforated so that material resting on them can dry easily. When the compressors come from the oven they are removed from the carrier and are tested under gas pressure for leaks. They then are charged with oil and are put on an overhead conveyor for delivery to the final assembly department, where they move into the condenser assembly line.

For the silent testing of compressors after assembly a special room has been set aside on the third floor. Compressors are carried there from the end of the assembly line on the second floor by means of an overhead chain conveyor.

Ice cream cabinet condensers are assembled on a continuous roller conveyor, but, on account of their bulk, weight and the peculiar requirements of the assembly operations, they are pushed by hand from one position to another. At the end of the assembly line they are placed on specially designed carriers and are moved on a monorail conveyor into a baking oven. From the oven they are transported on a vertical conveyor to the charging room on the floor below, where they are charged with sulphur dioxide and oil. From this point delivery is made by roller conveyor to the department where the condensers are assembled into the holding cabinets. Still on the roller conveyor, the unit is tested and then is sent to the crating room and to the warehouse for shipment.

Automatic Elevator Takes Machined Parts to Stockroom

MACHINED parts from the machine shop are delivered by means of a gravity roller conveyor on to an automatic pendant-type vertical elevator, to be taken

to the stockroom on the third floor. This stockroom serves for storage of both raw materials and finished parts ready for the assembling operations. The elevator is motor driven, and the loading stations at each floor are cable-controlled and are properly interlocked to prevent jamming the elevator. If the elevator is being loaded at the first floor, for instance, the loading stations on the second and third floors are locked so that no material can be fed on to the elevator.

The elevator, which loads and unloads automatically, is equipped with metal carriers each of which is just large enough to accommodate comfortably one of the tote pans. These carriers are spaced about 8 ft. apart and their speed can be regulated so as to conform to the movement of the tote pans discharging on to them.

Through the machine shop runs a belt conveyor along which parts in process move from one operator to the next. The lower run of the conveyor is used to carry chips from the machine shop, the chips being gathered in the tote pans.

Monorails are employed rather extensively, when they afford better facilities for transportation than roller or belt conveyors. For example, in addition to being used in carrying material into and through dehydrating ovens, monorails bring flywheels from the paint room and radiators from the sub-assemblies to the unit assembly department. Furthermore, a monorail has been erected through the stockroom and through the radiator, condenser coil, evaporator and tank assembly departments.

Considered as a whole, the system, which was designed and installed by the Kelvinator engineers, is comprised of 44 different units, many of which dovetail into each other. It has made possible the movement of materials at whatever speed or in whatever quantities are called for by production schedules, without the necessity of employing a constantly fluctuating number of workmen. The permanent decrease in the amount of man power has been sufficient in itself to account for a large reduction in costs. However, to state that these savings are all that has been accomplished would be omitting mention of the most important results. It has made practicable the economical manufacture of refrigerating units on a mass production basis, an achievement which would have been impossible of attainment were it not for the comprehensive mechanical transportation lines connecting the various operating departments.

Measures Temperature of Welding Flame

At the meeting of the Verein Deutscher Ingenieure, held at Essen, June 9 to 11, Prof. A. Henning described his experiments on the temperature of the oxy-acetylene flame. According to an abstract of the paper published in *Engineering*, the temperature was measured by Kurlbaum's methods, the flame being colored for that purpose with lithium carbonate. The flame was measured at a number of places at different heights above the edge of the burner and at different distances from the vertical axis. The proportions of acetylene and oxygen used were also altered. The maximum temperature, 3100 deg. C., was obtained with the ordinary proportion of 1:1 used in welding blowpipes. The acetylene pressure was 7 lb., and the oxygen pressure 45 lb. per sq. in.

Handling of Personnel

Industrial accidents, factory management, hours of work, fatigue and rest periods, lighting, heating, ventilation and sanitation are discussed in a 48-page mimeographed pamphlet issued by the Library of National Bureau of Casualty and Surety Underwriters, 1 Park Avenue, New York. It was prepared by Mildred B. Pressman and includes a review of general literature on these subjects, and literature on their relation to the questions of safety and production.

Carbon Deposition Near Furnace Top

No More Than a Third Can Come from Volatile Matter in Coke; Remainder Must Come from Blast Furnace Gases Themselves

BY F. C. HOWARD*

IT is generally acknowledged that the manufacture of pig iron is the very basis of the steel and ferrous alloy industries. Therefore any information on the chemical reactions involved is not only of scientific importance but may be of real economic value. A thorough understanding of these reactions is essential for the proper design of blast furnaces, and should be of real benefit to the furnace operator.

Many textbooks and articles speculate as to the reactions taking place and show the complete equations, but fail to take into consideration the steps involved or the rate of reaction and the equilibrium constants. However, there is much valuable data in the literature in which the physical chemistry involved has not been considered. Recent work done by the Bureau of Mines in the Birmingham district is of real interest and significance.

In Technical Papers No. 397 and 391, entitled "Composition of Materials from Various Elevations in an Iron Blast Furnace" and "Iron Blast Furnace Reactions," by S. P. Kinney, P. H. Royster and T. L. Joseph, tests are described which sampled both gases and solids at different levels in the iron blast furnace for a period of many days. The gas analyses represent the average of 1000 tests and should be fairly representative of furnace operation. The results are shown in Table I:

Table I—Gas Analyses at Different Levels in the Blast Furnace

	Height Above Tuyeres	Temp. Deg. C.	Per Cent by Volume			
			CO ₂	CO	H ₂	N ₂
Top Gas.....		168.0	9.9	28.1	2.0	60.0
Plane No. 1.....	60 ft. 4 in.	204.0	10.3	27.0	1.87	60.8
Plane No. 2.....	53 ft. 4 in.	465.5	12.1	26.5	1.69	59.7
Plane No. 3.....	41 ft. 9 in.	745.0	9.0	28.6	1.64	60.7
Plane No. 4.....	19 ft. 3 in.	853.0	1.1	33.6	0.8	64.5
Bosh.....		1350.0	0.0	34.1	0.79	65.1

It should be noted in connection with the above table that the CO content decreases steadily to a point 53 ft. 4 in. above the tuyeres, after which it begins to increase. The CO₂ content is zero at the bosh, increases steadily to the same point and then falls off. It should also be noted that percentages are given by volume, which is equivalent to molecular percentage.

We can assume that the nitrogen comes from the air and goes through the furnace unchanged. That the amount of nitrogen coming into the furnace with the coke is negligible is apparent from the following computations:

- Burden: 2626 lb. coke; 2240 lb. iron; 9695 lb. air.
 Analysis of coke: 0.6 per cent nitrogen; 1.0 per cent volatile.
 Molecular weight air assumed at 29 (79.1 per cent nitrogen).
 Molecular weight nitrogen is 28.
 Mols air in blast = $9695 \div 29 = 334$.
 (a) Mols nitrogen in blast = $334 \times 0.791 = 264$.
 (b) Mols nitrogen in coke = $2626 \times 0.006 \div 28 = 0.56$.
 Proportion (b) to (a) = $0.56 \div 264 = 0.00213$.
 Correction for nitrogen in coke assuming all of it goes to gas
 $60 \times 0.00213 = 0.128$, a negligible correction.

The gas analyses were then recalculated on a basis of 60 mols of nitrogen and the results are shown in the following table:

Table II.—Gas Analyses at Different Levels in Blast Furnace Mols of Gas per 60 Mols N₂

	CO ₂	CO	H ₂	N ₂
Top Gas.....	9.9	28.1	2.0	60.0
Plane No. 1.....	10.2	26.7	1.85	60.0
Plane No. 2.....	12.2	26.6	1.70	60.0
Plane No. 3.....	8.9	28.3	1.62	60.0
Plane No. 4.....	1.0	31.2	0.74	60.0
Bosh.....	0.0	31.4	0.73	60.0

A recalculation of these analyses on the basis of 60 mols of nitrogen shows the total carbon in the gas and is given in Table III.

Table III—Total Carbon in Gas—Mols per 60 Mols N₂

Position	Total Carbon	Position	Total Carbon
Top Gas.....	38.0	Plane No. 3.....	37.2
Plane No. 1.....	36.9	Plane No. 4.....	32.2
Plane No. 2.....	38.8	Bosh.....	31.4

It is of real significance to note that the total carbon in the gas increases steadily from the bosh to Plane No. 2. At Plane No. 1 the total carbon decreases and then increases in the Top Gas. This would seem to indicate that there is a deposition of carbon between Plane No. 1 and Plane No. 2, a fact which was brought out in the oxygen calculations of Technical Paper No. 391, cited above.

A calculation shows that this increase between Plane No. 1 and the top of the furnace cannot be due to carbon coming from the volatile matter. Coke is 1 per cent volatile. Assuming a formula for this volatile matter to be n(CH₂) it is 86 per cent carbon.

$$\begin{aligned} \text{Mols carbon from volatile} &= 2626 \times 0.01 \times 0.86 \div 12 = 1.88. \\ \text{Molecular proportion carbon from volatile to nitrogen} \\ \text{from blast} &= 1.88 \div 264 = 0.0071. \\ \text{Total carbon from volatile per 60 mols N}_2 &= 0.0071 \times 60 = 0.4. \end{aligned}$$

Total carbon in top gas from Table III is 38.0 mols and 36.9 at Plane No. 1, or an increase of 1.1 mols. Compare this with 0.4 mol of carbon which it might have received from the coke as volatile matter.

This work strongly indicates that the deposition of carbon in the top of the blast furnace comes from the blast furnace gases themselves. In this particular case it amounts to 1.9 mols as compared with 0.4 mol that might be deposited from volatile matter in coke, and hence is greater in amount than would be obtained if volatile matter only were decomposed.

The following table shows the total mols of gases per 60 mols of N₂, exclusive of N₂:

Table IV—Mols of Other Gases per 60 Mols N₂

Position	Total Gas Except N ₂	Position	Total Gas Except N ₂
Top Gas.....	40.0	Plane No. 3.....	38.8
Plane No. 1.....	38.8	Plane No. 4.....	32.9
Plane No. 2.....	40.5	Bosh.....	32.1

It will be noticed that there is an increase from 32.1 to 40.5 mols in the total gases from the bosh to Plane No. 2, then a decrease of 1.7, after which it returns to 40. In other words, the total volume of gases leaving the furnace is not as great as that present in the furnace at Plane No. 2.

There is no apparent reason for a variation of 1.1 mols of carbon in the gases between Plane No. 1 and the top gas (Table III). Either there are reactions involving carbon which we have not considered or the furnace was not running at a uniform rate. Considering the size of the equipment, variation in material, differences in the technique of the operators and other incidentals, the latter presumption may be correct. If such is the case, the use of these data for a qualitative study of the reactions of the blast furnaces are of value, but it would not be so safe to use them for quantitative deductions about the furnace's reactions.

United States Rolling Mill Capacity

Compilation of Rated Outputs of Leading Forms of
Steel in Each of Twelve Districts
of the Country

THREE years ago last January THE IRON AGE published several pages of tables and a map showing the location and capacity of all of the steel rolling mill units in the country. The tables indicated the subdivision of the rolling capacity for each type of product, showing how much could be produced at each plant in each district under each class of product. The total rolled capacity was there computed, as of Dec. 31, 1922, at 43,157,845 gross tons.

The figures have now been brought up to date. Reference was had to the 1926 directory of the American Iron and Steel Institute—the latest comprehensive publication of that character, and, in addition, verification or correction was made by more than 200 companies for the individual figures appertaining to those companies.

Representing as nearly as possible the situation on Jan. 1, 1928, the tables and diagrams shown herewith indicate the capacity of various districts and how those districts are equipped to various forms of steel. The total capacity appears to be 52,196,000 tons, or 21 per cent greater than five years earlier. The districts, somewhat loosely drawn, are shown on the map.

One of our diagrams shows the relative capacity of the different districts in the production of nine specific, leading items. Each circle has an area proportioned to the others in the ratio of the tonnage capacity of the different prod-

ucts. Except for rails, in which Chicago leads, the Pittsburgh district is the dominating influence in each product. Pittsburgh's share varies from 20½ per cent of the aggregate in sheets to 44 per cent of the tubular products. The Pittsburgh district has 26.9 per cent of the total capacity. Chicago's lead in rails is represented by 30.3 per cent of the total, against Pittsburgh's 23.4 per cent.

Another diagram shows the subdivision of the capacity of each district into the leading items of product. In most of the districts bars furnish the principal item. This reaches nearly 76 per cent in the small Eastern district, but drops to below 12 per cent in the Ohio River district. Plates take the lead in the Philadelphia district, while sheets in both the Wheeling and the Ohio River districts are ahead of all other products. In the latter, in particular, sheets account for more than 65 per cent of the total. Considering sheets and tin plate together, more than half of the total capacity of the Wheeling district is thus covered. Here, as in the other diagram, the area of each circle bears the same proportion to the other circles as the capacities of the respective districts.

While the total capacity for finished rolled product is placed at 52,196,000 tons, an increase of 21 per cent over the capacity at the end of 1922, no such increase has been made in the ingot production capacity of these plants. This is reported in the present table at 59,973,000 tons, against

Principal Products of Each District Are Shown at Top and Bottom of Page. Areas of circles are proportional to total capacity, district by district

55,522,000 tons for five years ago. The increase in ingot capacity has been thus only 8 per cent.

Figuring the ratio between rolled steel production and ingot production at 74 per cent, which is about the yield of finished steel which ingots have been producing in the past few years, the ingot capacity reported has called for a finished steel capacity of about 44,400,000 tons. The rolling capacity reported, however, is in excess of that amount by 17½ per cent.

This follows natural conditions, inasmuch as requirements vary from year to year, and rolling mill capacity always has to be in excess in the total of the probable requirements. Rail mills are thoroughly busy only a small portion of the year, and for the most part are not used for other products; similarly with other types of mills which are suited to only a narrow range of output. It happens, how-

ever, that the finished rolled capacity today is considerably further above the 74 per cent ratio to ingots than was the case five years ago. Evidently the several forms of steel made in a given plant are not likely to be simultaneously in full demand. Using the capacity figures given and the production figures for the various items as reported in *THE IRON AGE* of May 17, page 1401, we find that capacity was used in 1927 about in the following average proportions:

Rail making capacity at 62 per cent.

Plate mill capacity at 56 per cent.

Structural shapes at 83 per cent.

Merchant bars, etc., at 32 per cent.

Sheets at 62 per cent.

Tin plate at 81½ per cent.

Tubular products at 72½ per cent.

Wire products at 62 per cent.

Blowing Materials into Blast Furnace

German Experiments with Ore and Fuel Additions to Hearth Through Tuyeres—Problems Far from Solved

BLOWING ore and fuel into the hearth of the blast furnace was discussed in an interesting article in *Stahl und Eisen*. It was contributed by E. Bertram of the Halberger plant at Brebach-Saar, Germany, and gives a brief account of tests carried out at that plant since 1917.

Blowing in Dust Through Tuyeres

Tests were first made covering the use of flue dust. An arrangement was worked out by which flue dust could be taken from one of the large dust catchers and introduced into a pipe leading into the tuyeres. Details of the arrangement are not given. With good operation, the blast carried the flue dust smoothly into the furnace without producing dirty tuyeres. Also the dust production of the furnace did not increase even after long blowing.

From the first test it was observed that the dust exerted a cooling effect. If the furnace operation remained unchanged, it was not possible to produce No. 3 foundry iron, completely saturated with carbon. A partially saturated iron was made that was used directly for castings. As the chemical composition, otherwise, was hardly changed, the reason is probably to be sought in a change in the physical constitution.

Further it was noticed that, with the blowing in of large amounts of dust and with even furnace operation, the quality of the iron was not so good. The explanation is that an undesired lowering of hearth temperature is brought about. This can be avoided only by an increase of coke in the charge. Under the conditions at the Halberger plant, calculations based on tests showed that the blowing in of dust is economical, compared with briquetting, only when not more than 30.5 lb. of coke per ton of pig iron has to be added to the charge.

The process is economical only when the furnace is working with a great excess of temperature which has to be equalized with cold air additions to the blast. Whether it is to be recommended for the production of pig iron for steel making is to be doubted, as the reduction of manganese and other reactions will, without doubt, be influenced unfavorably.

The blowing in of fuels is much more difficult to carry out. After many failures a screw-feed was worked out that carried the material uniformly to the tuyeres and now from 10 to 50 per cent of the coke charge can be blown in as fuel additions. Tests showed that coal mud, raw coal, coke

dust and small coke cannot be used, at least so long as they are introduced into the chief blast main. In comparison with the effect produced by putting blast from a hot stove on to a cold working furnace, that produced by blowing in dry coke dust is sadly wanting. What is needed in such a case is not more fuel, but higher temperature. Blowing in cold fuel lowers the temperature. So long as oxygen is not mixed with the air nor the fuel preheated, this will always be the case.

The tests at the Brebacher plant have shown that the hope is unfortunately only a dream that, when a feeding arrangement of fuel to the hearth was worked out, a blast furnace would operate like a machine. Also the blowing in of cheaply made producer gas above the tuyere level appears to be an untenable practice. There remains only the hope that flue dust and fuel can be blown into the shaft of the furnace. In this way the cost of briquetting will be saved and the material will be preheated when brought into the hearth. However, the necessary arrangements cost money and the heat balance of the furnace requires that, with a large amount of flue dust addition, a corresponding increase of coke be made to the charge.

Results Summarized

The author's summary is that the blowing in of ore or flue dust gives rise to no difficulties with a blast furnace working under low pressure. It is not a suitable practice for the production of high-quality foundry iron or irons high in manganese, and is economical only if one is running with the object of producing gas or if considerable cold blast has to be used to equalize temperature.

Blowing in fuel gives rise to operating difficulties. Tests and theory show that the process is unworkable so long as fuel is introduced into the main blast line. There still remains the possibility of working out improved methods of introducing fuel to the furnace hearth. G. B. W.

"Getting Facts About Accidents," the second of a series of publications issued by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., New York, outlines current industrial practice in obtaining and using accident facts as a means of promoting plant safety. Accident forms are provided, which have been found helpful in recording the necessary facts and making them available for study.

Economies in Automatic Welding

Lowest Costs Require a Rapidly Melting Electrode of Proper
Size and Correct Balance Between Current Input
and Speed of Welding Head

BY M. W. BREWSTER*

HAVING adopted welding as a cheaper or more satisfactory process than others, the next question is, "How can welding operations be speeded up to obtain the maximum output at a minimum cost?" Naturally, quality must not suffer. In the following discussion, the principal variables affecting operating costs will be considered.

It will be assumed that (1) handling charges have been

and measure the welding variables when their regulation is automatically controlled. The principles discussed, however, are equally applicable to hand welding operation. It is interesting to note that the automatic welding machine originated as a piece of research apparatus for studying certain aspects of hand welding.

A bead on a flat plate was used because it eliminated other variables such as joint preparation, backing up, and

*Motor Drive and Gear Reduction Set

Driven Carriage for Making Long
Straight Joints. Carriage also carries
reel of welding wire, current
control, and indicating meters*

reduced to a minimum, (2) the clamps or other fixtures used for holding or moving the product while it is being welded are correctly designed, (3) if the welds can be backed up, it has been effectively done, (4) disturbing magnetic influences have been reduced to a minimum, (5) the material to be welded is flange quality steel and (6) the joints are properly assembled and, if necessary, beveled on the edges. These are either plant layout or machine design problems. Our investigation is confined to a study of reducing welding costs by a proper balance of welding conditions only.

The following motions, materials and conditions remain to be considered:

1. The rate of electrode feed.
2. The rate of travel along the weld.
3. The kind or type of electrode.
4. The diameter of the electrode.
5. The value of welding current.
6. The voltage across the arc.

In order to determine the optimum conditions, the rate at which a satisfactory bead can be laid on a flat steel plate, as affected by the above variables, was studied. An arc welding machine was used because it is easier to control

the need for giving special attention to magnetic disturbances. It is not assumed that a bead on a flat plate is equivalent to a weld in a joint, but regardless of whether a joint or bead is considered, if by raising the current increased speed can be employed, there will be a saving in welding cost. Likewise changes in electrode diameter and type of electrode may effect savings in welding. The object being as stated above, the use of a bead on a flat plate is preferable to some arbitrarily selected type of joint because fewer welding variables are involved.

The physical dimensions of a bead made with No. 1 wire, $\frac{1}{8}$ -in. diameter, using 190 amp. and a travel speed of 15 in. per min. was arbitrarily selected as a standard. This bead possessed the qualities generally required of satisfactorily deposited weld metal. Good appearance, adequate penetration and absence of noticeable porosity were considered sufficient evidence of a "satisfactory" bead. The limits of current and speed were considered as reached when any one of these suffered. Practically all the inspection was made without destroying the bead because it is believed that a

*Industrial Heating and Welding Engineering Department, General Electric Co., Schenectady, N. Y.

familiar type of weld or bead can be adequately judged without doing so, the same as the probable soundness of riveted joint can be determined without testing it to destruction.

Rate of Electrode Feed

If the motion of a hand arc welding operator is analyzed, it may be divided into travels in two directions: (a) along the direction of the weld, and (b) down toward the work in order to hold the arc length constant as the electrode is consumed. In automatic welding the second motion—that of feeding the electrode downward as it is consumed—is obtained by a wire-feeding device, easy to vary and capable of fine adjustment, called a welding head. The wire feed down through the vertical tubes, shown in the accompanying reproductions of photographs, is easily adjustable over a wide range by proper rotation of the two rollers with milled edges. Control is so devised that practically any predetermined voltage used in metallic arc welding can be held.

The rate of electrode feed depends primarily upon welding current and the melting rate of the electrode. This melting rate has an important effect on the ultimate speed at which a good weld can be obtained and will be considered further.

Rate of Travel Along the Weld

The travel along the weld may be obtained either by moving the work past the welding head or by mounting the welding head on a carriage that moves the head along the work in the direction of the weld. On a standard travel carriage, such as that shown, speed may be varied from 3½ to 80 in. per min.

It is desirable to observe certain important welding conditions. Too much emphasis cannot be placed on an even, smooth travel when working at the highest possible speed. To this end, final reduction of the movement should be through a worm gear. A small disturbance in any one of the welding conditions will result in a slower ultimate welding speed. Needless to say this travel movement should be easy to vary in small steps over and above the probable welding range. Uneven, jerky travel is particularly objectionable.

Melting Rate of Electrode

Of the many kinds of electrodes available, it is impossible to class any as definitely good or bad because of the lack of a standard for comparison. Some are good for one job, some for another. The proper plan is to select the one best suited for the particular job.

The first consideration, not only of the electrode problem in particular but of any welding job, is the qualities desired at the joint. The relative importance of strength, ductility and resistance to leakage or corrosion should be carefully considered. Other items that should be given attention are the design of the joint, the heat treatment, if any, and whether the joint is to be machined or ground.

In order to bring out another item often neglected, let it be assumed that several electrodes give welds that meet the conditions desired. Then select the one that will do the job at the highest speed. This depends not only on the electrode diameter and the welding current, but also on the melting rate of the electrode. Consideration of this factor is often neglected.

That the melting rate of the electrode differs may be seen from the curves in the accompanying chart, determined by making a satisfactory bead on a flat plate, as described. The diameters of the electrodes are identical and the metal of the two welding wires is of the same analysis. The electrodes differ in the fluxes used and the method of combining them with the electrode. The melting rate averages about 40 per cent less for No. I wire than for No. II. Similar results have also been obtained with one or two other types of electrodes.

Melting rate curves are seldom available to the shop foreman. It will be interesting to consider a case where these curves were not at hand. It was found that with 190 amp., ⅛-in. diameter electrode, and travel speed of 15 in. per min., a satisfactory bead could be obtained with No. I electrode, the wire feed being 14 in. per min. With No. II wire, and the same conditions otherwise, the wire feed was found to be 26 in. per min., indicating that the second electrode had 46 per cent greater melting rate. The bead made with the second type wire looked a little heavier but the apparent difference was slight.

The next step was to increase the current and travel speed on each type of wire until a limit was reached. With the first type of wire, the limiting condition for the kind of bead desired was 240 amp. at a travel speed of 18 in. per min.; with the wire with the higher melting rate, the limiting condition was 265 amp. and 24 in. per min. travel. It will be seen that the travel speed along the line of weld was 25 per cent faster when the electrode with the higher melting rate was used.

It is obvious from the example cited that, other conditions being equal, the melting rate is an important factor in speeding up production.

Larger Electrodes for Poorly Fitting Joints

In automatic welding, a ⅛-in. electrode is seldom used with a welding current over 200 amp.; hence in the above work a 3/16-in. electrode of the same type was tried using the same welding conditions as employed with ⅛-in. wire; namely, welding current 265 amp., and travel speed 24 in. per min. The electrode consumption with ⅛-in. wire was 44 in. per min., which, with a welding speed of 24 in. per min., gives a deposition of electrode of 0.076 lb. per ft. of weld. With 3/16-in. wire the electrode feed was 16 in. per min., which, with a welding speed of 24 in. per min., gives a consumption of 0.061 lb. of electrode per ft. of weld. These data illustrate that when the work consists of making a weld in abutting plates, and not laying down the

maximum amount of metal, it may be advantageous to increase the size of electrode because less electrode material is removed from the larger diameter wire at a given current and travel speed.

There are, of course, other factors equally important to be considered with reference to electrode diameter. Larger diameter electrodes permit heavier currents which tend to increase the speed. The type of joint also has a share in determining the electrode diameter. Poor fitting joints are uneconomical for welding when tight fitting joints can be made. In some few applications, however, it happens that the saving in welding cost does not justify the extra joint preparation to secure an altogether suitable fit. Small diameter wire, of course, can be used for a large bead, but will result in slower welding speed and very often a poorer quality of weld metal. In such applications where a considerable opening has to be filled or spanned by the weld it is generally found that the larger the diameter wire that can be used, the more satisfactory the finished product will be.

It is clearly shown in the chart that the melting rate of the electrode increases as the current is increased. This makes a given type of bead at a higher speed. It has also been shown that there may be a saving in electrode consumption by changing from a 1/8-in. to a 3/16-in. electrode, the welding current remaining the same. It will be shown later that an increased welding current resulted in a slightly higher electrode cost, but a decrease in the labor and power cost per foot of weld.

Voltage Across the Arc

The arc voltage is usually a measure of the length of the arc; the longer the arc the higher the voltage for any given type of electrode of a specified diameter. It is generally agreed that, although the proper arc length will not alone insure a good weld, a long arc generally results in a poor weld. With a short arc there is a greater heat concentration. With bare electrodes the long arc is more unstable than the short arc; the greater the arc length the more opportunity for the absorption of oxygen and nitrogen by the weld metal. This absorption is detrimental to the quality of the weld.

Because of the better control of conditions possible with the automatic arc welding machine, stable conditions can be obtained with longer or shorter arcs than can be held by the average hand welder. With all other conditions except the arc voltage at the same value, it will be found that a short arc makes a narrower bead with a higher crown and a sharper curvature. As the arc length is increased, the bead widens out and flattens down until either the arc becomes unstable or the quality of the bead suffers from excess absorption of gases from the atmosphere. Whether a limit is first reached to the flatness of the bead or to the quality of weld metal is dependent, to a large extent, on the type of electrode used—highly fluxed electrodes generally permit the use of higher arc voltages.

Calculation of Costs

Three principal items to be considered in calculating welding costs are labor, electrode material and power.

Since the greater amount of welding, particularly automatic welding, consists of making linear joints or seams, cost calculations will be based on the cost per linear foot. The welding data used will be that employed in the preceding portion of this discussion, assembled in the table.

In order to bring out the points illustrated in the earlier part of this article, the data have been divided into four groups. Group A compares the melting rate of No. I and No. II wire. Group B gives the conditions of the highest speed with 1/8-in. diameter wire of both types. Group C illustrates the saving effected by changing to larger diam-

eter of electrode, other conditions remaining the same, and Group D shows the economy of increasing the current to obtain high welding speeds. This last point may also be illustrated by comparing the results with No. I wire in Group A with those of No. I wire in Group B. The same comparison may be made with No. II wire in these same groups.

In calculating electrode costs, the following electrode

Curves Showing Melting Rates of 5/32-In. Electrodes of Different Types

weights were used:

- 1/8-in. electrode.....0.0409 lb. per ft.
- 3/16-in. electrode.....0.0902 lb. per ft.

Power costs in general are calculated by finding the kilowatt input to the motor-generator set for a given welding current. To obtain this, it is necessary to have the efficiency curve of the motor-generator set used.

The following formulas give cost per running foot of weld:

To find the electrode cost in dollars per foot of bead multiply the electrode feed in in. per min. by the weight of the electrode per ft. of bead and by the electrode cost in dollars per pound, and divide the running product by the travel speed in in. per min.

To find the cost of electrical energy in dollars per foot of bead multiply the kilowatt input to the motor-generator set by 12 times the cost of the electrical energy in dollars per kw hr., and divide the product by 60 times the travel speed in in. per min.

To find the cost of labor in dollars per foot of bead divide 12 times the rate in dollars per hour by 60 times the travel speed in in. per min.

If hand welding instead of automatic welding were to be considered, the electrode consumption would be greater because 15 to 20 per cent of each length used is discarded. In automatic welding, this is eliminated by a continuous wire feed from a reel.

The usual hour rate for hand welders is within the range covered by the labor costs assumed above, but the welding speed of hand welders on a job to which automatic welding can successfully be applied is only 1/3 to 1/2 the speed of the latter.

Test, performance and manufacturing standards of electrical apparatus have been published by the National Electrical Manufacturers Association, 420 Lexington Avenue, New York, as the NEMA Handbook of Apparatus Standards, formerly known as the Electric Power Club Handbook of Apparatus Standards. The book embraces standards of electric power, control and measuring apparatus for the generation, distribution and utilization of electric energy.

Establishes Steel Foundry Laboratory

Large Company's Equipment for Research—High Frequency
Electric Melting Furnace, Testing and Heat-
Treating Equipment Available

FROM the standpoints of location, construction, equipment and personnel the new research laboratory of the American Steel Foundries serves well as an example of the growing tendency in American industry to search out, with the support of adequate laboratory facilities, methods and materials to satisfy the increasingly exacting demands of purchasers.

The laboratory is located at the East Chicago, Ind., plant of the company, in a building constructed during the war, when it served as a power plant for a forge shop, which has been dismantled. As the power house was located on the opposite side of the forge shop from the foundry units, the laboratory is now 300 yd. away from the nearest manufacturing building.

The framework of the laboratory building is of steel, and the walls are brick filled. The roof trusses are overlaid with cement tile, and the column and wall foundations are of concrete. Of special interest is the fact that the massive foundations, which formerly supported power machinery, are now being used most satisfactorily as testing machinery bases, affording a degree of rigidity which is often highly essential for work calling for a high degree of accuracy.

About one-half of the structure, which is 36 ft. wide by 320 ft. long, is now used for laboratory purposes. A 100 per

cent expansion in floor area is therefore possible without additional constructional expense.

Photomicrographic equipment, which is located in a separate room, was furnished by E. Leitz, Inc., New York. It allows a magnification of 10,000 diameters. Ordinarily the work performed calls for a magnification of 100 to 1000 diameters, with an occasional magnification of 5000 diameters. This apparatus is equipped for photomicrographic work on specimens up to 8 in. square in actual size. The machine is equipped with shock absorbers, though there has been no occasion for their use on account of the massive foundation.

Adjacent to the microscopic room is a locker room and across the hall is a chemical laboratory. These departments, including offices and a library, occupy the north half of that portion of the building now in use. The remaining half is occupied by a workroom in which are located the melting units, the heat-treating units, the machine shop and the physical testing laboratory. In general the arrangement provides for the location of testing machines at the north end and along the east wall. Near the middle of the room and along the west wall is a well-equipped machine shop. At the south end of the room are located the melting furnaces and the heat-treating equipment.

Physical testing apparatus consists essentially of the fol-

THE Physical Testing Laboratory Contains a Wear Testing Machine, a 100,000-Lb. Riehle Testing Machine, an Izod Impact Testing Machine, a Fatigue Testing Machine, a Rockwell Dilatometer and Brinell Rockwell and Scleroscope Hardness Testing Machines. There is also equipment for preparing specimens for tests

TWO Electric Melting Furnaces (at Right) and Three Heat-Treating Furnaces (at Left) Have Been Provided

lowing machines: An Amster Frères wear testing machine is in continuous service. Instead of the load being applied with a spring, as originally designed for the machine, a floating load has been substituted in order to maintain a constant load as the specimens wear. An electric blower has been installed to keep the specimens from heating. The Riehle Brothers Testing Machine Co. furnished a 100,000-lb. testing machine and an impact testing machine of the Izod type. There is also an R. R. Moore fatigue testing machine, built by the Thompson Grinder Co., Springfield, Ohio. Fatigue tests are run at a speed of 1800 r.p.m. on specimens approximately $\frac{3}{10}$ in. in diameter at the center. Weights are added whereby a load of about 80,000 lb. per sq. in. may be applied.

Other equipment includes machines for preparing specimens for microscopic work and Brinell, Rockwell and scleroscope hardness testing apparatus. A dilatometer, which was furnished by the Stanley P. Rockwell Co., Hartford, Conn., is used to determine the expansion and contraction of specimens when subjected to heat and cold.

Machine tools are all driven by individual motors. They include a bench lathe, a 20-in. x 48-in. engine lathe, a 14-in. x 36-in. lathe, a metal band saw, a 16-in. shaper, a drilling machine and a grinder.

Special Melting Furnaces

Two melting furnaces have been provided, one of the carbon pile resistance type and the other an induction furnace. The latter was constructed by the Ajax Electrothermic Corporation, Trenton, N. J., with electrical supplementary equipment of General Electric manufacture. This induction furnace has a melting capacity of 100 lb. in 45 min., and heats of 150 lb. can be made. The furnace consists of a crucible which is surrounded by a water-cooled coil of flattened copper tubing wound on edge. This tubing is insulated from the crucible. Incoming current to the 60-kw. motor-generator set is three-phase, 60 cycles and 220 volts. Outgoing current is single-phase, 960 cycles and 900 volts. With this equipment are installed 18 condensers,

six of which are controlled automatically by a relay device which was furnished by the Leeds & Northrup Co., Philadelphia. These condensers are necessary for power factor correction.

Ferroalloys and fluxes are kept in steel drawers near the induction furnace and bulky materials, such as scrap, are stored nearby in steel bins. Two monorail chain hoists extend the full length of the physical laboratory.

Heat-treating equipment consists of an automatically controlled gas-fired furnace and two Leeds & Northrup Co. hump-type furnaces.

The basement of this building is used for the storage of surplus supplies and spare parts. The dark room, used for developing photographic plates, is also located there.

This research laboratory is equipped, therefore, for the production of experimental steels and alloys. Their heat treatment can be followed up under exacting conditions. After production and heat treatment, the properties of these alloys can be examined chemically, microscopically and physically.

Producing Large Die-Castings for Instrument Cases

For several years the Brown Instrument Co., Philadelphia, maker of indicating, recording and automatic control instruments, has almost entirely swung over to the use of aluminum die-castings for the instrument cases and cover bezels of practically all models of its instruments.

A number of the die-castings required presented difficulties. The aluminum cases now standard for continuous chart recorders, for example, are among the largest aluminum die-castings ever produced on a quantity basis. They are 15 in. high, 13 in. wide and no less than 7 in. deep.

Die-cast aluminum cases cost substantially more than cast iron cases, if the cost of the cases only is considered. There is, however, a perfection of detail assured by the process and flaws are comparatively rare. And their resistance to rusting and corrosion is a feature.

Precision work on the standard yard and inch is advocated by the American Institute of Weights and Measures, 115 Broadway, New York, so that material standard bars may be sent to London in 1932 for comparison with the imperial standard yard, at the decennial comparison then to be made.

Heat Treatment of Gray Iron

Strains May Be Relieved by Heating at Moderate Temperatures; Castings May Be Softened Without Weakening by Annealing Above the Critical

BY EDWARD E. MARBAKER, PH.D.*

WHILE considerable information exists on the heat treating of gray cast iron, it has been looked upon as a dangerous procedure, and until very recently the process was employed in very few foundries. One of the reasons for the slow progress in this field of investigation is the difficulty in obtaining satisfactory experimental results due to the fact that compared with steel, cast iron is a very complex alloy. However, notwithstanding the difficulty of the subject, a great deal of work has been done, and it has been established that the properties of gray iron castings can be profoundly affected by the use of a suitable heat treatment.

The object of this paper is to bring together the recent information with the hope that the interest of foundrymen, metallurgists and engineers may be aroused, and that further experimental and practical work will result in the improvement of cast iron. Much is being written of the effect of casting temperatures, methods of molding and rates of cooling, all of which are instrumental in producing gray cast iron of more uniform structure and superior physical properties. These variables come into play while the molten metal is cooling, while in heat treating the variables which must be controlled exist entirely in the solid state. One may be considered in a way as the reverse of the other, and it is certain that the physical laws which control the various steps in one process are equally effective in the other.

The student of the heat treatment of cast iron and its effects on the properties of the metal must be referred to the theories of the constitution of the iron-carbon alloys which are generally familiar to metallurgists. The assumption that cast iron is a steel of eutectoid composition, different from true steel in structure only because of the presence of graphite flakes, is generally followed. The basic theory which has been well substantiated in the case of steel can then be closely followed in working with cast iron, but the excess carbon is disregarded because the properties of the iron which it is desired to change by heat treatment are inherent in the constituents which are common both to steel and cast iron. The elements present in cast iron in much larger amount than in steel, such as silicon and manganese, exercise a profound influence on the properties of the metal; therefore only the fundamental ideas derived from the study of thermal effects on steel can be applied. Accordingly cast irons differing in composition require different heat treatments to bring about like effects. The time element in heat treating is as important as temperature, because the material is in the solid state and

molecular activity is necessarily reduced. Complete transformation is rarely obtained because the necessary extension of the time involves increased cost.

In actual heat treating operations two conditions may be brought about. In the first of these it is desirable only to remove strains which have been produced during the casting process, and this is carried out at relatively low temperatures. In the second case the cast iron is also softened and thus made more easily machinable. This procedure is carried out at higher temperatures.

In working out a schedule for heat treatment, especially for cast irons to be softened, the critical temperature of the particular iron (that is, the position of the thermal arrest *Ac*) should be determined. The changes in structure which it is desired to bring about take place above this point, and definite knowledge of its position eliminates the difficulties involved in the method of trial and error.

Removal of Strains in Castings

Practically no investigations on the heat treatment of cast iron were reported prior to 1915, although there had been many important contributions on the constitution of the iron-carbon alloys and on the growth of cast iron. While these investigations were not concerned with the practical results of heat treatment, they form the theoretical basis of subsequent work.

An anonymous author¹ reported in 1915 that the casting strains in small hardware parts can be relieved by heating for 8 hr. at dull redness (1100 deg. Fahr.), and then cooling very slowly, the time required being one day. These castings were softened also, "due to the precipitation of some of the combined carbon as graphite."

L. M. Sherwin² in 1917 investigated the problem quite carefully, using a series of irons of ordinary composition, except that the silicon content was low, and found that by heating at 1100 deg. Fahr. for 24 hr. and slowly cooling, the casting strains were removed and the hardness reduced slightly. The tensile strength was reduced about 5 per cent. It was also found that similar results were obtained by heating at 400 deg. Fahr. for 24 hr. and cooling slowly.

J. E. Hurst³ in 1919 studied the prolonged heat treatment of a series of commercial irons in the form of bars. The silicon content varied from 1.14 to 2.69 per cent. It was found that by heating at 1067 deg. Fahr. in a muffle furnace for periods of 72 and 150 hr. and cooling slowly, the hardness rapidly diminished with the time, and that the extent of the decomposition of the combined carbon depends upon the silicon content.

C. J. Wiltshire⁴ reported that in castings heated slowly to 700 deg. Fahr. and held at that temperature for 7 hr. and allowed to cool very slowly (20 hr. to 300 deg. Fahr.) the strains are completely eliminated.

J. T. Harper and R. S. MacPherran⁵ in 1923 found that casting strains are relieved by heating at 1150 deg. Fahr. for one hour. With longer heating the strength and hardness decrease materially.

In 1924, R. T. Rolfe⁶ made a very careful study of the following composition: total carbon 3.59, graphitic carbon 2.86, combined carbon 0.73, silicon 1.65, manganese 0.62,

sulphur 0.10, phosphorus 0.66. Bars were heated at various temperatures from 752 deg. Fahr. to 1832 deg. Fahr. for one hour and cooled slowly in hot sand. His conclusions were that casting strains can be removed successfully by heating at 1112 deg. Fahr. for one hour and cooling slowly. Tensile strength was reduced about 6.5 per cent and the hardness decreased 2.5 per cent.

J. W. Bolton,⁷ in the same year, found that strains can be removed by heating slowly to 700 to 1000 deg. Fahr. and cooling slowly in the furnace. He states that annealing to soften is practical only where strength requirements are low. He found, as did Rolfe, that annealing at 1350 deg. Fahr. weakened the casting greatly. In a later paper⁸ Bolton recommends a temperature of 700 to 800 deg. Fahr.

J. W. Donaldson⁹ carried out prolonged annealing tests at 842 deg. Fahr. and 1022 deg. Fahr. and found that the combined carbon content was decreased, with a corresponding lowering of strength and hardness. Decomposition of carbide increases with temperature or time.

F. Grotts¹⁰ in 1925 showed that the physical properties of cast iron can be radically modified by suitable heat treatment. His iron had total carbon 3.24, silicon 2.46, manganese 0.96, sulphur 0.15, phosphorus 0.514. The average transverse strength as cast was 3966 lb. and the Brinell hardness was 131. After heating at 700 deg. Fahr. and cooling slowly the transverse strength was 4366 lb. and the Brinell hardness 131. At higher temperatures the strength and hardness were much decreased. The conclusion was drawn that for removing strains quickly, it is good practice to anneal the castings at 600 deg. Fahr.; the strength and hardness are not then materially affected.

J. A. Capp¹¹ recommends that iron castings be heated from 932 to 1022 deg. Fahr. for from 4 to 10 hr., depending upon the section and weight.

In the following table is shown a recapitulation of the foregoing preheating schedules for the elimination of casting strains:

Author	Annealing Temperature, Deg. Fahr.	Time in Hours	Cooling Rate
Anonymous	1,100	8	slow (24 hr.)
Sherwin	1,100	24	slow
	400	24	slow
Hurst	1,067	72	slow
	1,067	750	slow
Wiltshire	700	7	slow
Harper and MacPherran	1,150	1	slow
Rolfe	1,100	1	slow
Bolton	700 to 1,000	..	slow
Donaldson	842 to 1,022	..	slow
Grotts	600	..	slow
Capp	932 to 1,022	4 to 10	slow
Bolton	700 to 800	..	slow

Some discrepancy exists, doubtless due to differences in analysis of the irons and the casting conditions. It is well known that the original structure has a profound influence on the success of heat treating and obviously the time may be diminished where the original structure is uniform. From these and other investigations (which will be cited later) it appears that the desired results may be obtained by heating at a high temperature for a short time or at a low temperature for a long time. This is borne out by the fact that in the "seasoning" of castings the strains are relieved at ordinary temperatures if a sufficient time is allowed. Some of the investigators unduly prolonged the time, and since the temperatures were well below the critical range (1350 deg. Fahr.) the properties of the castings were not materially changed. This is indicated by Sherwin's results, which were practically the same whether the bars were

heated at 1100 or 400 deg. Fahr. for 24 hr. Rolfe's results show that at 1100 deg. Fahr. such a long heat was unnecessary, for he accomplished in one hour all that Sherwin did in 24.

High-Temperature Annealing to Change the Structure

Cast iron may also be heat treated to make the structure more uniform, to reduce the hardness and to render it more easily machinable by reducing the combined carbon content. It is also possible to improve the strength and the resistance to impact. For such purposes the castings are heated to a temperature above the critical range—about 1350 deg. Fahr. for the commercial irons. This, it will be remembered, is the temperature at which steel containing 0.90 per cent carbon shows the all-pearlitic structure considered best for general purposes. By heating above the

Sand Cast Foundry Pig Iron. C = 3.2 to 3.5 Per Cent. X 100. Etch—5 per cent HNO₃ in alcohol. The structure is pearlitic with a small amount of cementite

critical temperature for a time depending upon the size of the casting, the structure changes to austenite; then when cooling slowly through the critical range the austenite changes to pearlite; subsequent rapid cooling traps the pearlitic structure, and thus a cast iron of superior quality is obtained.

In 1915 G. S. Evans¹² studied a series of ten commercial irons varying from light gray (almost all cementitic) to dark gray (pearlitic with excess graphite) and of Brinell hardness from 318 to 185. The silicon contents were high, varying from 2.70 to 3.81 per cent. The rate of transformation of the combined carbon into graphite was found to increase with temperature from 1300 deg. Fahr. to 1800 deg. Fahr. However, this reaction is so rapid at 1650 deg. Fahr. that in ordinary practice, where the combined carbon does not run over 0.50 per cent and with no appreciable chilling, it is simply necessary to heat to 1650 deg. Fahr. and cool immediately, either in the furnace or in the open air, to obtain the softening effect without materially affecting the strength. No change in composition or hardness was noted when annealing at 1250 deg. Fahr. or below. The change was slow at 1300 deg. Fahr., indicating that the critical range was between 1250 and 1300 deg. Fahr., the low range being due to the high silicon content. This is confirmed in malleable practice but not by the results of Potter's investigations noted later. Potter, however, worked with cast iron of lower silicon content. For instance, one of Evans' samples having the following composition: total carbon 3.28, graphitic carbon 2.70, combined carbon 0.58, silicon 2.98, manganese 0.32, sulphur 0.086, phosphorus 1.20, showed a Brinell hardness of 237 as cast. After heating at 1400 deg. Fahr. for 5 min. and cooling in the furnace to about 800 deg. Fahr. during a 3-hr. period, and then in air, this sample showed a hardness of 141, and

¹² G. S. Evans, Foundry, V. 43, p. 219-21 (1915).

the fracture was pearly. The combined carbon was completely changed to graphite.

Piwowsky¹³ in 1922 carried out annealing experiments at various temperatures and for different periods of time on a pearlitic cast iron having the following compositions: total carbon 3.18, graphitic carbon 2.49, combined carbon 0.69, silicon 2.95, manganese 0.63, sulphur 0.068, phosphorus 0.102. The *A_c* of this iron was 1490 to 1517 deg. Fahr. and the *A_r* was 1382 to 1337 deg. Fahr. When treated at temperatures below *A_r* the rate of decomposition of the pearlite was not high enough for practical purposes. Between *A_r* and *A_c* the rate is satisfactory when the silicon is sufficiently high. Rapid annealing is obtained by quickly heating to a temperature a little above *A_c*, and cooling through *A_r* at a rate less than 1 deg. per minute.

At about the same time, Schüz¹⁴ explained very clearly the changes in structure which result during heat treatment. He claimed that satisfactory annealing results from heating at 1382 to 1472 deg. Fahr. from 3 to 10 hr., depending upon the size of the casting. He also shows that an iron of the following composition: total carbon 3.56, graphitic carbon 3.06, combined carbon 0.56, silicon 2.26, manganese 0.56, sulphur 0.112, phosphorus 0.38, and of Brinell hardness 160 to 164, when annealed for 24 hr., the carbide decomposition begins at 932 deg. Fahr. and is complete at 1112 deg. Fahr.; for a six-hour period the reaction begins at 1022 deg. Fahr. and is complete at 1202 deg. Fahr.; and for a three-hour anneal the decomposition begins at 1067 deg. Fahr. and is complete at 1202 deg. Fahr. "These results are surprising," says Schüz, "since the critical temperatures are much lower than is generally accepted." He explains this by the fact that relatively little of the original carbon is combined and the graphite tends to gather together the temper carbon produced by annealing. This investigation further substantiates the theory that annealing at a high temperature for a short time has an effect equivalent to annealing at low temperatures for a long time.

J. F. Harper and R. S. MacPherran¹⁵ state that annealing to improve the machinability should be done at 1450 to 1550 deg. Fahr., followed by cooling slowly. The decrease in hardness is accompanied by a loss in strength.

A process for heat treating white or gray cast iron was patented by A. K. Schaap (U. S. Patent 1,514,070, Nov. 4, 1924), for which great softness and undiminished strength are claimed. The process is carried out by heating to a temperature slightly above the critical (1600 deg. Fahr.) in a wrought iron muffle surrounded by a gas flame and open at the top. As soon as the iron reaches the proper temperature, the muffle and its contents are removed from the furnace and allowed to cool in the open air, the casting being protected from drafts. About 15 min. are required to cool to a black heat, after which it may be cooled in the open air. The entire operation, starting with cold iron, is said to require 45 min. The time must be increased when treating heavy castings.

The following results are quoted:

	Untreated	Treated
Total carbon	3.39%	3.30%
Graphitic carbon	2.73	3.19
Combined carbon	.66	.11
Silicon	2.36	2.50
Manganese	.37	.29
Sulphur	.064	.086
Phosphorus	.736	.746
Brinell hardness	240	140
Tensile strength, lb. per sq. in.	21,750	20,070
Transverse strength	2,900	2,770

F. Grotts¹⁶ investigated the heat treating of cast iron in 1925 with the idea that castings containing hard spots and therefore difficultly machinable need not be scrapped, for by heat treating the structure may be rendered uniform throughout. Working with a cast iron of the following composition: total carbon 3.24, silicon 2.46, manganese 0.96, sulphur 0.150, phosphorus 0.514, which had a transverse strength of 3970 lb. and a Brinell hardness of 131, he found that by heating to 1200 deg. Fahr. the hardness was reduced to 92 and the transverse to 3630 lb. By heating to 1400 deg. Fahr. (above the critical) the hardness was further reduced to 90 and the strength increased to 3790 lb. Thus he is justified in concluding that heat treatment can be used

Cast Iron Annealed at 1380 Deg. F. (750 Deg. C.) for 15 Min. and Furnace Cooled. X 100. Etch—5 per cent *HNO₃* in alcohol. Structure shows cementite (white), pearlite (dark) and graphite (black)

to soften the iron without greatly weakening it. For certain classes of work he advises a heat treatment at 1750 deg. Fahr. for a short time, then machining, and finally heating, quenching and drawing to the desired hardness. This latter procedure is not unlike that of Knowlton,¹⁷ which is used primarily for hardening castings. In Knowlton's process, the casting is case-hardened by carburization, and is then reheated to 1700 deg. Fahr. for 3 hr., cooled to 1500 deg. Fahr. slowly, and then water quenched. It is claimed that some samples so treated were considerably stiffer than malleable castings and possessed a toughness comparable with that of case-hardened low carbon steel.

O. W. Potter¹⁸ finds the best combination of properties after heating at 1600 deg. Fahr. for 3 hr., cooling to black in 15 min. and then to room temperature in air. This is much like the Schaap process, the difference being that Potter held the metal at the annealing temperature for 3 hr. while Schaap proceeds to cool immediately after that temperature is reached. Potter obtained, as did Schaap, a uniformly soft casting with only a slight reduction in strength. In a more recent paper based on further experimental work, Potter¹⁹ restates his conclusions, but in his heat treating schedule the time for holding at the annealing temperature is reduced to 2 hr.

J. W. Bolton²⁰ summed the matter up very recently in a general way by stating (and in this he follows Piwowsky) that castings should be heated at a temperature somewhat above the critical temperature and then cooled slowly, at least in the temperature range between *A_c* and *A_r*. The time necessary is less the higher the temperature and the smaller the casting. Small castings can be completely an-

nealed in a few minutes at 1600 deg. Fahr. The metal becomes softer, more malleable, and weaker.

G. C. Priester and F. J. Curran²¹ worked with a number of cast irons of usual composition at temperatures from 1460 to 1650 deg. Fahr. for varying times. They sum up their work by advising the heating of the casting at a temperature above the critical and cooling slowly.

A table in which the results of the preceding investigations are recapitulated appears at right.

There is a much closer agreement among the schedules cited on the softening of cast iron to attain better machinability than with those for relieving strains. It will be noted that in general the theoretical considerations have been substantiated. The properties of cast iron can be improved in certain respects by heat treatment. The question arises as to whether iron castings of uniform structure and unstrained, even though the strength may be lower, are not superior from an engineering standpoint to ordinary untreated castings.

Conclusions

The best results in normalizing strained castings have been obtained by heating at temperatures considerably below the critical temperature for periods of time depending

²¹G. C. Priester and F. J. Curran, *Transactions, American Society for Steel Treating*, V. 11, p. 741-58 (1927).

Author	Annealing Temperature, Deg. Fahr.	Time in Hours	Cooling
Evans	1,400		3 hr. to 800 deg. Fahr.
	1,650		3 hr. to 800 deg. Fahr.
Piwowarski	1,500	5 min.	1 hr. through 1350 deg. Fahr. slow
Schüz	1,382 to 1,472	3 to 10 hr.	slow
Harper and MacPherran	1,450 to 1,550		slow to black heat
Schaap	1,600		slow
Potter	1,600	2-3	slow
Bolton	1,600	depends on size	slow
Priester and Curran	1,460 to 1,650		slow
Knowlton	1,700	3	slow to 1500 deg. Fahr. and water quench

upon the size and section of the castings, the object being to insure the heating of the castings throughout at the annealing temperature, and then cooling slowly.

In order to soften the casting and make it more easily machinable, it must be heated at a temperature above the critical point, held for a sufficient time to insure thorough heating, and then cooled slowly at least through the first 100 deg. Castings can be hardened again after machining, if desired, by reheating, quenching and drawing to the desired hardness.

Purchasing Department Eliminates Long Waits by Salesmen

BELIEVING that it might further improve its relations with the public by eliminating the long and annoying waits which salesmen are sometimes subjected to, the Oakland Motor Car Co., Pontiac, Mich., has adopted a new system, which in two months' operation has cut down the average waiting time for each caller to less than four minutes.

Charles O. Miller, supervisor of purchases, installed the system, which operates as follows:

When a salesman calls to see someone in the purchasing department, the clerk at the information desk records the time of his arrival and the time he had to wait before seeing the person he asked for.

The system has particular application to Mr. Miller's department. Under his supervision are nine buyers whose contacts are all with salesmen. Every morning Mr. Miller sends to every member of the department the record of the

preceding day, which shows the number of contacts each man made and the length of time he kept his callers waiting. A spirit of rivalry has grown up as a result, each man vieing with the others to cut down the waiting-time average.

The best days record was an average wait of 1½ min., which the company considers remarkable in view of the fact that its callers in the purchasing department alone average from 100 to 200 a day.

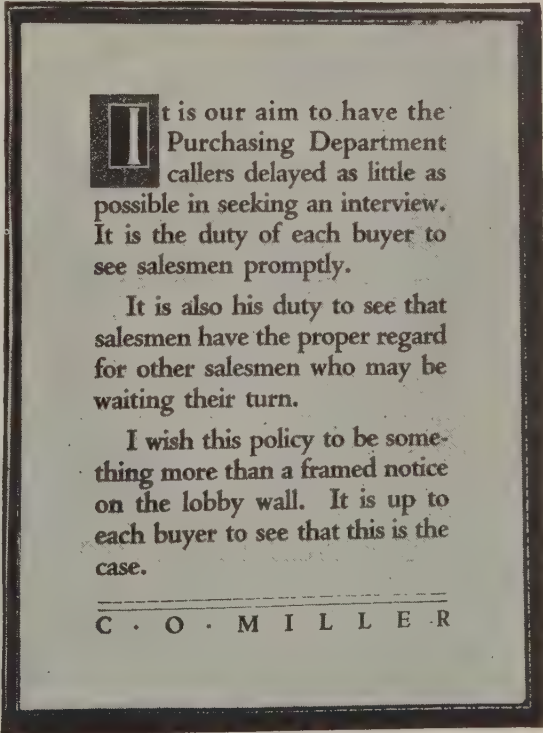

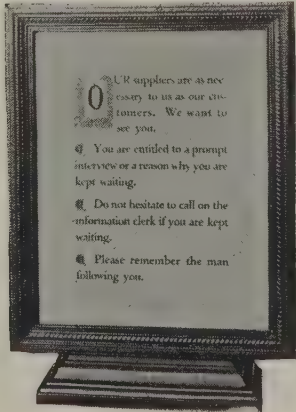

Moreover, the man who has something to sell to the Oakland company is assured of a welcome, for when he enters the lobby of the building he finds a sign which is reproduced in the center column below.

Once in a buyer's office, the salesman sees another sign, signed by Mr. Miller, and here also reproduced.

A score card is posted in the lobby daily showing the previous day's record.

These Signs in the Purchasing Department and Lobby of Oakland Motor Car Co.'s Plant Explain the Company's Aim to Interview Salesmen Promptly

Machines Large Structural Members

Special Equipment Consisting of Two Floor Boring, Drilling and Milling Units Used to Finish Ends of Columns and Other Sections

UNUSUAL accuracy and speed in finishing the abutting ends of large built-up structural members for tower and bridge sections are claimed

intermediate support is also provided in the form of a four-wheel truck to take care of any sag which might occur in the member being machined.

The milling units, of standard Sellers type, have the driving motor mounted directly on the head and all controls within easy reach of the oper-

ator when standing on the platform. The machines are also equipped with a wide range of boring and drilling speeds and feeds so that holes in the ends of the structural sections may be machined at the same setting of the work as for milling. Horizontal and vertical milling feeds are independent in direction and amount so that by combination the feed can be obtained in any direction. With this arrangement it is possible to turn corners or change direction without throwing out the milling feed, thereby eliminating interruption of the feed with its resultant mark in the work.

Special Equipment for Finishing Abutting Ends of Large Structural Members. The view above shows the general arrangement of the two units making up the machine, as well as of the longitudinal bed. The rotary unit, shown in the foreground, can be swiveled by power to an angle of 45 deg. in either direction. The intermediate work-support stands are located between the work tables of the machines, making up the complete equipment

for special floor boring, drilling and milling machines built recently by William Sellers & Co., Philadelphia, for the McClintic-Marshall Construction Co., Pottstown, Pa. The equipment was designed to mill the ends of columns and other sections 20 in. by 12 in. by 60 ft. long.

Arrangement of the machine may be noted from the illustrations. It is made up of two milling units mounted on a bed 80 ft. long, each unit consisting of a floor boring, drilling and milling machine. One unit is mounted on a rotary base at one end of the long bed and can be swiveled by power to an angle of 45 deg. in either direction so that the structural members may be finished on an angle as well as square. The second unit is mounted on a sub-base which may be adjusted longitudinally by power on the 80-ft. bed. This unit can be set to the required distance from the unit on the rotary base to finish both ends of sections, of any desired length up to maximum, at one setting. Each milling unit carries with it a slotted work-table for supporting and fastening the structural sections. An in-

Machine for Driving Web Rivets in Chassis Side Bars

THE Hanna Engineering Works, 1765 Elston Avenue, Chicago, has developed the riveter illustrated, which is particularly adapted for driving the web rivets in the side bars of automobile chassis frames.

In this machine the stake that supports the stationary die and that en-

ters the interior of the chassis frame is rotatable upon its vertical axis and is locked or indexed in two positions of rotation 180 deg. apart. The upper portion of the stake adjacent to the die mountings is offset or "goose necked." By indexing the stake the offset is thrown to the right or to the

The Combination of an Indexed Rotary Stake and Radially Rolling Base Permits the Machine to Drive a Diversity of Web Rivets. Pressure of 30 tons at 100-lb. air pressure is exerted at the dies

left as desired. An advantage of this arrangement is that the stationary die may be centered upon a rivet which joins a channel-shaped cross member to the side bar channel web, whether the flange legs at top and bottom of cross member extend toward the front or toward the rear of the chassis frame. The stake has double die mountings on one axis so that one die or the other is in position to oppose the live die regardless of stake indexing. This feature permits one riveter to enter upon rivets that would otherwise require two riveters.

The machine is mounted upon a radially rolling base which permits swinging it from the operating position on one side of a suspended chassis frame to the operating position on the other side of the frame. Trans-

verse and rotary movement are accomplished rapidly. It is claimed that because of the combination of an indexed rotary stake and radially rolling base one of these machines will drive as great a diversity of web rivets as four chassis frame riveters without these features. It is also stated that the machine is particularly adapted for truck and pleasure car frames of comparatively low daily production which require that each riveter drive a large number of distinct rivets in each frame.

The machine shown exerts 30 tons on the dies at 100 lb. air pressure and will drive rivets as large as $\frac{3}{4}$ in. in diameter hot and $\frac{7}{16}$ in. in diameter cold. It is also available in 20-ton and 15-ton capacities.

that stud. The ratchet shown contains 16 teeth and is operated by means of an indexing mechanism, including the rod *H* which extends into the machine. This rod carries a yoke on which a cam roll is mounted, and is operated by means of a cam on the main shaft of the machine.

Reciprocating motion is given to the rod through the cam roll. The rod is secured to the crank, mounted adjacent to the index ratchet, and thus oscillates that crank, causing the index pawl to engage the teeth of the ratchet. The lever secured in the pawl is intended for releasing the index ratchet in case the movement of the dial and the ratchet is impeded. In this event the dial can be turned in a direction opposite to the usual indexing motion and the obstructing piece can be removed.

Another detail view is an enlargement of the dial. This is machined so that the openings on the periphery fit the parts to be drilled and tapped. The openings are slightly oversize, to allow for variations in the castings or blanks. The relation of the holes drilled and tapped in these parts is controlled by a bushing carried by the arm *J* mounted on the sleeve, which slides on the stud and moves with the drilling spindles. The spring in contact with this arm tends to press the sleeve toward the dial and the work in it.

Fastened to the main body of the dial is the hardened plate *K*, with a

Horizontal Drilling and Tapping Machine

A NEW machine for drilling and tapping horizontally has been brought out by the Anderson Die Machine Co., Bridgeport. All the operating elements are similar to those in the company's standard No. 40 machine, except that the tapping spindles, as well as the drilling spindles and the axis of the dial, are in horizontal planes.

Where the hole to be drilled is of considerable depth and the material is stringy, the company's experience indicates that the horizontal machine is particularly well adapted. This is principally because the chips on such a design will drop free from the dial.

In the general view of the machine, which was taken from the end on which is located the segment operating the tapping spindles, *A* is the dial mounted in a housing, *B* is the segment operating the tapping spindles, and *C* shows the upper portion of the

spindle slide. The motor at *D* actuates the drilling spindles, while the main motor for operating the machine, as well as the tapping spindles, is located at *E*.

One detail shows the indexing mechanism, including the ratchet, the guard having been raised. In this view, *F* is the knee or slide on which the dial pan or housing is mounted. It carries the journal for the stud on which the dial operates. *G* is the index ratchet mounted on the end of

General Appearance of the Machine Is Supplemented by Two Details with Operating Units as Described in the Text

series of openings *LL* which fit the the lower end of the bushing on the arm *J*. The holes in the plate *K* correspond to the openings in the dial plate and are located to act as a jig.

As the spindle slide *M* approaches the dial and the work, the lower end of the bushing enters one of the openings *L* before the drill comes into contact with the work. This bushing exerts a pressure on the work so as to hold it more or less rigidly during the operation of drilling.

The particular dial illustrated has 32 openings. Hence, the index ratchet of 16 teeth presents two parts to be drilled and tapped for each stroke of the machine. On work of this nature the machine can operate at a speed of approximately 30 strokes a minute. This gives a theoretical production of 60 pieces a minute.

Parts, fed into the dial by hand, are generally malleable iron castings, subject to a certain variation in diameter or size. It sometimes happens

that a piece will not go into the dial to its proper depth. To prevent such defective parts being fed through to the drilling and tapping spindles, a rigid stop *P* is secured adjacent to the dial. This acts as a gage; if the part is not in position, it will lock the dial and prevent feeding. Preceding the stop is a spring *Q* which helps press a part into its proper place.

If a part thus impedes the rotation of the dial, the latter will be stopped in a position where the pilot pin *R* will prevent the drilling and tapping spindles from coming in contact with the dial. This prevents injury not only to the dial, but to the spindles. To clear the dial so as to permit further indexing, the lever projecting through the guard permits the operator to lift the index pawl out of the path of the index ratchet. This allows the dial to be rotated backward far enough so that the part which acted as an impediment may be removed.

Combination Horizontal Boring, Drilling and Milling Machine

FOR use in structural and other metal-working shops, the work in which includes the machining of both small and large bulky pieces, Joseph T. Ryerson & Son, Inc., Sixteenth and Rockwell Streets, Chicago, is offering the combination floor and table type horizontal boring, drilling and milling machine here illustrated.

The machine shown was built for the Canadian Bridge Co., Walkersville, Ontario, Canada. It is a standard floor type horizontal boring and milling unit having a spindle saddle which is free to move vertically on the face of the column; a column with horizontal movement on its runway; a bed plate fastened to the runway; and an outer boring bar support which has hand movement on the bed plate parallel to the spindle travel. The

machine is arranged for direct motor drive and all speeds and feeds and power traverse to the spindle, spindle head and column are controlled from the head. The outer boring bar support, as well as the main post, is fitted with vernier and scales which read to 0.001 in.

A special self-contained portable table, for use when machining small pieces, and which may be removed when the machine is wanted for larger work, is mounted on the bed plate. This table has movement in two directions, parallel with the spindle travel and parallel with the column travel. It is operated by hand, but the arrangement is such that an electric motor can be applied to provide table milling feeds and rapid traverse.

The Machine Combines Floor and Table Type Boring, Drilling and Milling Units. It was designed for use in machining both small and large pieces

Blowpipe Weighs 14 Ounces

THE Air Reduction Sales Co. has placed into production blowpipes known as style 8800 and style 8900, the latter of which is illustrated. The tips are made of seamless copper tubing, tapered and bent to an angle of $67\frac{1}{2}$ deg. Any one of these may be screwed into the mixer head, and this joint is so far from the heat of

Style 8900 Airco Welding Torch and Extra Tips

the flame that maintenance of a correct gas-tight joint is found to present no difficulty. Two mixing heads are provided, one for the smaller flames necessary for sheet metal, and the other to produce larger flames for steel plate.

Style 8800 is designed on similar lines, but is intended for general use where the heaviest sections may have to be welded. With No. 5 tip, the length is 17 in. and the weight 29 oz. Style 8900 with No. 1 tip is 14 in. long and weighs only 14 oz. The latter is equipped with light-weight hose and 3/16-in. connections.

Indianapolis Steel Treaters Elect Officers

A most successful year has been concluded by the Indianapolis Chapter, American Society for Steel Treating. At the annual frolic, held this year at Idelwood Park, the following officers for 1928-29 were elected:

Chairman: Edward J. P. Fisher, research metallurgist, Diamond Chain Mfg. Co.

Vice-Chairman: Carl J. Winkler, general superintendent, Schwitzer-Cummings Co.

Secretary: Nelson R. Gorsuch, industrial engineer, Citizens Gas Co.

Treasurer: Richard S. Smith, assistant director of research department, E. C. Atkins Co.

Foundrymen's 1929 Meeting in Chicago

Non-Operating, Limited Space Exhibition to Be Held in Hotel—Apprentice Contest Awards Announced

THE American Foundrymen's Association will hold its 1929 convention and exhibit at the Hotel Stevens, Chicago, the week of April 8. This was decided at a meeting of the board of directors held recently in Chicago. The exhibition hall of the Hotel Stevens will be utilized for exhibits and because of the limited space the size of booths will be restricted and there will be no exhibits in operation. Consideration was given to several plans, but there was unanimous adoption of the idea of limiting the scope of the exhibition next year. A larger exposition with operating exhibits will be held in 1930.

At its meeting the board of directors received the reports of judges of apprentice molding and pattern making contests and the awarding of certificates was authorized.

Winners of the pattern making contest were:

1. Frank F. Cuzzzone, General Electric Co., Schenectady, N. Y.
2. Arnold H. Behrens, Milwaukee Pattern & Mfg. Co., Milwaukee.
3. John Albert Anderson, John Deere Harvester Works, East Moline, Ill.

Winners of the gray iron molding contest were:

1. Peter G. Bathgate, Brown & Sharpe Mfg. Co., Providence, R. I.
2. George A. Shuster, Jr., Olney Foundry Co., Philadelphia.
3. Attilio Rocchi, Cresson-Morris Co., Philadelphia.

Only one prize was awarded in the steel molding contest because the castings submitted from Milwaukee were lost in transit and the second and third prizes will be announced later. Alex. Cooke, General Electric Co., Schenectady, N. Y., was winner of the first prize.

A resolution was adopted by the board of directors that the American Foundrymen's Association petition the United States Government to include in its biennial census of manufactures statistics on the number of young men being trained in various industries by formal or indentured apprenticeship, together with the proportion which this number bears to the number of skilled mechanics in each industry. The resolution commented on the fact that the training of young men for the foundry industry and for industry in general is handicapped by such lack of information.

Research Policy

The board authorized the appointment of a committee of five representing various branches of the industry to determine policies of the American Foundrymen's Association regarding research work and appropriations for that purpose. It referred to a committee of three the report of the committee on gray iron castings which recommended a program of joint research in cast iron,

the American Foundrymen's Association to cooperate with the Engineering Foundation, the Gray Iron Institute and others.

Uniform cost systems adopted by the Steel Founders' Society of America and the Malleable Iron Research Institute were recommended to all steel and malleable foundries, and the board decided to encourage the Gray Iron Institute to develop a uniform cost system for gray iron foundries. The organization of a representative group of non-ferrous foundries to develop a uniform cost system was also recommended.

Action on Standards

The recommendations of the joint committee on molding sand research that two tentative procedures for testing sand be advanced to standard, that two new tentative procedures be established and that some minor changes be made in the wording of others to clarify the text were approved. The printing of a new pamphlet showing standard and tentative methods of tests for molding sand was authorized.

Covel-Hanchett Co. Buys Badger Tool Co.

The Covel-Hanchett Co., Big Rapids, Mich., has purchased the Badger Tool Co., Beloit, Wis., manufacturer of heavy-type disk grinding machines. All of the equipment of the Badger company at Beloit will be moved to Big Rapids, Mich., and the Badger line will be manufactured in the Hanchett plant at that place.

A few months ago the Covel-Hanchett Co. bought the Wilmarth & Morman Co. plant at Grand Rapids, Mich., and now, with the addition of the Badger line, it will manufacture an almost complete line of grinding machinery, excepting internal and roll grinding machinery.

Simplification for Woven Wire Fencing

The Division of Simplified Practice, United States Department of Commerce, announces that simplified practice recommendation No. 9 on woven wire fencing, which was recently revised by the industry, is in effect as of July 1, subject to annual revision. The original recommendation, as adopted by the industry, reduced the variety of woven wire fencing from 552 to 69, and woven wire fence packages from 2072 to 138. The revised recommendation further reduced this to 62 and 117, respectively.

The board also approved the tentative standard malleable foundry refractories' shapes and sizes adopted by the joint committee on foundry refractories and passed upon favorably by the Division of Simplified Practice, United States Department of Commerce. The board authorized the appointment of a committee to consider the advisability of sponsoring a joint committee to draft uniform trade customs for the castings industry.

Resolutions were adopted in appreciation of the work done for the association by the retiring president, Stuart Wells Utley, and by two retiring directors, Jesse L. Jones and Herbert S. Simpson. The new board of directors was organized with the new president, S. T. Johnston of the S. Obermayer Co., Chicago, in the chair. C. E. Hoyt was reelected secretary-treasurer and manager of exhibits and R. E. Kennedy was reelected technical secretary. S. W. Utley, A. B. Root, Jr., S. C. Vessy and A. E. Hageboeck, who are directors, were elected members of the executive committee to serve with the president, vice-president and executive secretary. The resignation of W. D. Goldsmith as a director was accepted, the vacancy being filled by the election of H. Cole Estep, Penton Publishing Co., Cleveland.

New Plant for Preparing Foundry Sand

George F. Pettinos, 1206 Locust Street, Philadelphia, has recently put into operation a new plant near Millville, N. J., for the screening and washing of molding and core sand. The product, which is to be known as "Foundry Flints," is being marketed with emphasis on the smooth roundness of the flints and the care with which they are prepared. With grain sizes which, it is stated, are properly proportioned, a given amount of oil will go much further in making cores than would be the case with sand of irregular shape.

Inland Steel Buys Additional Land

The Inland Steel Co., Chicago, has bought a tract of 128.6 acres adjoining the Indiana Harbor, Ind., plant of the Youngstown Sheet & Tube Co. The land is the last unoccupied section in the vicinity of the Indiana Harbor plant of the Inland Steel Co. and was bought to provide room for future development. There are no immediate plans for the improvement of the property. The land was bought from Princeton and Harvard universities and the Massachusetts Institute of Technology, joint beneficiaries in the will of the late Henry C. Frick, former owner. The consideration was \$543,000.

Business Analysis and Forecast

Favorable Trade Conditions Are Strong

Business Still Following Downward Path Predicted by
P-V Line—No Serious Recession Likely

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

THAT demand and supply conditions are temporarily in balance may be indicated by the fact that the P-V line remained unchanged last month. Accordingly, commodity prices also were little changed, though such trend as has appeared has been downward. Business on the whole receded in June and in early July, as is clearly reflected in volume of freight tonnage, imports and steel production. Nevertheless, stocks of manufactured commodities in producers' hands are rather large in a number of industries. Industry in general is very spotty. A number of leading companies in the more active industries have been able to do very well, and report better earnings for the second quarter, but narrow

margins of profit are hurting the rank and file in many lines and reports of severe competition and numerous failures show that the average condition is but fair.

On the whole, the favorable conditions, aside from money and credit, are strong, and preliminary estimates indicate that the crop prospects are reassuring, except in the case of spring wheat. With demand in the key industries (building, automobiles, steel) good and the leading companies in a very strong financial position, business prospects for the fall are fair. Probably a little further recession in business activity will occur, but it will not be much more than seasonal and is likely to be followed by a period of irregular stability.

The year-end prospects, however, continue uncertain.

THREE chief problems, or questions, bearing on the business outlook, are found in bank credit, crops and the position of certain backward industries. If developments in these respects are satisfactory, the business situation will continue good; otherwise a downward trend may be expected.

As to the position of bank credit and money, no material change has occurred recently. Bank reserve ratios are relatively low in comparison with those of recent years, the Federal Reserve ratio being about 69 per cent in comparison with 79 a year ago. Loans and discounts are high in com-

Factors in the General Business Outlook

Favorable Factors

- (1) *Building activity continued its upward trend in June*
- (2) *Automobile production, though declining, is in large volume, considering the season*
- (3) *Retail trade volume is fairly large and continued to gain in June*
- (4) *Crop prospects good*
- (5) *Merchandise exports gained in June, considering the season*
- (6) *Unfilled steel orders increased*
- (7) *Strong financial position of most leading companies*
- (8) *Light mercantile inventories*

Unfavorable Factors

- (1) *Bank credit moderately strained and money rather tight*
- (2) *Declining commodity prices*
- (3) *Railroad freight traffic and revenue lower in June, with little improvement since then*
- (4) *A considerable number of industries are in an unfavorable position (textiles, rubber, paper, sugar, coal and pig iron; excess supply of crude and fuel oil)*
- (5) *Severe competition and narrow profit margins*
- (6) *Business failures numerous*
- (7) *Factory labor employment 4 per cent under a year ago*
- (8) *Political uncertainties*

DOWNWARD
Movement of the P-V Line (Ratio of Commodity Prices to Physical Volume of Trade) Has Stopped. Steel Production (adjusted) after rising for five months has moved downward for two months

UNFILLED
Orders Have Again Turned Upward; Stock Prices, Though at a High Level, Are Irregular and Scrap Prices Are Weak. The two latter indexes point to lower operating conditions

BOTH Building Activity and Automobile Output Showed Great Strength in June. They are higher than at the same season in any of the past five years

RETAIL Trade Continues to Show Improved Buying Sentiment. Wholesale business remains slow, while industrial production is well in line with retail sales

parison with net demand deposits, running 119 per cent, against 109 per cent last year at this time. Brokers' loans in particular are out of line, the figure at this writing being \$4,184,000,000, against \$3,141,000,000 last year. The member banks are heavily in debt at the Reserve Banks, bills rediscounted amounting to well over \$1,000,000,000, in comparison with only \$398,000,000 at this time in 1927.

Money rates are above normal and tending to become higher. All this has been brought to a head by heavy gold exports during recent months, though the present situation has been forced by an over-extension of credit for speculation in stocks and in real estate. No relief is probable until there has been a large amount of liquidation in brokers' loans, which will allow a reduction in bills rediscounted. This situation at present is unfavorable, not only as to the outlook for investment securities, but also for business since *high money rates tend to check building operations and the purchase of equipment, to say nothing of their general effect on the cost of working capital and on financing of installment sales.*

The crop outlook is fairly good, and is reassuring as to the probability of any trouble developing in the farm situation. Some unfavorable aspects appear in the wheat crop, as spring wheat in the Northwest has shown up rather poorly, while the large Canadian wheat crop that is promised, together with the accumulation of winter wheat in the Southwest, threatens lower prices. But most of the other crops promise to be average or above average, and farm prices average so much above a year ago that the gross income of the farmers will probably be larger. Hogs are higher, the excess production being remedied, and afford a better market for the corn crop, volume of the latter being estimated at somewhat below last year's crop and the five-year average. Fruit crops in general are good and notably so on the Pacific Coast.

As to the sore spots among the industries, they continue sore—textiles, coal, paper, rubber, oil. No signs of sustained material improvement have appeared. Conditions in such industries must act as a drag on the progress of all industries taken together. The troubles of these backward industries, however, are not acute, but are a rather chronic condition to which we have become more or less adjusted during recent years.

Clearly the most threatening aspect of the business situation is to be found in money and credit.

Declining Steel Production Follows P-V Line

IF we make due allowance for the usual seasonal variations, the output of steel ingots in June declined for the second month in succession. This appears to be in response to the preceding action of the P-V line,

which barometer reached its peak in January. In June, however, the P-V line ceased to decline and its action indicates a temporarily stabilized position, with the general industrial output about in balance with the nation's demand at the present level of prices. The further trend of this barometer seems doubtful. It is determined by the ratio between commodity prices and the physical volume of trade, and, as the trend of prices seems to be slightly downward, any increase in physical volume (allowing for seasonal variation) would bring renewed decline.

Until the P-V line actually turns upward, we will consider the underlying tendency both in general business and in steel production to be downward and any increase in the monthly indexes to be temporary. Present indications suggest a fairly stable rate of steel production, with any change probably in the nature of a moderate and gradual recession.

Construction and Automobile Output Rounding Off

DURING recent months the steel industry and industry in general have been strongly supported by the activity in the building and automobile industry. It is, therefore, of much interest to note the trends established by the final June figures for these two key industries, and the more so because the two usually run together. We are again impressed with the appearance of "rounding off" in the two curves shown in the second chart.

Automobile production in the United States and Canada in June amounted to 425,100 cars and trucks, or 16,500 a day. This compares with 460,000 in May, or 17,690 a day. The decline is greater than usual for the season and our adjusted index, as shown in the chart, is 122.2 against 123.6 in the preceding month (the average for 1921-1927 is equal to 100). The June figure is record-breaking for that month, but it represents a real decline from May, and on the seasonally adjusted basis is exceeded by as many as ten months in the years 1925 and 1926. The automobile business has seen its seasonal peak for the year and will probably decline steadily during the remainder of 1928, though whether the decline will be much more than usual for the season remains uncertain.

Building activity fell off in June, but the decline was a little less than usually occurs in that month, and our adjusted index rose slightly, being 130.6 in comparison with 128.7 in May. This increase in the adjusted index is smaller than the increase of May over April, so that the rise in the building production curve has tapered off. Moreover, July weekly figures appear to indicate a decided decrease and are running behind a year ago, when building activity was relatively low. It should be remembered that the increase in vacancies

reported, on the one hand, and the high cost of money, on the other, are tending to curtail speculative building operations in cities, which operations have been an important factor in the last few months. In a word, in June these key industries, while fully normal in activity and furnishing strong support for the steel industry, showed indications of passing their peak and rounding off for a decline.

Industrial Output and Trade Hold Up Well

THE situation revealed in the third chart, dealing with production and trade, is not unfavorable. The total value of the industrial output in June, based on the Federal Reserve Board's index of production and Bradstreet's price index, was considerably above the average for 1919-1926, though below the level of retail sales. The trend of industrial production values was downward in May and June, and we know that freight traffic fell off and commodity prices were lower. This is as forecast by the P-V line.

Retail trade reached a new peak in June, judged by old standards, but the continued addition of new stores to the growing mail order and chain organizations has deprived our old indexes of much of their value. Even department store sales taken alone, however, were higher with reference to the average for 1919-1926 than the curve of industrial production values. Wholesale trade decreased in June and continues relatively low.

Little to Be Hoped for in Stock Market

OUR unfilled steel orders barometer has turned sharply upward, due to the change from a condition of decline to one of increase. As noted in a previous review, the circumstances make such a sharp rise unconvincing and judgment as to its significance should be suspended. Prices of heavy melting steel scrap at Pittsburgh declined in June, the average for the month being \$14.45 against \$15.25 in May. The July average will show a further decline, the figure for the first three weeks being \$14.08 and the latest price being \$14.25.

Although there has been a little response recently to the increase in the unfilled orders, the average price of a representative group of steel stocks fell sharply in June, the figure for that month being 150.5 in comparison with 160.7 in the preceding month, a drop of 6.3 per cent. At this writing steel stocks are showing a little strength, but the average for the first three weeks of July is only 148.1—a further small decline. In view of the money situation, no sustained recovery seems probable, and steel stocks are likely to suffer as a result of the apparent necessity for further general liquidation in securities.

June Continues Large Exports

Half-Year 20 Per Cent Ahead of 1927—Imports

Less in June, but Half-Year

Was 1½ Per Cent Up

WASHINGTON, July 27.—Maintaining their high rate, exports of iron and steel products from the United States in June aggregated 262,052 gross tons, which was only 5738 tons under the total of 267,890 tons exported in May, the largest monthly amount since February, 1921, when the volume was 393,328 tons. For the six months ended with June, exports amounted to 1,358,742 tons, or 225,315 tons over the total of 1,133,427 tons for the corresponding period of last year, an increase of a little less than 20 per cent. The reduction of 20 per cent in freight rates on iron and steel for exportation, effective Jan. 1, 1928, is assigned as one leading reason for the rising trend of exports. It is understood that this reduction, made "experimental" for one year, will be continued by the carriers, provided iron and steel exports

show an increase of 20 per cent, and that amount of gain has been almost reached so far this year.

Imports of iron and steel in June declined to 65,819 tons, a drop of 6287 tons under the 72,106 tons exported in May. For the six months ended with June, however, a slight increase, amounting to 6511 tons, was made over the corresponding period of last year, the respective totals being 389,895 tons and 383,384 tons.

Based on daily movement, exports in the 30 days of June were at a higher rate than in the 31 days of May, the June shipments averaging 8735 tons as against 8642 tons in May.

One of the important factors swelling the June shipments was scrap, exports of which amounted to 64,918 tons, against 59,417 tons in May, both being large quantities for this prod-

uct. Japan is said to be a controlling market in exports of scrap, and evidently is importing large quantities by reason of a shortage of pig iron. Exports to Japan, amounting to 18,551 tons, were greater than those to any other country in June. Canada ranked second, taking 13,797 tons. Italy took 12,622 tons; Poland and Danzig, 8990 tons, and Germany, 8713 tons. For the six months ended with June, exports of scrap totaled 250,455 tons, against 104,710 tons for the corresponding period of 1927.

Next to scrap, the largest item of exportation in June was tin plate, with a total of 22,276 tons, of which Canada took 5558 tons; Japan, 3195 tons; China, 2945 tons; Argentina, 2456 tons, and Mexico, 1179 tons. For the six months ended with June, exports of tin plate totaled 125,099 tons, against 152,767 tons for the first

half of 1927. Of the six months' total for the present year, Japan took 26,683 tons, against 29,998 tons, while Canada took 23,387 tons, compared with 24,950 tons for the corresponding period of last year. Tin plate exports in May were 22,462 tons.

Exports of plain structural material in June totaled 19,356 tons, of which Canada took 17,377 tons. For the six months ended with June, exports of this material aggregated 89,873 tons, against 66,222 tons during the corresponding period last year. In May, exports of structural material were 18,498 tons. For the first half of the current year Canada took 75,492 tons, against 53,905 tons for the first six months of 1927.

Black steel sheets to the quantity of 19,223 tons were exported in June, of which 9767 tons went to Canada and 7207 tons went to Japan. For the first six months of 1928, exports of black sheets amounted to 90,311 tons, against 90,229 tons for the corresponding period of last year. Canada was the destination of 40,500 tons of this product during the first half of the present year, against 39,223 tons for the corresponding period of last year. Exports to Japan were 37,430 tons and 37,551 tons, respectively.

Of the 14,529 tons of plates exported in June, 12,202 tons went to Canada. For the first six months exports of plates were 71,726 tons, of which Canada took 60,534 tons. For the corresponding period of last year this class of exports totaled 70,352 tons, of which Canada took 55,991 tons.

Exports of boiler tubes and welded pipe in June totaled 21,281 tons, of which 9456 tons was casing and oil line pipe, 6905 tons was black welded pipe, and 3519 tons was galvanized pipe. These shipments were distributed to markets all over the world where there are oil operations.

Of the casing and oil exports in June, 2804 tons went to Venezuela, 1422 tons to Argentina, 672 tons to Canada, 630 tons to Mexico and 524 tons to Rumania. Japan took 1749 tons of black welded pipe; Canada, 898 tons; the United Kingdom, 673

tons, and Argentina, 479 tons. Galvanized pipe exports were distributed in small lots, the Dominican Republic taking the largest single quantity, amounting to 487 tons.

North and Central America and the West Indies took 124,397 tons of the June exports and 650,589 tons during the first half of the current year, against 558,960 tons for the corresponding period of last year. Canada and Newfoundland alone took 100,855 tons in June and 535,178 tons during the first six months of 1928, against 433,264 tons during the corresponding period of 1927. South America took 35,452 tons in June and 219,525 tons during the first six months of the present year, against 186,714 tons during the first six months of last year, Argentina leading.

Europe took 41,928 tons in June and 149,734 tons during the first half, against 90,664 tons during the corresponding period of last year. The Far East took 58,731 tons in June and 330,989 tons during the first six months, against 286,613 tons during the first six months of 1927. Japan took 40,387 tons in June, 181,572 tons during the first six months of the present year and 148,402 tons during the first six months of last year, and was (next to Canada) the largest consumer of steel products from the United States during all three periods.

The decrease in imports in June was due largely to the drop in incoming shipments of cast iron pipe when compared with May, the totals being

2525 tons and 9150 tons, respectively. Of the June imports of cast iron pipe, 1798 tons came from France and 450 tons from Germany. Pig iron imports rose to 11,799 tons in June, against 9732 tons in May. For the first six months they were 75,295 tons, against 60,319 tons for the corresponding period of last year. Of the June imports, 6726 tons came from the United Kingdom; for the first six months, imports from that country were 34,727 tons. British India supplied 3792 tons in June and 23,780 tons during the six months' period.

Of the 14,438 tons of structural shapes imported in June, 7287 tons came from Belgium, 4363 tons from France and 2585 tons from Germany. Of the 5742 tons of steel bars imported in June, 2574 tons came from Belgium, 1355 tons from Sweden and 1081 tons from France. Ferromanganese imports in June amounted to 5870 tons, of which 3256 tons came from Canada, 1357 tons from the United Kingdom and 1127 tons from Norway.

Soviet Russia supplied 4120 tons of the 12,650 tons of manganese ore concentrates imported in June, while 3131 tons came from Brazil, 3009 tons came from India and 2282 tons from British West Africa.

Belgium, with 13,555 tons, was the largest source of imports in June. The United Kingdom ranked second, with 11,623 tons, while Canada was third, with 10,524 tons. Germany and France supplied 9705 tons and 9150 tons, respectively.

Shrinkage in Imports of Iron Ore

IMPORTS of iron ore into the United States in June are reported by the Department of Commerce at 188,892 gross tons, compared with 211,270 tons in May. The June imports are the smallest since March and compare with 231,815 tons a year ago. For the first half-year the total was 1,268,413 tons, a reduction of about 1 per cent from last year's 1,280,756 tons.

Chile, with more than half the total, maintained its lead as a source of supply. French Africa in the six months has taken second place, which was held by Cuba last year. There was a gain of about 10 per cent in receipts from French Africa and a reduction of nearly 64,000 tons in the Cuban ore. Sweden sent 70,000 tons less than a year ago, no ore coming

from that country during June. On the other hand, Canada gained about 37,500 tons in the first half year, compared with 1927.

Details of the June shipments and of those of the first half year are shown in the table.

Meeting of American Manganese Producers

The annual meeting of the American Manganese Producers' Association will be held at the Mayflower Hotel, Washington, Sept. 10 and 11. A review of the progress of domestic manganese developments in the past year and prospects for the future will be presented. All persons interested in the development of American manganese are expected to be present. J. Carson Adkerson is president of the association.

Little Activity in European Markets

British Bank More Furnaces—Production in Germany Is Less and Orders Fall Off—France Pushes Internal Business

(By Cable)

LONDON, ENGLAND, July 30.

NORTH-EAST COAST producers have banked three additional blast furnaces, of which two were making hematite, leaving only 29 North-East Coast furnaces, including seven on hematite, now active. The industry, generally, is depressed, though export demand is improving slightly.

Foreign ore markets are idle. The Swedish strike has entered its seventh month without any sign of terminating.

Finished steel markets, generally, are quiet. Scottish plants are reopening this week, but there is no large accumulation of orders. There is some business to be had because of a stiffer tendency in Continental steel. But export sales are negligible, except in certain specialties.

Tin plate demand is improving. There is good export inquiry for mod-

erate lines, and Welsh makers hope to obtain enough business so that the industry may work generally at over 90 per cent of capacity. The forward position is being maintained, but some makers are anxious to dispose of August tin plate orders accepted at below 18s. basis, IC, f.o.b. works port.

Galvanized sheet markets are quiet, with an easier tendency. Black sheets are dull, but rollers of Japanese thin sheets are well placed for several weeks ahead.

On the Continent of Europe

Continental steel markets are strong. Germany is reported well sold on direct export orders. Syndicate prices are advancing, sheet bars being quoted up to £5 (\$24.30) a metric ton. Demand from Britain is quiet, owing to the holiday periods.

French production of pig iron in June was 844,000 metric tons; of raw steel, 797,000 tons.

products. While French and Saar district furnaces are selling increasing quantities of pig iron to consumers in South Germany, reports of large tonnages of British iron sold to this district are said to be somewhat exaggerated.

June output of pig iron totaled 1,021,350 metric tons, compared with 1,044,046 tons in May and 1,067,583 tons in June, 1927. Total production of pig iron in the first half of the year was 6,586,380 metric tons, slightly larger than the first half of 1927 with 6,365,057 tons.

The report of the Vereinigte Stahlwerke A. G., Dusseldorf, for the second quarter of this year, which is the third quarter of the company's business year, shows a decline in production and total sales, but an increase in exports. Pig iron output declined to 1,541,871 tons compared with 1,703,105 tons in the first quarter of the year, and steel ingot production to 1,619,150 metric tons compared with 1,842,187 tons in the first quarter. During the quarter the number of employees was reduced from 182,014 to 177,000. The decline in output of pig iron by 10.5 per cent and of steel by about 14 per cent is explained in the report as seasonal. During the quarter the company blew out one furnace and blew in a new furnace at its August Thyssen Huette at Hamborn. Unfilled tonnage at the end of the second quarter was 89.4 per cent of the unfilled tonnage at the

German Output Decreases

Unfilled Tonnage of United Steel Works Smaller—Prices Continue Unchanged

BERLIN, GERMANY, July 14.—The industrial outlook has not improved and no increase in demand for iron and steel seems to be expected for the rest of this year. The total of unemployed is declining, but the reduc-

tion in the number has been much smaller than during the first half of last year. The Pig Iron Syndicate is selling iron for August delivery at unchanged prices and no change has been made in domestic prices of steel

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works, with American equivalent figured at \$4.86 per £ as follows:

beginning of the business year last October, whereas, at the beginning of this year, unfilled tonnage was 92.3 per cent of the total Oct. 1.

There has been no improvement in the engineering industries, but the monthly report of the Machine Manufacturers' Association states that business as a whole has not shown any further decline. Business in locomotives and textile machinery is quiet. Demand for agricultural machinery has increased as usual at this season and conditions in paper making and printing machinery are reported to be satisfactory.

There are renewed reports of a

merger of three large bridge construction companies, Harkort Bruck-enbau, Flender & Co. and Hein Lehmann & Co. Machine-tool tobacco machinery and textile machinery manufacturers and builders of motors, dredges and cranes are reported to have taken orders to the value of about 40,000,000 m. from the Jugoslavian Government, to be partly paid for on reparations account. It is reported from Amsterdam that all cars on Dutch railroads are to be fitted with Kunze-Knorr brakes by the end of 1929. All German railroad cars will be equipped with these brakes within the same time limit.

French Mills Seek Domestic Orders

Prices Offer More Profit Than Export—Sellers Booked for Five to Six Months

PARIS, FRANCE, July 16.—Some sizable contracts will probably be placed soon in connection with the planned improvement of ports, the second part of the naval program, railroad rolling stock requirements, electrification of railroads and the Loucheur plan for construction of low rent dwellings. A part of these orders, however, will be placed in Germany to reparations account and French industries have exhibited some uneasiness. Minister of Labor Loucheur, however, has stated that in the project for construction of low cost dwellings the portion awarded to Ger-

many on reparations account shall not exceed 20 to 25 per cent of the entire expenditure and that the price paid shall in no case exceed the price at which similar materials could be obtained in France.

Stabilization of the franc has had a favorable influence on the price situation, but export prices have shown further advances. Some increase in domestic prices is expected to result, more in finished material than in other forms, as finishing mills are in many cases quoting prices that have not been advanced with their costs. As a means to improve these prices, efforts are being made to form

"ententes," the latest of which was among the nail manufacturers.

Export prices have registered an advance of about 1s. (24c.) per ton, f.o.b. Antwerp in the past week. Merchant bars have been increased from £5 12s. (1.134c. per lb.) to £5 13s. per ton (1.35c. per lb.). Ordinary specifications of beams have been advanced from £4 16s. 3d. (1.06c. per lb.) a week ago to £4 17s. per ton (1.07c. per lb.). Plates are unchanged at £6 6s. 3d. per ton (1.21c. per lb.), f.o.b. Antwerp for ¼-in.

The efforts made recently by French pig iron producers to form a selling organization have not yet succeeded and formation is not now expected before October. French foundry consumers of hematite iron have protested against any action by the Government on the recent request of the French hematite iron producers that a reduction should be made in the quantities of foreign hematite temporarily admitted free of duties.

Domestic prices of steel continue firm and most mills have booked orders for the next five to six months. At the present price level, mills find a satisfactory margin of profit, which is leading them to seek further domestic orders rather than to compete for export business. This situation is aiding in bringing export prices to a higher level. The strike of dock workers at Antwerp and Rouen caused some temporary delays in shipments abroad, as it confined French shippers to the port of Dunkirk, but this strike has ended and normal conditions again prevail.

Japanese Market Shows Improvement

Prices Well Maintained Despite Imports—Domestic Tin Plate Output Increases

The report of A. Cameron & Co., Kobe, Japan, on Japanese business conditions in June is rather optimistic. It is pointed out that the yen has become fairly stable at about 46½c., which is considered low, as trade returns are rapidly improving and the yen should be at about 47½c. The low rate of the yen is attributed in part to the abnormal conditions in the money market, where call rates have steadily declined until the banks are filled with funds and soon may be compelled to lower their interest rates on deposits.

Black sheets have been in active demand, total arrivals during May being 16,541 tons, more than double the total of April. Of these, 9729 tons came from Great Britain, 4899 tons from the United States, 1396 tons from Germany, 314 tons from Belgium, 5 tons from Sweden and 198 tons from other countries. The large receipts of black sheets in May were something of a surprise, although it is known that small trial orders have been placed by the galvanizers with Belgian, Swedish and other foreign mills. Prices early in the month

were fairly firm, but the large arrivals brought about an easier tendency despite improvement in demand from consumers. At the end of June the market prices on black sheets were 72.50 sen (32.63c.) per sheet for British material; 74.50 sen (33.53c.) per sheet for American and 71.50 sen (32.18c.) per sheet for Kawasaki Dockyard Co. sheets.

With Japanese mills devoting more attention to the manufacture of ordinary sizes of tin plate (14 x 20 in.), some decline in the importation of foreign material seems to be expected. To replace this, an increase in demand for tin plate scrap is developing. The Government Works is steadily increasing its production and unless foreign makers find it possible to meet this competition, in a few years Japan may be importing but very little tin plate. At the end of June American tin plate was selling in this market at 12.20 yen (\$5.52) per 100 lb. base box, British tin plate at 11.80 yen (\$5.34) per base box and domestic tin plate from the Government Works at Yawata at 11.25 yen (\$5.09) per base box.

During June there was a sudden increase in activity in steel bars, speculators being active in the belief that local strikes of stevedores would obstruct the importation of the raw materials for the Government Works and that stocks would be considerably depleted. The strikes, however, were of short duration, with the result that speculators were left with material on their hands. Demand is good and the Government Works has advanced its quotations for future deliveries by 4 yen (\$1.81) per ton. At the end of June steel bars were quoted by the domestic interest at 96 yen (\$43.24) per ton with foreign material at 98 yen (\$44.35) per ton; domestic angles 95 yen (\$42.99) per ton and foreign 100 yen (\$45.25) per ton; domestic beams 89 yen (\$40.27) per ton and foreign 97 yen (\$43.89).

German Company Builds American Aircraft Motors

HAMBURG, GERMANY, July 14.—The Bayrische Motorenwerke, which recently bought the rights for Germany of the American patents covering the "Wasp" and "Hornet" type aircraft motors, is now offering these motors in Germany. Many parts of these motors are being built of "electron," which is said to reduce their weight by as much as 38 per cent.

American Mills More Active for Export

Reported Competing for Japanese Structural Orders—Foreign Steel Marking Considered Here

NEW YORK, July 31.—Export business continues small, but in the past few weeks, it is pointed out by exporters to South American markets and the Far East that American mills seem to be exhibiting more interest in foreign orders than for some time. While there is less evidence of severe competition among mills in the United States, they are reported to be willing to quote prices calculated to secure orders, particularly on bars and shapes.

On tin plate business with Japan, American makers have been rather successful in securing recent orders, but in competing with Welsh mills in South America, as occurred a few weeks ago for a small tonnage of tin plate, they have not been able to submit the lowest bids. About 5200 base boxes of oil can tin plate for the Tokuyama Fuel and Arsenal Department of the Japanese Government have been awarded to a Japanese export house in New York. The provision department of the Japanese Army is expected to open bids about the end of August on about 20,000 base boxes of canners tin plate.

While there is a fair volume of small lot business coming to this country from Japan, orders for light gage black sheets for such large users as galvanizing plants, are small and are expected to continue rather limited for a time as a result of the present boycott of Japanese goods by the Chinese. The political situation that has developed from the divergent views of the Japanese and new Chinese Nationalist Governments over Manchuria, is reported to have resulted in a refusal of many Chinese to handle or use either Japanese products or foreign products handled by Japanese traders. While this might appear to be a condition that would react to the advantage of American exporters and mills, who could transact business direct with the Chinese buyers, it is pointed out that the Japanese trading companies usually handle the credits and financing of sales of American material to China.

Imported Steel Quiet

Importers in New York report a good volume of inquiry for steel bars, structural material, hoops and bands, but not much business has developed as yet. Steel prices continue substantially unchanged at 1.78c. to 1.80c. per lb., base, on plain steel bars, delivered New York, and about 1.68c. per lb. on beams, delivered New York. Consumers have recently shown an interest in wire and wire nails, but no business of consequence is reported to have been closed.

Recently importers of foreign steel have received notifications from the United States Treasury Department that at the protest of a large inde-

pendent steel company their arrivals of foreign bars, shapes and similar material were being investigated for markings of country of origin. For

the past five years or more it has been the practice to bring in such heavy steel material without marks showing the country in which it was manufactured and this is based by the importers on Treasury Decision No. 10,600 made in 1923. Under this decision, it is not necessary to have foreign steel such as plates, shapes, bars and similar heavy material marked.

Youngstown-Ohio River Link Approved

Report to Interstate Commerce Commission Recommends Construction of Branch Line—Decision Not Final

WASHINGTON, July 31.—Construction of two branch lines by the Pittsburgh, Lisbon & Western Railroad, which would afford the Youngstown district direct connection with the Ohio River, was recommended in a proposed report to the Interstate Commerce Commission made public last Friday. The report was prepared by C. V. Burnside, assistant director Bureau of Finance of the commission. He also recommended that the Montour Railroad be granted authority to acquire control of the Lisbon by purchase of its capital stock. The request of the Lisbon for permission to retain the excess earnings from the new construction, the assistant director held, should be denied. Both the Montour and the Lisbon railroads are controlled by the Pittsburgh Coal Co.

The recommendations of the assistant director are victories not only for the applicants, but also for iron and steel interests in the Youngstown and surrounding territory, who strongly intervened on behalf of the application for construction of new lines of the Lisbon. They insisted that connection of the Youngstown district with the Ohio River was necessary if the Youngstown district is to compete successfully with the Pittsburgh district steel industry. It was declared that, by reason of rail and water service through the Monongahela, Allegheny and Ohio rivers, the Pittsburgh district enjoys lower assembling costs on inbound raw materials, as well as on outbound finished products to the South and Southwest, than does the Youngstown district, which now has no water service.

Youngstown District Handicapped

The Youngstown district, it was claimed, has been suffering greatly from these handicaps and as a result has yielded second place as a steel center to the Chicago district. It was contended that, with river connection for the transportation of coal from the Pittsburgh and Connellsville district to the Youngstown district and of steel products from that district to the markets of the South and Southwest, rates would be lower than at present and the district placed on a more nearly even competitive basis with the Pittsburgh district.

Representatives of the Youngstown Sheet & Tube Co., the Republic Iron & Steel Co., and the Sharon Steel Hoop Co., as well as the city of Youngstown, appeared as witnesses at the hearing on the application of the Lisbon and strongly supported testimony given by the applicants.

Trunk Lines Oppose New Road

Opposition to the applications was vigorously expressed by trunk line carriers serving the Pittsburgh district, including the Pennsylvania, Baltimore & Ohio and Pittsburgh & Lake Erie railroads. In substance, they insisted that the new lines are not necessary and that the service desired by the Youngstown district can be made available through hook-ups with the Pennsylvania and Pittsburgh & Lake Erie lines.

To this the intervening steel interests responded that they had for a long number of years endeavored to have the trunk lines make such a connection, but without success. The trunk line carriers also insisted that estimates as to the cost of the new construction were too small. The assistant director, however, said that engineers of the trunk line carriers had based their estimate of \$8,600,000 for the new branches, without equipment, on the basis of construction like that of the trunk line carriers, whereas it is proposed to follow costs of construction of the line of the Montour. The applicant's estimate was about \$3,500,000 less than that of the trunk line engineers' estimate and would average about \$206,000 per mile.

The next step in the proceeding probably will be the filing by the defendant interveners of exceptions to the assistant director's findings, followed by arguments by the commission previous to its decision.

On July 1, American shipyards were building, or were under contract to build, for private shipowners, 396 steel vessels of 225,740 gross register tons, compared with 413 steel vessels of 223,147 gross tons on June 1, according to the Bureau of Navigation, Department of Commerce.

Scrap Dealers Form an Institute

Organization Patterned After Such Associations in Other Lines Will Work for Improved Trade Conditions

THE Institute of Scrap Iron and Steel has been organized by the members of the Eastern Scrap Iron Association and will function along lines similar to those adopted by such organizations as the American Iron and Steel Institute and the Copper and Brass Research Association.

Aims of the new organization include the elimination of unfair and unprofitable business practices, the elimination of waste and the raising of the business to a more dignified and profitable level. The adoption of a code of ethics is a part of the immediate program.

In commenting on the relations between scrap dealers and consumers, Benjamin Schwartz, Baltimore lawyer, who was recently appointed director general of the scrap institute, said:

"I have heard some talk of arbitrary rejections by the mills. It occurs to me that the mills, too, may have their complaints against the scrap iron business. They should welcome an association of this kind, with a centralized responsibility to which they can turn for the dissemination of information, the correction of evils and complaints, and for cooperative effort in the interest and for the benefit of the entire steel industry."

The new institute purposes to function along the following lines:

The fostering of good will with the trade itself and promoting better understanding with consumers and producers.

Standardization of specifications so far as is practicable. A campaign of education is to be carried on among the members in an effort to eliminate the causes of rejections by the mills, due to lack of information.

Gathering of information and statistics concerning conditions in the industry and discussion of these facts at regular periods, with the aim of substituting knowledge for guesswork.

Adoption of a code of business ethics for the elimination of unfair, undesirable or unprofitable trade practices.

Study and standardization of trade customs, including uniform contracts, terms, deliveries, etc.

Arbitration of disputes through a properly constituted commission.

Establishment of a traffic bureau for the information of the dealer and adjustment of his transportation problems.

Organization of a credit service.

One of the things to which the institute will give attention is that of cost accounting in the scrap business. It is stated that few dealers know accurately the costs of handling scrap.

Eleven chapters will be organized, one each in the following cities: New York, Newark, Jersey City, Buffalo, Syracuse, Boston, Hartford, Philadelphia, Reading, Baltimore and Pittsburgh. David Strauss of the Continental Iron & Steel Co., New York, as chairman of the committee on membership, is supervising the organization of these chapters.

Officers of the Eastern Scrap Iron

Association, which has organized the institute, are as follows: President, Joseph G. Hitner, Henry A. Hitner's Sons Co., Philadelphia; vice-presidents, J. V. S. Bishop, Bishop & Co., Philadelphia; David Strauss, Continental Iron & Steel Co., New York; Ben Cohen, Louis Cohen & Son, Wilkes-Barre, Pa.; Stanton L. Dreifus, S. Snyder Corporation, Rochester, N. Y.; David Pollock, of firm of Mayer Pollock, Pottstown, Pa.; secretary,

Foundrymen of Central Illinois Organize

The Central Illinois Foundrymen's Club was organized at a meeting held at Springfield, Ill., on July 2. Officers elected are: President, H. R. Hire, Hire Foundry Co., Peoria; vice-president, M. W. Baker, Illinois Foundry Co., Springfield; treasurer, Franklin Whitehead, Meadows Mfg. Co., Bloomington. The club is composed of gray iron foundries in the central Illinois district.

Carbon Furnace to Be Scrapped

The plant of the Carbon Furnace Co., Ltd., Parryville, Pa., has been sold to Harry Orkin of Slatington, Pa., and the stack will be dismantled. The furnace, which is one of the oldest in eastern Pennsylvania, was built in 1869 and rebuilt in 1898. It has an annual capacity of 40,000 tons, but had not been operated since 1923.

Heavier Pig Iron Imports in June

IMPORTS of pig iron in June are reported by the Department of Commerce at 11,799 gross tons, compared with 9732 tons in May. Both figures are far below the April total of 20,845 tons. The June figure may be compared with 13,497 tons received in June, 1927. For the half year there has been a gain of about 15,000 tons, compared with last year.

Receipts of pig iron from Great Britain were practically three times

Herman Moskowitz, M. Samuel & Son, Inc., New York; treasurer, Thomas F. Kelly, Brooklyn.

Members of the executive committee are: Max Meltzer, Hausman & Wimmer Co., Pittsburgh; Allen R. Hoffer, Allen R. Hoffer Co., Philadelphia; Morris Shapiro, Boston Iron & Metal Co., Baltimore; Howard L. Warner, Frank Samuel & Co., Philadelphia; Max Fehheimer, Fehheimer Iron & Steel Co., Allentown, Pa.; Sam Jacob, Jacob Brothers, Bridgeport, Conn.; M. Bonomo, L. Schiavone & Bonomo Brothers, Inc., Jersey City, N. J.; A. Lipman, New York Scrap Iron & Steel Co., New York; Abraham Isaac, Elizabeth, N. J.

as heavy in the first half of 1928 as a year earlier. An increase of 23,000 tons from that source was partly offset by a reduction of more than 7700 tons in shipments from Germany, which country has almost disappeared as a supplier of pig iron to the United States market. British India holds the position second to Great Britain for the six months, the two countries accounting for considerably more than 75 per cent of the total imports. The Netherlands stands in third place. Details of the June receipts and of those of the first six months, for 1928 and 1927, are given in the table.

Alabama City Furnace Being Rebuilt

The Gulf States Steel Co., Birmingham, is dismantling its blast furnace at Alabama City, Ala., and will rebuild stack along improved lines incorporating Dovel features. Also coal handling equipment will be added. Dwight P. Robinson & Co., Inc., New York, is the engineer in charge and the Reeves Brothers Co., Alliance, Ohio, is fabricating the steel hull.

At a meeting of the trustees of the Massachusetts Gas Companies in Boston last week no mention was made in regard to the purchase of the properties by the Koppers Co., Pittsburgh. President Richards of the Boston companies will, it is expected, make some sort of an announcement before long regarding the status of negotiations with the Koppers Co.

This Issue in Brief

Production costs cut sharply by elaborate network of mechanical conveying systems. Electric refrigerator manufacturer uses 44 different conveying units, which have made possible a permanent decrease in the amount of man power; at the same time providing steady movement of materials in whatever quantities are called for by production schedules.—Page 265.

* * *

Removing strains from gray iron castings is best done by heating at temperatures considerably below the critical temperature for periods of time depending upon the size and section of the castings. The object is to heat the casting throughout at the annealing temperature, and then to cool slowly.—Page 285.

* * *

American machinery is increasingly popular abroad. During first half of 1928 foreign customers bought close to 240 million dollars worth of our machines, a gain of 13 per cent over total for same period of 1927.—Page 332.

* * *

Purchasing agents vie with each other to reduce salesmen's lost time. Automobile manufacturer keeps a record of the time each salesman is kept waiting and provides each buyer with a daily report, as a means of encouraging buyers to save salesmen's time.—Page 285.

* * *

Export steel business shows healthy gain. Rolled steel exports for June were 29 per cent above same month of last year. Shipments for first half of 1928 totaled 954,044 gross tons, a gain of more than 4 per cent over same period of 1927. Rolled steel imports increased about 1 per cent.—Page 293.

For best results in automatic welding, use a rapidly melting electrode, says welding machine manufacturer. Electrode which will do the required job at the highest speed should be selected, he says. This depends not only on the melting rate of the electrode, but also on the electrode diameter and welding current.—Page 277.

* * *

Blowing ore and fuel into blast furnace proves unsuccessful. The process lowers the temperature, and therefore is economical only when the furnace is working with a great excess of temperature.—Page 276.

* * *

Youngstown steel producers score a point in fight to get rail link between Youngstown and Ohio River. Commerce Commission examiner submits favorable report to commission, but trunk line railroads will object. If link is built it will give Youngstown producers the benefit of low-cost water transportation, and will enable them to compete for Southern and Southwestern business.—Page 297.

* * *

Standard tote pan is adopted for carrying small parts on conveying system. Holders, fitting snugly into the tote pans, are provided for each kind of part used in refrigerator plant. Workmen remove the holders, but not the pans themselves, from the conveyor.—Page 270.

* * *

Steel casting manufacturer's laboratory is equipped for steel making. In addition to the usual equipment for determining physical properties of specimens, laboratory in Midwest plant has special melting furnaces, to manufacture experimental steels and alloys.—Page 281.

Avoid long arc in automatic welding, says welding manufacturer, for it usually results in a poor weld. With a short arc there is a greater heat concentration, he says. The longer the arc the more opportunity there is for absorption of oxygen and nitrogen by the weld metal.—Page 277.

* * *

Carbon deposition near blast furnace top is not due to coke. Tests indicate that blast furnace gases are accountable.—Page 271.

* * *

Rolling mill capacity has increased sharply in past five years. The gain is about 21 per cent. Pittsburgh district leads with 27 per cent of the total capacity and Chicago district is next, with about 19½ per cent.—Page 272.

* * *

Will it be cheaper to weld by hand or to weld automatically? To answer this question, calculate the cost per running foot. That can be done by following the formula given on page 279.

* * *

Annealing gray iron castings to improve machinability should be done at 1450 to 1550 deg. Fahr., followed by slow cooling. However, the decrease in hardness is accompanied by loss in strength.—Page 284.

* * *

Decline of 3.8 per cent in July daily pig iron output. Estimated production was 98,834 tons a day, compared with 102,733 tons in June. Number of furnaces in blast Aug. 1 was 185, which was four less than on July 1.—Page 303.

* * *

Business activity may recede a little further, says Dr. Haney, but the recession will not be much more than seasonal, and is likely to be followed by a period of irregular stability.—Page 290.

THE IRON AGE

ESTABLISHED 1855

W. W. MACON
Managing Editor

Self-Government in Business

TRADE organizations, which have so multiplied in the last three years, have found a field of large usefulness in developing equitable business practices. In earlier years such associations existed in the shadowy fringe of the Sherman act, and even an expert counsel could not be sure that certain acts were legal. The Supreme Court decisions of 1925 cleared up the situation materially, with the result that co-operative and coordinating movements gathered momentum in all the ramifications of industry and trade. By informing the Federal Trade Commission and the Department of Justice of their activities, actual and proposed, the associations now move forward on definite lines, their freedom of action being restricted only in respect to agreements on prices that might be considered in restraint of trade.

Association members probably get the most tangible results from the interchange of information about production, stocks, distribution, competitive lines, cost keeping and credits. Governmental departments and bureaus find them the easiest and promptest sources of information about industry and the best avenue through which to approach such matters as standardization and simplification of practice. The public generally will be benefited by more stable business conditions, by improved quality of goods and by better trade practices.

It is this last item that is worthy of more remark. As an instance take furniture. Not so long ago a table made of painted gum wood with a little mahogany veneer on the top was sold as "mahogany furniture." When the dealers were reproached for this evident misbranding they replied that they were only doing what every one was doing and had been doing for years. They admitted that the practice was bad and would be glad to change it, but "the manufacturers would never agree." When the manufacturers were seen they told the same story of how they would like to reform, but they knew the dealers would never agree.

Obviously it was then a simple matter to get representative manufacturers and retailers into a conference and end misrepresentation in furniture. Such a stipulation on the branding of furniture has now been signed by more than 90 per cent of the industry. The result is unquestionably wholesome and redounds to the interest of the consuming public as well as of the trade. Truth in branding and advertising is a matter almost worthy of governmental regulation, but can be handled so much better by mutual consent.

Instances might be multiplied of long established practices, just over on the shady side, which have

been abandoned by reputable firms at the behest of their business associations. Of course, there will always be some non-cooperating firms who mistakenly think there will be selfish advantage in disregarding the general good. But once a trade practice is freely recognized as wholesome by an overwhelming majority of the members of an industry, as represented in a trade organization, it readily becomes a part of the code under which that industry practices self-government. And as we all know, government from within is far better than from without.

Must the Heat Treater Sweat?

IT is undoubtedly true that the recommended quenching temperatures for alloy and tool steels have been steadily rising during the past ten years. Furthermore, while a complicated treatment consisting of two or more heatings was once a rarity, the metallurgist today does not hesitate to specify it on many parts of extra duty or value. Even for so recently marketed a product as stainless steel, the makers are now telling their customers to quench it from a heat 100 degrees above what was usual when it was first exploited. The point is that the higher heat facilitates a higher saturation of chromium in the iron with a correspondingly better resistance to corrosion.

With these increasing temperatures furnace designers and the makers of refractory brick and heat resisting metals have had problems thrust upon them. Generally speaking, these new demands have been met, even if the cost at times has seemed excessive. Numerous special alloys for electrical resistors, furnace bottoms, and pots have been developed, and the purchaser usually has merely to balance the economies of a higher first cost against the longer life.

Higher temperatures also put a greater strain upon the heat treaters themselves; but it almost seems that they have been the last factor to receive consideration. One would imagine, on entering some heat treatment departments, that the management must think these skilled members of the organization are birds like the fabled phoenix, which flew out of an altar fire with never a tail feather singed. Else why would any one install heat-treating equipment operating at somewhere up to 2500 degrees Fahrenheit, blowing off white-hot furnace gases into a work room already superheated by a blazing summer sun? We find such operations in plants where it is evident from the variety of equipment, labor saving devices, and quality of work done, that much thought has been given to this important operation. Yet the men all have "sun-burned" noses and cheek bones. Perhaps a certain pride that they can

stand any heat which would wither a thin-skinned machinist keeps them at the sizzling job!

It has been said that the furnace gases should play around the rim of a lead pot in order to keep a crust from forming, and that the products of combustion should blow out a muffle door to guarantee a neutral atmosphere within. Even if this is true, it would not prevent building a generous hood with a vigorous suction fan to exhaust the gas. Nor would it prevent building brick flues to take away the gases from the larger stationary furnaces.

In fact, wherever large output is required, as in the Ford or Dodge factories, the manager does not hesitate to put a battery of furnaces right in the production line, flanked on either side by precision machine tools or other finishing operations.

Here the heat treater gets relief. He might well have first consideration in such installations; but the chances are the dust and smoke and heat were abolished because they don't mix at all well with good machine shop practice.

It would not be surprising to find that these smokeless, noiseless, heatless, heat-treating furnaces are more economical in the end than the more primitive types. A lower labor turnover and a better *esprit de corps* would overbalance a considerable increase in installation and maintenance expense. When all factors are considered, the best is always cheapest.

A Constructive Move in Sheets

AN important producer of sheets announces this week that after Oct. 1 its terms of payment will be 30 days net or one-half of 1 per cent discount for payment within 10 days of the date of the invoice. There are indications that like action will be taken by other sheet manufacturers, with the probability that in time the shortened discount will be as common in that branch of the industry as is now the 2 per cent that has been the practice for many years. Coming after a long series of efforts to advance sheet prices—efforts whose success has been rather in inverse proportion to the sheet trade's notorious need of a better profit—the new move takes on a significance beyond that ordinarily given to a detail of settlement between the buyer and the seller.

It is pointed out on behalf of the manufacturer that if the new discount on sheets becomes generally effective, all finished steel products would be on that basis apart from steel pipe, wire, tin plate and cold rolled strips. That is to say, as plates, shapes, bars and some other products now take but one-half of 1 per cent, there would be left slightly more than 25 per cent of the total of rolled steel subject to the 2 per cent discount.

It is further urged that this latter discount is the survival of the practice of the earlier years of long and uncertain credits, of wide swings in volume and prices, and of extreme fluctuations in the money market. Also, that 2 per cent for a 20-day anticipation of payment is equivalent to 36 per cent a year as against 9 per cent under the new arrangement—a rate which still gives a margin to the buyer who borrows to discount his bills.

The question will be raised whether there will be better success in establishing the short discount than

sheet manufacturers have had in advancing the market price of their product. Conditions seem to favor an affirmative answer. One consideration is that it is easier to secure general adhesion to a change in trade practice than to maintain a definite market price. Thus, two years ago makers of sheets recognized that selling prices had long been out of alinement with costs, heavy gages yielding a profit, while market prices on light gages represented bare cost or less than cost. After protracted effort, which involved scientific cost finding, No. 24 gage was made the base for black and galvanized sheets instead of No. 28 gage, and differentials were recast in line with rolling mill costs—an arrangement that promptly found acceptance throughout the trade. The net result of larger spreads on light gages and of reductions on some heavier gages was to establish the industry on a sounder basis, with somewhat better average return to mills rolling the full range of black and galvanized sheets.

It is significant that this week's move to better conditions in the sheet industry has for its background more than six months of sustained effort, in large part successful, to advance the heavier products—plates, shapes and bars—above the unprofitable level reached in the second half of 1927. Another factor of which account is to be taken is that a number of manufacturers of bars, plates and shapes have been at work on lines similar to those followed in the sheet industry two years ago, with a view to bringing extras for chemical content and for cutting and other services into better alinement with relative cost of production.

Westward Migration in Steel
